This course trains students to educate their peers about sexual and relationship violence and stalking. Students will explore how this violence impacts people of varying cultures including people of color and the gay, lesbian, bisexual, and transgender community. They are taught to be social activists and learn skills to be confident and active bystanders as well as knowledgeable and effective facilitators. Topics include learning about the objectification of women and men in the media, masculinity and patriarchy, pornography, and how these all contribute to a rape culture. Upon successful completion, students will be ready to be a Movement peer educator. Student must complete application and interview process and have been approved by the instructor prior to registration in the course.

**ECD 224 Student Development and Peer Mentoring 2.**
Prerequisite: Selection as a Peer Mentor.
For new student peer mentors of primarily African American freshmen. Relevant student development, psychology and counseling research and theory as well as shared professional experiences are presented. Class discussion, group activities, role playing, relevant readings and video are employed. Reaction papers and project are required.

**ECD 225 Foundations of Cultural Competence 3.**
This course engages students in the process to work effectively with diverse populations to develop cross-cultural competencies and identify culturally-appropriate strategies in the workplace and life. This course introduces multicultural and international diversity concepts while having students participate in reflective and experiential activities. Students gain an overview of historical and psychological conceptual frameworks and models for understanding cultural differences and similarities within, among, and between groups of people domestically and internationally. Sophomore standing or above.

**ECD 296 Special Topics in Education: Counselor Education 1-3.**
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

**ECD 510 Introduction To Counseling 3.**
Prerequisite: Six hrs. in ED or PSY.
Introduction to counseling with a focus on three settings: schools, college and community agencies. Exploration of issues of theory, practice and research with regard to children, adolescents, college students and adults. Personal and professional exploration encouraged through use of psychological tests.

**ECD 524 Career Counseling and Development 3.**
Prerequisite: Six hrs. in ED or PSY.
Knowledge and skills needed to: (a) provide professional career counseling to individuals and (b) design, implement and evaluate career development programs for particular groups. Theories of career development and decision making; career guidance programs in educational, agency and industrial setting; career information sources and delivery systems; and assessment in career counseling.

**ECD 525 Cross Cultural Counseling 3.**
Prerequisite: Six hrs. in ED or PSY, Corequisite: ECD 530.
Theory and practice of counseling culturally different clients. Client populations include African Americans, Asian-Americans, American Indians and Hispanics. Cultural assumptions, cultural values, counselor credibility, prejudice and racism in context of counseling.

**ECD 530 Theories and Tech of Counseling 4.**
Prerequisite: Six hrs. in ED or PSY.
Theory, philosophy, roles, professional ethics, and techniques of counseling. Eleven major counseling approaches including behavioral, psychoanalytic, client-centered, existential, family and post-modern approaches, and related counseling strategies are discussed. Students have opportunities to practice related strategies through role-plays.

**ECD 533 Int Sch Counseling 4.**
Prerequisite: Graduate standing.
An examination of the conceptual framework for the role and functions of school counselors, prevention and treatment strategies, program development and evaluation. Focus is on the school-college-community collaboration model, preparing counselors who can work effectively across different counseling settings by collaborating with other counselors and mental health professionals. Graduate standing required.

**ECD 534 Guidance and Counseling In Elementary and Middle Schools 4.**
Prerequisite: Graduate standing.
Examination of (1) theoretical framework for roles and functions of elementary and middle school counselors, (2) primary and secondary prevention strategies and (3) evaluation and administration procedures to develop and implement model programs forelementary and middle schools.

**ECD 535 Introduction to College Counseling and Student Development 4.**
Prerequisite: Graduate standing or PBS status.
College Counseling and student development theory, research and practice as well as overview of profession. Discussion of counselor roles, professional ethics, history, identity, and development. Instruction in and design of structured group work in laboratory.
ECD 536 Introduction to Clinical Mental Health Counseling 4.
Prerequisite: Graduate Standing.
Issues, functions and scope of work being done in various clinical mental health programs; overview of helping approaches with selected client populations; related professional concerns. Instruction in and design of structured group work in laboratory.

ECD 539 Group Counseling 3.
Prerequisite: ECD 530 and one of the following: ECD 510, 534, 535 or 536.
Theory and practice of group counseling. Theoretical positions include client-centered, behavioral and rational-emotive. Aspects of group process include group leadership, group membership, establishing and maintaining a group.

ECD 540 Gender Issues In Counseling 3.
Prerequisite: Graduate standing or Six hrs. in ED or PSY.
Exploration of gender as primary identity and social construct. Emphasis on gender dynamics in counseling, client empowerment and preventive approaches.

ECD 543 Introduction to College Counseling 3.
Prerequisite: ECD 535 or Doctoral student.
A course designed for investigation of college counseling services and strategies. Assessment and research in student development, and students design and implement a developmental intervention based on Knefelkamp and Wells’ Practice-to-Theory-to-Practice model.

ECD 550 Research and Assessment In Counseling 3.
Prerequisite: Graduate standing.
Research and assessment issues in counseling. Emphasis on writing research proposals in counseling and critiquing articles in counseling research. Exploration of meaning and importance of assessment in counseling. Examination of research designs in counseling.

ECD 561 Strategies for Clinical Assessment in Counseling 3.
R: Graduate Students Only.
Exploration of meaning and importance of assessment in the counseling process. The utilization of counseling assessments based on legal and ethical guidelines and cultural considerations. Identity, interpret, and explain assessments in clinical, college, and school counseling settings.

ECD 562 Techniques in Counseling 4.
Prerequisite: ECD 530.
In this course students work towards mastery of counseling skills, review relevant theories, and prepare for Practicum. Students will practice counseling skills in class and spend their out of class lab hours practicing skills in partnering schools. Students will do some limited video taping of counseling sessions and receive feedback on tapes from Counselor Education doctoral students taking their supervision theory class.

ECD 590 Special Problems In Guidance 1-6.
Prerequisite: Six hrs. grad. work in dept.
For individual or group studies of one or more of major problems in guidance and personnel work. Problems selected to meet interests of individuals. Workshop procedure used whereby special projects, reports and research developed by individuals and by groups.

ECD 620 Special Problems In Guidance 1-6.
Prerequisite: Six hrs. grad. work in dept.
For individual or group studies of one or more of major problems in guidance and personnel work. Problems selected to meet interests of individuals. Workshop procedure used whereby special projects, reports and research developed by individuals and by groups.

ECD 641 Introductory Practicum in Counseling 1.
Prerequisite: ECD 530, 525.
Student participation in introductory supervised individual and group counseling experiences in laboratory setting.

ECD 642 Practicum In Counseling 3.
Prerequisite: ECD 641.
Student participation in individual and group counseling and consultation experiences under supervision in a school, college or agency setting. Prerequisite: 1. Completion of all ECD, PSY, and STAT courses with exception of ECD 539 Group Counseling that may be taken concurrently. [Other classes that could be taken concurrently PSY 535, 582, 584, 475, 476] 2. Consent of concentration coord.

ECD 651 Internship in School Counseling 6-12.
Prerequisite: ECD 642.
A 600-hour internship for school counselors in training in a school setting under the supervision of qualified professionals. Students perform a variety of activities expected to school counselors. Weekly meetings with faculty and on-site supervisors.

ECD 652 Internship In College Student Development 6-12.
Prerequisite: ECD 642.
A 600-hour internship. Professional experience in student affairs department with on-site supervision from qualified professional. Expectations including employment of broad repertoire of skills in roles of counselor, student development educator and administrator. Weekly student meetings with faculty and on-site supervisors.

ECD 653 Internship In Clinical Mental Health Counseling 6-12.
Prerequisite: ECD 642.
A 600-hour internship for community agency counselors in agency counseling setting under supervision of qualified professional. Employment of broad repertoire of primary and secondary prevention approaches to individual and group techniques, workshop leadership skills, consultation techniques and advocacy methods. Weekly meetings with faculty and on-site supervisors.

ECD 692 Research Projects in Counselor Education 1-3.
Prerequisite: ELP 532.
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students’ interests and not to be part of thesis or dissertation research.

ECD 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

ECD 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

ECD 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

ECD 699 Master’s Thesis Preparation 1-9.
Prerequisite: Doctoral student.
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their theses.
ECD 731 Career Development Theory and Research 3.
Prerequisite: ECD 524, ELP 532 and PSY 535.
Analysis of theory and research in career development and work adjustment as basis for intervention (career counseling, curricular, organizational) as research.

ECD 732 Advanced Multicultural Counseling 3.
P: ECD 525 or equivalent.
Course focuses on the personal and professional development of the students as human beings, global citizens, counselors, and pre-service counselor educators. It is intentionally designed to promote critical self-analysis, cultural understanding, and personal and collective growth and change through honest and respectful discussions, readings, and assignments. The course is grounded in the study of multicultural and counseling theories that emphasize the relevance of social and cultural context and advocacy roles of counselors.

ECD 733 Cognitive-Behavioral Theory, Research, and Practice 3.
Prerequisite: ECD 737, Corequisite: ST 700.
Behavioral and cognitive behavioral change methods and research supporting their efficacy in counselor education. Major focus on synthesis of cognitive-developmental and cognitive-behavioral methods.

ECD 735 Counseling Supervision: Theory and Research 3.
Prerequisite: Doctoral student.
Examination of conceptual and methodological issues relating to supervision and evaluation of novice counselors. Special emphasis on developmental supervision approaches.

ECD 736 Advanced Assessment in Counseling 3.
Prerequisite: PSY 535 or equivalent.
Doctoral students will have learning experiences beyond the entry-level master's degree models and methods of assessment. Content focuses on advanced applications of assessment principles in clinical counseling and supervision practice, program evaluation, and outcome and action research studies. Students will demonstrate mastery of foundations of tests and measurement, present advanced assessment content modules during class sessions, and present documented and oral reports on personal quests for advanced knowledge in chosen assessment domains.

ECD 737 Cognitive Developmental Theory, Research and Practice 3.
Prerequisite: Doctoral student : PSY 535, ST 507, Corequisite: ST 508.

ECD 738 Research in Counselor Education 3.
Prerequisite: Doctoral student : ST 507; PSY 535, Corequisite: ST 508.
Instruction in required skills and knowledge to conduct research in counselor education, including narrative and quantitative integration of research, experimental and quasi-experimental designs, analogue and process research, single subject and descriptive designs, and qualitative research. Preparation of narrative and meta-analytic research review and research proposal with oral presentation.

ECD 740 Advanced Psycho-Social Identity Development: Race, Gender, and Culture 3.
Prerequisite: ECD 540; ECD 525 ; Post-master's degree students.
Meanings and intersections of gender, race and culture. Advanced theories and research related to counseling practice. Sexuality, disability and class and implications for counseling. Case study, personal narratives and video segments expand on course readings.

ECD 790 Special Problems In Guidance 1-6.
Prerequisite: Six hrs. grad. work in dept.
For individual or group studies of one or more of major problems in guidance and personnel work. Problems selected to meet interests of individuals. Workshop procedure used whereby special projects, reports and research developed by individuals and by groups.

ECD 820 Special Problems In Guidance 1-6.
Prerequisite: Six hrs. grad. work in dept.
For individual or group studies of one or more of major problems in guidance and personnel work. Problems selected to meet interests of individuals. Workshop procedure used whereby special projects, reports and research developed by individuals and by groups.

ECD 843 Advanced Counseling Practicum 3.
Prerequisite: Doctoral student, ECD 642.
Participation of doctoral-level students with previous counseling experience in advanced, supervised counseling experience.

ECD 847 Internship in Supervision 3.
Prerequisite: ECD 735.
A supervised internship for doctoral students in assisting with the supervision of first-year students in laboratory and practicum experiences in individual and group counseling and consultation.

ECD 850 Doctoral Internship 1-9.
Prerequisite: Nine hrs. in grad. level courses.
Utilizing participant-observer role, participation required in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Student required to develop possible alternative courses of action in various situations, select one of the alternatives and evaluate consequences.

ECD 860 Professional Issues In Counseling 1-3.
Prerequisite: Doctoral student.
Consideration of contemporary issues, trends and recent research in field of counseling.

ECD 866 Internship in Teaching in Counselor Education 3.
Prerequisite: Doctoral student.
Using the participant-observer role, this course requires participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing counseling and teaching experiences, identifying critical incidents in counseling and teaching, and predicting consequences of counseling and teaching interventions.

ECD 892 Doctoral Research Projects 1-3.
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students’ interests and not to be part of thesis or dissertation research.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.
ECD 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

**Crop Science (CS)**

**CS 101 Field Crop and Turfgrass Management Orientation 1.**
Introduction to NCSU and the Agricultural Institute with an emphasis on areas related to Field Crops Technology and Turfgrass Management. Students will explore university, college, and departmental resources, academic policies and procedures, career opportunities, and current trends and issues in our related disciplines. Students cannot receive credit for both CS 10 and AGI 10. FCT or TGM only.

**CS 103 Introductory Topics in Crop, Soil and Turfgrass Sciences 1.**
Introduction to the scope, purpose, and objectives of a university education with an emphasis on areas related to Crop, Soil and Turfgrass Sciences. Students will explore university, college and departmental resources, academic policies and procedures, opportunities for minors, career opportunities, and current trends and issues in our related disciplines. Students cannot receive credit for both CS 103 and ALS 103. Freshman Only; PAA, PAB, PAC, PAE, PCB, SST, TFG.

**CS 111 Field Crop Production 4.**
Management of field crops, including growth and development, establishment, pest management, environmental considerations, rotations of crops and chemicals, harvesting, storage and marketing. SPEARS.

**CS 121 Turfgrasses and Their Uses 3.**
An introduction to turfgrass species and their uses. Emphasis on: size and scope of the turfgrass industry, basic concepts of grass growth and development, characteristics of cool- and warm-season turfgrasses and their use for golf courses, lawns, athletic fields, and other applications. Techniques for successful establishment and maintenance of turfgrass areas. SPEARS.

**CS 122 Principles of Turfgrass Management 3.**
An examination of cultural practices essential for management of high quality turfgrass areas. Topics include: function of plant nutrients, fertilizer characteristics and application techniques, irrigation programming, construction of high use turfgrass areas, calibration of spreaders and sprayers, aeration, pesticide fate and developing effective management systems. ERICKSON.

**CS 124 Agriculture and Seeds 2.**
This course will explore seeds, their importance in local and global agriculture, new biotechnology applications for agriculture, how biotechnology has changed the seed industry and agriculture, how seeds deliver new AG biotechnology discoveries and how seeds and biotechnology are addressing world hunger issues. Field trip is required.

**CS 151 Forage Production 3.**
Characteristics of major forage crops and their response to agronomic and animal management factors. Utilization methods, growth and quality characteristics related to animal performance. GREEN.

**CS 152 Weed Control in Field Crops 3.**
Principles involved in development of weed control programs and practical application of weed management techniques for major North Carolina cropping systems. Emphasis on proper use of herbicides. Laboratory includes weed identification and herbicide application methods. JORDAN.

**CS 153 Turfgrass and Ornamental Weed Control 3.**
General principles in development of turfgrass and ornamental weed prevention and management programs. Different weeds and their life cycles and management techniques and factors affecting herbicide performance. Laboratory includes weed identification and herbicide application methods. YELVERTON.

**CS 154 Turf Weed and Disease Management 3.**
General principles in turfgrass weed and disease development and management programs. Different weeds, their life cycles, management techniques, and factors affecting herbicide application performance will be covered. Students will learn the causes, development, identification and management of turfgrass diseases. Laboratory includes weed identification and herbicide application methods. Certain laboratory exercises will require personal transportation to Lake Wheeler Road Turf Field Lab unless otherwise specified by the lab instructors. The course is restricted to AGI students only.

**CS 155 Advanced Turf Management 3.**
Turfgrass management covering mineral nutrition, water relations, environmental stress responses and management regimes for low maintenance turf, golf courses, athletic fields and other turf settings. PEACOCK.

**CS 162 Flue-Cured Tobacco Production 1.**
Flue-cured tobacco production, with emphasis on crop management practices, variety selection, transplant production, integrated pest management, fertilization, harvesting and curing, competitiveness in the world market, product needs of the tobacco manufacturing industry, and the role of climate and soil on yield and quality. FISHER.

**CS 163 Peanut Production 1.**
Principles of modern peanut production. Emphasis on the history and dispersal of peanuts, supply management programs, physiology of peanut growth and development, weed, disease, and insect management, fertility practices, recommended cultural practices including IPM, methods of maturity determination, recommended harvesting, curing, and handling practices. JORDAN.

**CS 164 Soybean Production 1.**
Introduction to the production of soybeans in North Carolina and the southeastern United States. Growth and development, tillage, fertility, varieties, seed quality, planting decision, pest management, harvesting, production economics, marketing, environmental quality, and social responsibility. DUNPHY.

**CS 165 Cotton Production 1.**
Cotton production, marketing, and improvement. Emphasis on current information regarding varieties, fertilization, disease, insect and weed control, cultural practices, equipment, harvesting and marketing. EDMISTEN.

**CS 166 Corn Production 1.**
Growth, management, and markets for corn in North Carolina.

**CS 167 Wheat Production 1.**
Practical approach to growing wheat and other small grain crops. Topics will include growth, management, and markets for small grains in North Carolina.
CS 190 Turf Seminar 1.
Discussions of the operations, opportunities, and problems existing in various phases of the turf industry by leaders in the various facets of the industry.

CS 191 Field Crops Seminar 2.
Guest speakers, student presentations, and outside assignments will address professionalism; professional development; and current challenges, issues, and opportunities facing profitable and sustainable agronomic crop production. A grade of C or better is required. FCT Only.

CS 200 Introduction to Turfgrass Management 4.
Prerequisite: BIO 181(preferred) or ZO 160(alternate) BO 200, or CS 213. Turfgrass selection, establishment, maintenance, and pest management in lawns, golf courses, athletic fields, and roadside care; Emphasis on understanding the impact of the environment on management practices and turfgrass performance. Field trips in laboratory.

CS 210 Lawns and Sports Turf 3.
Utilization of turfgrasses for lawns and recreational areas. Emphasis on: the cultural and environmental benefits of grassed areas, concepts of grass growth and development, selecting adapted grasses for proper use, techniques for successful establishment and management of cool- and warm-season turfgrasses, fertilization, irrigation, aeration, and pest management. The history and benefit of natural and artificial sports fields will also be discussed. Credit will not be awarded for both CS 200 and CS 210.

CS 211 Plant Genetics 3.
Prerequisite: BIO 183 or ZO 160. Fundamentals of plant genetics. Genetic basis for plant improvement. Genetic analysis of Mendelian traits, molecular structure and organization of genetic material, crop biotechnology, distribution and behavior of genes in populations.

CS 213 Crops: Adaptation & Production 4.
Prerequisite: BIO 181(preferred) or ZO 160(alternate) or BO 200. Fundamental structure and reproductive features of crops. Their adaptation and importance in global agriculture. Practices and inputs needed for economic production of a quality product and interaction of these factors within the constraints of climate, soils, and topography in maintaining a quality environment.

CS 214 Crop Science Laboratory 1.
Prerequisite: BIO 181 or BIO 183 or PB 200 or PB 250; Co-requisite: CS 213.
The laboratory's intent is to provide students enrolled in the CS 213 lecture course opportunity to apply under field and controlled environmental conditions the crop production principles introduced in the lecture course. Using a hands-on approach targeting a variety of crop management approaches, students will examine the growth and development characteristics that relate most directly to final yield and quality of the marketed product. Students will employ a spectrum of treatment combinations aimed at strengthening understanding of the interaction of genotype, environment, and management, with the goal of identifying influential factors of crop yield and quality.

CS 216 Oleseed Crop Production 3.
Fundamental agronomic practices associated with the production of oleseed crops (soybean, peanuts and cotton). Discussions will include crop growth and development stages, variety characteristics, planting strategies, fertility and pest management programs, harvest and storage options, and the use of technologies associated with the production and maintenance of quality oleseed crops.

CS 218 Cereal Grain Crop Production 2.
Fundamental agronomic practices associated with the production of cereal grain crops (corn and small grains). Discussions will include crop growth and development stages, how to choose the best varities and hybrids, planting strategies, fertility and pest management programs, harvest and t=storage options, and the use of technologies associated with the production and maintenance of quality grain.

CS 224 Seeds, Biotechnology and Societies 3.
An exploration of seeds, how seeds are the delivery system for crop biotechnology and how a specific culture’s perception of science and agriculture influence the acceptance or rejections of modern genetic technologies. Topics include seed germination, survival and preservation; seed industry influence on societies and how societies are influencing the seed industry; seed production - commercially and at home; how our diverse genetic resources are preserved; how biotechnology is applied to agriculture and delivered through seeds; the impact biotech is having on the seed industry and subsequently on us and global agriculture; concerns and potential benefits of biotechnology application to crops.

CS 230 Introduction to Agroecology 3.
Prerequisite: BIO 105 or BIO 181 or BIO/ZO 160 or BO 200 or BO 250 or HS 201 or CS 213.
This course will examine the biological and physical attributes of farming systems and their associated ecological and social impacts in temperate and tropical regions. It will address the ecological consequences of indigenous food and fiber production systems, conventional agricultural systems and “alternative” systems that incorporate biological pest control and natural nutrient inputs. Students will examine several case studies that integrate their understanding of concepts.

CS 290 Professional Development in Plant & Soil Sciences 1.
This course is designed to prepare students for careers in Plant and Soil Sciences. Student discussions with faculty and industry professionals will center on structure and requirements for internship and jobs, research and extension opportunities, resume building and writing, professionalism and professional development, interpersonal skills, undergraduate program management, and career planning. Student development of an e-portfolio is required. Must hold sophomore or junior standing in: TAA, TAB, TAC, TSS, TFG.

CS 312 Grassland Management for Natural Resources Conservation 3.
Prerequisite: BIO 181(preferred) or ZO 160(alternate) CS 213, SSC 200. Basic principles and practices of production and utilization of pasture and forage crops; impact on developing sustainable systems for livestock feed, soil and water conservation; use of computers to assist in whole farm planning and information retrieval.

CS 400 Turf Cultural Systems 3.
Prerequisite: C- or better in CS 200.
Topics include: golf course design considerations, fertilizer characteristics and application techniques, irrigation programming, construction of high use turfgrass areas, calibration of spreaders and sprayers, aeration, pesticide fate and development of effective management systems.

CS 411 Crop Ecology 3.
Prerequisite: PB 321 or PB 421.
CS 413 Plant Breeding 2.
Prerequisite: GN 411 or ANS 215.
Discussion of reproductive systems of higher plants; the genetic basis for plant improvement and the selection, evaluation, and utilization of crop varieties.

CS 414 Weed Science 4.
Prerequisite: CH 220.
History, current status and fundamentals of weed biology and cultural, biological, and chemical weed control; properties and uses of herbicides; weed identification; proper use of herbicide application equipment; current weed management practices in crops and non-cropland situations.

CS 415 Integrated Pest Management 3.
Prerequisite: BIO 181(preferred) or ZO 160(alternate) or BO 200 or BO 250.
History, principles, and application of techniques for managing plant pests. Theory and practice of integrating pest control tactics to manage pests within economic, environmental, and sociological constraints. Topics include pest monitoring methodology, economic aesthetic thresholds, biological control, efficient pesticide use, biotechnology, and global positioning systems.

CS 424 Seed Physiology 3.
Prerequisite: PB 321 or PB 421 or FOR 303.
This course will explore the physiological processes associated with seed formation, development, maturation, germination, and deterioration of agronomic and horticultural species. We will also study the physiological aspects of seed dormancy, how dormancy is manifested and overcome in cultivated and noncultivated systems and dormancy’s impact on weed seedbank ecology.

CS 430 Advanced Agroecology 4.
P: CS 230.
This course applies agroecological principles introduced in CS 230 and critical thinking to evaluate various agroecosystems. Students will examine food, fiber, and other commodity production systems for security, productivity, and sustainability and address the simultaneous need to protect natural environments and the biodiversity on which agroecosystems depend. Topics include discussion of national and international government policies, research programs, and education programs that influence the future application of agroecosystem principles.

CS 462 Soil-Crop Management Systems 3.
Prerequisite: CS 213, CS 414, SSC 342, SSC 452, Senior standing.
Unites principles of soil science and crop science with those of allied areas into realistic agronomic applications; practical studies in planning and evaluation of soil and crop management systems.

CS 465 Turf Management Systems and Environmental Quality 3.
Prerequisite: CS 400 and Senior standing.
Integration of turfgrass management systems and the use of BMPs and IPM to protect environmental quality. Examination of water quality issues relative to turf. Application of Best Management Practice and Integrated Pest Management strategies. Credit cannot be received for both CS 465 and CS 565. Senior standing.

CS 470 Advanced Turfgrass Pest Management 2.
Prerequisite: C- or better in CS 200.
Characteristics and ecology of turfgrass weed, insect, and disease pests; identification and diagnosis of turfgrass pests, strategies for managing pests including cultural, mechanical, biological, and chemical methods; development of integrated pestmanagement programs, characteristics and modes of action for herbicides, insecticides, fungicides, and plant growth regulators; behavior and fate of pesticides in soil; and the development and management of pesticide resistant pest populations.

CS 490 Senior Seminar in Crop Science and Soil Science 1.
Prerequisite: Senior standing in Agronomy, Plant and Soil Sciences, or Turfgrass Science.
Review and discussion of current topics in crop science, soil science, agronomy and natural resource management. Preparation and presentation of scientific information in written and oral format. Senior standing in Agronomy, Plant and Soil Sciences, or Turfgrass Science.

CS 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

CS 493 Special Problems in Crop Science 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer the departmental teaching coordinator and the academic dean prior to the experience.

CS 495 Special Topics in Crop Science 1-6.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

CS 502 Plant Disease: Methods & Diagnosis 2.
Prerequisite: PP 315.
Introduction to the basic principles of disease causality in plants and the methodology for the study and diagnosis of plant diseases caused by fungi. Identification of plant-pathogenic fungi. Research project, disease profiles and field trips are required.

CS 524 Seed Physiology 3.
Prerequisite: (CH 220 or CH 221 or CH 225) and (PB 321 or PB 421 or FOR 303).
This course will explore the physiological processes associated with seed formation, development, maturation, germination, and deterioration of agronomic and horticultural species. We will also study the physiological aspects of seed dormancy, how dormancy is manifested and overcome in cultivated and noncultivated systems and dormancy’s impact on weed seedbank ecology.

CS 541 Plant Breeding Methods 3.
Prerequisite: ST 511, Corequisite: ST 512.
Overview of plant breeding methods for advanced undergraduate and beginning graduate students. Covers principles and concepts of inheritance, germplasm resources, pollen control, measurement of genetic variances, and heterosis. Special topics include heritability, genotype-environment interaction, disease resistance, and polyploidy. In-depth coverage on methods for breeding cross-pollinated and self-pollinated crops. Prepares students for advanced plant breeding courses.
CS 565 Turf Management Systems and Environmental Quality 3. Prerequisite: CS 400.
Integration of turfgrass management systems and the use of BMPs and IPM to protect environmental quality. Examination of water quality issues relative to turf. Application of Best Management Practice and Integrated Pest Management strategies. Credit cannot be received for both CS 465 and CS 565.

CS 590 Special Topics 1-6.

CS 591 Special Problems 1-6.
Special problems in various phases of crop science. Problems may be selected or will be assigned. Emphasis on review of recent and current research. Credits Arranged.

CS 601 Seminar 1.
Prerequisite: Graduate standing.
Review and discussion of scientific articles, progress reports in research and special problems of interest to agronomists. Maximum of two credits allowed toward master's degree; however, additional credits toward doctorate allowed.

CS 620 Special Problems 1-6.
Special problems in various phases of crop science. Problems may be selected or will be assigned. Emphasis on review of recent and current research. Credits Arranged.

CS 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

CS 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

CS 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

CS 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

CS 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

CS 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

CS 714 Crop Physiology: Plant Response to Environment 3.
Prerequisite: (PB 321 or PB 421) and CH 223 or CH 227.
Examines interactions between plants and the environment. Light environment, plant canopy development, photosynthesis, source-sink relations, growth analysis, growth regulation, water relations, and environmental stresses are addressed.

CS 717 Weed Management Systems 1.
Prerequisite: CS 414.
Weed management systems including integration of cultural, biological, mechanical and chemical methods for vegetables, fruits, ornamentals, turf, small grains, corn, tobacco, cotton, peanuts, aquatic and non-cropland settings. Taught second 5 weeksof semester. Drop date is by last day of 3rd week of minicourse.

CS 720 Molecular Biology In Plant Breeding 3.
Prerequisite: CS(GN,HS) 741, GN 701, GN 702, GN 703.
Theory and principles of molecular biology applied to plant breeding. Experimental approaches to induce genetic change, cytoplasmic recombination, haploid utilization and potentials of molecular techniques for solving breeding problems.

CS 725 Pesticide Chemistry 1.
Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225).
Chemical properties of pesticides including hydration and solvation, ionization, volatilization, lipophilicity, molecular structure and size, and reactivity and classification according to chemical description, mode of action or ionizability. Taught during the first 5 weeks of semester. Drop date is last day of 3rd week of the minicourse.

CS 726 Advanced Topics In Quantitative Genetics and Breeding 3.
Prerequisite: ST 511, Corequisite: ST 512.
Advanced topics in quantitative genetics pertinent to population improvement for quantitative and categorical traits with special applications to plant and animal breeding. DNA markers - phenotype associations. The theory and application of linear mixed models, BLUP and genomic selection using maximum likelihood and Bayesian approaches. Pedigree and construction of genomic relationships matrices from DNA markers and application in breeding.

CS 727 Pesticide Behavior and Fate in the Environment 2.
Prerequisite: CS(HS,SSC,T0X) 725, SSC 200.
Sorption/desorption, soil reactivity, movement, volatilization, bioavailability, degradation and stability of pesticides in the environment. Taught during the last 10 weeks of semester. Drop date is last day of 3rd week of the minicourse.

CS 729 Herbicide Behavior In Plants 2.
Prerequisite: BO 751 and BO 752 and CS(HS,SSC) 725.
Chemical, physiological and biochemical actions of herbicides in plants including uptake, translocation, metabolism and mechanism of action.
CS 745 Quantitative Genetics In Plant Breeding. 3.
Prerequisite: CS(GN, HS) 541, ST 712, course in quantitative genetics recommended.
Theory and principles of plant quantitative genetics. Experimental approaches of relationships between type and source of genetic variability, concepts of inbreeding, estimations of genetic variance and selection theory.

CS 746 Breeding Methods. 2.
Prerequisite: CS(GN, HS) 741, ST 535.
Theory and principles of plant breeding methodology including population improvement, selection procedures, genotypic evaluation, cultivar development and breeding strategies.

CS 755 Applied Research Methods and Analysis for Plant Sciences. 3.
Prerequisite: ST 511.
Students will gain understanding of the common principles of scientific method. They will gain knowledge and experience with planning for research, developing research objectives, methodology considerations, experimental design, statistical analyses, and presentation of data. Class will have a heavy focus on experimental methods in applied plant science research.

CS 795 Special Topics. 1-6.

CS 801 Seminar. 1.
Prerequisite: Graduate standing.
Review and discussion of scientific articles, progress reports in research and special problems of interest to agronomists. Maximum of two credits allowed toward master's degree; however, additional credits toward doctorate allowed.

CS 820 Special Problems. 1-6.
Special problems in various phases of crop science. Problems may be selected or will be assigned. Emphasis on review of recent and current research. Credits Arranged.

CS 860 Plant Breeding Laboratory. 1.
Prerequisite: CS(GN, HS) 741.
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

CS 861 Plant Breeding Laboratory. 1.
Prerequisite: CS(GN, HS) 741.
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

CS 885 Doctoral Supervised Teaching. 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

CS 890 Doctoral Preliminary Examination. 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

CS 896 Summer Dissertation Research. 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Curriculum and Instruction (ECI)

ECI - Curriculum and Instruction Courses

ECI 201 Intro to Instructional Technology for Educators. 3.
Introduction to effective technology integration in teaching practices across the curriculum for pre-service teachers. Exploration of different technology-based tools commonly integrated in instruction, including desktop, Internet/ Web-based, mobile, and cloud applications. Examination of integration challenges using relevant, real-world examples from current teacher practices. Planning for student-centered, project-based lessons that make use of diverse technologies.

ECI 204 Intro to Teaching. 1-2.
Prerequisite: Sophomore standing; Corequisite: ED 204.
For prospective teachers in Middle and Secondary Business and Marketing, English, Foreign Languages, Language Arts, and Social Studies. Emphasis on what it means to be an educator as well as differing aspects and procedures of instruction and analysis of competencies required of teachers. The course has a required fieldwork component in local K-12 school, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

ECI 205 Introduction to Teaching Humanities and social Sciences. 3.
Prerequisite: Sophomore standing.
For prospective teachers in secondary and middle years social studies, English, language arts, and foreign languages. An emphasis on differing aspects and procedures of instruction and analysis of competencies required of teachers. Field work in a variety of education settings including an extended period in one curriculum area.

ECI 296 Special Topics in Education. 1-3.
Individual or group study of particular areas of education at the freshman and sophomore levels. Specific topics will vary from semester to semester.

ECI 305 Principles of Teaching Diverse Populations. 3.
Prerequisite: ED 204.
Impact of cultural factors on experiences of teachers and students in contemporary schools. Teaching techniques and development of instructional plans to enhance schooling experiences of culturally diverse students.
ECI 306 Middle Years Reading 3.
Prerequisite: Six hours in ED or PSY.
Reading skills in middle years education developed with emphasis on application of the reading process to content area.

ECI 307 Teaching Writing Across the Curriculum 3.
Prerequisite: ENG 101.
For prospective teachers of all disciplines in middle/high school. Practical strategies for writing as a learning tool and for teaching writing. Lesson plans, assignments, experiences appropriate to content areas. Focus on writing, writing instruction, and technology. Separate sections for Middle Grades (MSL) and English (LTN) majors.

ECI 309 Teaching in the Middle Years 3.
Prerequisite: Six hours in ED or PSY.
Nature and purposes of middle grades education. Early adolescent development, curriculum, teaching/learning methods, school organization, and characteristics of effective middle years teachers. Includes field experience.

ECI 332 Health Promotion and Disease Prevention 3.
Prerequisite: For credentialed health professionals only.
Emphasis on education of the public regarding general health concerns including cancer, cardiovascular disease, accident prevention, nutrition, drugs, alcohol, mental health, sexuality, and environmental hazards.

ECI 333 Health Care Delivery 3.
The historical basis of health care delivery in the U. S. with emphasis on hospitals, health maintenance organizations, ambulatory care centers, ambulatory surgery, nursing homes, and private care practice. Philosophical issues of funding health care, promoting health care, and the training of health care workers.

ECI 335 Planning Classroom and Clinical Curricula 3.
Prerequisite: For Certification Majors: EOE 101, 205; For Non-Certification Majors: EOE 101. For credentialed health professionals. Procedures for planning health occupations curricula for classroom and clinical settings. Practice in writing, updating, and refining health curriculum with emphasis on selection and sequencing. Comparison of styles of writing curricula. Roles and responsibilities of healthy curriculum planner.

ECI 336 Strategies for Teaching a Health Occupations Course 3.
Prerequisite: For credentialed health professionals.
Planning and implementation of effective instructional strategies for clinical and classroom settings. The nature of the teaching/learning process, psychological and philosophical aspects of teacher choice of various strategies.

ECI 405 Literature for Adolescents 3.
Prerequisite: Junior standing.
The history, types, and characteristics of literature for adolescents. Emphasizes reading and analyzing the literature by exploring the themes, literary elements, and rationale for teaching literature for adolescents. Addresses ways in which this literature can be integrated and implemented in English/Language Arts curriculum.

ECI 414 Human Relations and Discipline in the Classroom 3.
Prerequisite: PSY 304 or EDP 304 and 6 hours of education.
Designed to help prospective teachers foster positive interpersonal relationships in classrooms, build a sense of community and create a purposive environment for learning. Investigates issues such as group building, active listening, and major approaches to discipline. Uses case studies and problem solving methods.

ECI 416 Teaching Exceptional Students in the Mainstreamed Classroom 3.
Prerequisite: Six hours in ED or PSY.
Providers classroom teachers in all disciplines and grade levels with a knowledge of various handicapping conditions, as well as with techniques to assist exceptional students within the mainstreamed classroom. Required for MSL majors.

ECI 423 Methods and Materials in Teaching Modern Foreign Languages 4.
Prerequisite: Admission to Professional Semester, Corequisite: ECI 424.
Methods and materials of teaching French or Spanish grades K-12 with an emphasis on lesson and unit planning, second language acquisition, national standards, and demonstrations/practice teaching in micro-lessons. This course provides opportunities for prospective French and Spanish teachers to integrate knowledge of their language with effective materials, strategies, and methods of instruction to prepare students for K-12 French or Spanish teaching. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools.

ECI 424 Student Teaching in French or Spanish 12.
Prerequisite: Admission to Professional semester, Corequisite: ECI 423.
Teaching experience for prospective teachers of French or Spanish in a selected elementary, middle or high school under the supervision of a cooperating teacher and a university faculty supervisor. Additional school observations and on campus seminars are a part of this course. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are covered under the General Statute affording liability protection.

ECI 430 Methods and Materials for Teaching Language Arts in the Middle Grades 4.
Prerequisite: ECI 205, ELP 344, PSY 304 or EDP 304, ECI 309, ECI 306, ECI 307, Senior standing, candidacy in Middle Grades Teacher Education, Corequisite: ECI 435.
Inquiry, activity-oriented course provides opportunities for prospective language arts middle school teachers to integrate knowledge of English with effective materials, strategies, methods of instruction. Students observe middle school classes, plan lessons, and units, practice varied classroom strategies, technologies in micro-lessons. Prepared students for teaching language arts with other content areas in middle schools.

ECI 435 Methods and Materials for Teaching Social Studies in the Middle Grades 4.
Prerequisite: Admission to Professional semester.
For preservice middle school social studies teachers. Focus on: teaching and evaluation skills, adaptation of instruction to individual learner differences, identification and creation of instructional materials appropriate for use in social studies teaching.

ECI 438 Medical Law and Ethics 3.
Ethical and legal issues involved in delivering health care, such as euthanasia, reproductive technology, organ transplants, patients' rights, and confidentiality. Classical ethical theories and principles. Systematic review procedures and current medical law used to examine current case dilemmas in the health professions.
ECI 442 Field Experience in Business and Marketing Education 3.
Prerequisite: Junior standing.
Supervised off-campus work experience in an approved business and marketing content related job. The work experience relates on-the-job experiences to the technical competencies taught in the North Carolina Standard Course of Study for business and marketing education. Students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

ECI 444 Administration of Business and Marketing Education 3.
Prerequisite: ED 204 and ECI 204 and MKE Business and Marketing Education Major.
Development of successful business and information technology, and marketing education programs. Program promotion, managing cooperative education experiences, managing DECA and FBLA chapters, and determining professional development strategies. Primary roles of the business and information technology and marketing education teachers' classroom instruction. Program management, classroom management, management of career-technical student organizations, cooperative education, and program development.

Prerequisite: Senior Standing; Corequisite: ECI 430 and ECI 435.
Inquiry, activity-oriented course designed to engage students in theory and practice related to 21st century skills, new literacies, and emerging technologies, as well as focused support for developing the culminating electronic portfolio. Course provides opportunity for pre-service, English Language Arts/ Social Studies middle School teachers to integrate knowledge of English and Social Studies with emerging technologies and digital literacy applications.

ECI 446 Curriculum and Methods of Teaching Business and Marketing Education 4.
Prerequisite: Admission to Teacher Education Candidacy ; MKE Business and Marketing Education Majors.
Study of the curriculum common to business and information technology and marketing education and the research behind its development. Methods common to instructional planning, implementation, and evaluation of effective business and information technology and marketing education programs are topics included in this course. Twenty hours of field work are required. Students are expected to provide their own transportation to and from assigned public schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details in acquiring the insurance and the current charge. MKE students only.

ECI 447 Student Teaching in Business and Marketing Education 9.
Prerequisite: Admission to Professional Semester ; MKE Business and Marketing Education Majors, Corequisite: ECI 494.
Fifteen weeks full-time student teaching business and marketing subjects in the public schools under the supervision of a cooperating teacher and university supervisor. Students will develop skills in instruction, evaluation, advisement, administration, and observation. Students are expected to provide their own transportation to and from assigned public schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. MKE students only.

ECI 448 E-Business Applications in Business and Marketing Education 3.
Prerequisite: Junior standing.
Emphasis on design and construction of advanced web pages, business and marketing applications of electronic commerce, as well as economic, social, legal, and ethical issues that are related to conducting business in a virtual environment. Content prepares students to apply principles to the business and marketing education curriculum in the public schools. Credit for both ECI 448 and ECI 548 is not allowed.

ECI 450 Methods and Materials in Teaching English 4.
Prerequisite: ECI 204, ELP 344, PSY 304 or EDP 304; Senior standing and admission to Teacher Education candidacy with a Major in English.
Methods and materials of teaching English in grades 9-12, with an emphasis on lesson planning and demonstrations/practice in teaching literature, study skills, speaking, listening, and writing. Taught during the first seven weeks of the semester.

ECI 451 Teaching Reading Across Disciplines 3.
Prerequisite: Six hours in ED or PSY.
Facilitates study of methods and materials for teaching literacy across disciplines. Develops instructional strategies in the use of print and digital texts and media to support disciplinary learning.

ECI 454 Student Teaching in English/Language Arts 1-12.
Prerequisite: Admission to Student Teaching Professional Semester ; For MSL students: ECI 430, 416, 464.
Provides the prospective teacher with experience in the techniques and skills involved in teaching English in secondary schools or Language Arts in middle schools in a selected off-campus station. Student interns become familiar with the total school program, eventually carrying a full teaching load, and participate in relevant school and community activities. Students are required to provide their own transportation. TED and MSL majors only.

Prerequisite: ECI 205, ELP 344, Sr. standing and admission to professional semester with a major in either history, sociology, political science.
Teaching techniques, innovations, and development of teaching and evaluation skills in the area of secondary school social studies. Adaptation of instruction to individual learner differences, and selection and design of instructional materials. Taught during the first six weeks of the semester. Taught during the first six weeks of the semester.

ECI 464 Student Teaching in Social Studies 1-8.
Prerequisite: Admission to professional semester, Corequisite: For LTH, LTP, LTS students: ECI 460. For MSL students: ECI 454, 430, 416.
Skills and techniques in teaching social studies in secondary and middle schools. Each student spends ten weeks in a selected off-campus center. The student demonstrates competencies essential for teaching social studies, becomes familiar with the total school program, and participates in a variety of school and community activities.

ECI 471 Educational Implications of Learning and Developmental Theory 3.
Prerequisite: NC TEACH Participants.
Topics related to human psychological development. Cognitive, social, physical changes, and their interaction among adolescence. Departmental Approval Required.
ECI 472 Interaction of Classroom Management and Instruction 3.
Prerequisite: ECI 471; NC TEACH Participants.
Topics related to teaching in the content area and classroom management. Lesson planning, principles applied to education, measurement and evaluation procedures, behavior therapy, and student motivation. Departmental Approval Required.

ECI 473 Subject Specific Methods 3.
Prerequisite: ECI 472; NC TEACH Participants, Corequisite: ECI 474.
Topics related to cultural factors and how they affect teachers and students in the classroom. Instructional techniques and the development of instructional plans that enhance schooling experiences of culturally diverse students. Departmental Approval Required.

ECI 474 Curriculum and Instruction Practices 1 3.
Prerequisite: ECI 472; NC TEACH participants, Corequisite: ECI 473.
Topics related to essential skills and concepts needed by beginning teachers. The class focuses on questioning, test preparation, discussion skills, familiarity with national standards, multiple teaching strategies, and assessment + evaluation of students. Departmental Approval Required.

ECI 475 Peer Mentoring in Alternative Licensure 3.
Prerequisite: ECI 474; NC TEACH Participants, Corequisite: ECI 476.
Topics related to observing and evaluating fellow teachers in relation to the national state teaching competencies. Classroom observations, videotaping, and group evaluations that are shared and discussed with fellow teachers. Departmental Approval Required.

ECI 476 Curriculum and Instruction Practices 2 3.
Prerequisite: ECE 474; NC TEACH Participants, Corequisite: ECI 475.
Topics related to inquiry, activity based instruction, and constructivist principles. Analysis of principles, strategies and application of new teaching approaches. Departmental Approval Required.

ECI 494 Senior Seminar in Business and Marketing Education 3.
Prerequisite: Admission to Professional Semester; MKE Business and Marketing Education Majors, Corequisite: ECI 447.
Discussion and analysis of problems, trends, and issues experienced while student teaching in the public schools.

ECI 496 Special Topics in Education 1-3.
Prerequisite: Junior standing or Senior standing.
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

ECI 500 Theory and Practice In Teaching Diverse Populations 3.
Prerequisite: Graduate standing.
Analysis of literature and research in related to impact of cultural factors on teaching and learning in contemporary schools. Exploration of teaching techniques and curricular directions designed to improve school experiences for diverse populations in K-12 settings.

Prerequisite: 12 sem. hrs. graduate ED and PSY.
Origin, development, and current status of elementary and secondary school curriculum and an evaluation of trends and issues likely to influence the curriculum in the future.

ECI 502 Continuous Improvement of School Technology Initiatives 3.
Introduction to the models, strategies, and tools for evaluating and making informed decisions about technology initiatives; examination of technology evaluation case studies, evaluation proposals, and stakeholder reports.

ECI 505 Issues and Trends in Foreign Language Education: Theory & Practice 3.
Prerequisite: Graduate standing.
An exploration of theory and practice issues related to foreign language teaching. Inquiry into proficiency-oriented instruction, innovative methodological approaches, the National Standards and learning scenarios, integrating culture, options for testing and assessment, content-based instruction, the role of grammar in second language acquisition, teaching foreign language students with learning disabilities, and Foreign Language in the Elementary School (FLES) in North Carolina. Students will examine case studies related to these topics and engage in a classroom action research project.

ECI 506 Instructional Technology in Foreign Language Education: Addressing the National 3.
Prerequisite: Graduate standing.
Hands-on experience in appropriately selecting and applying a number of instructional technologies to foreign language teaching and learning in relation to the current National Standards. Analysis and use of effective technology tools including hardware, software, and courseware. Emphasis will be on the application of Technology-Enhanced Language Learning (TELL) as it integrates the National Standards’ goals of Communication, Cultures, Connections, Comparisons, and Communities.

ECI 507 Social Justice Education 3.
Prerequisite: ECI 500.
Introduction to principles of social justice education and their centrality in progressive policies and pedagogies that lead to equity in all teaching contexts. Students will develop strategies for successfully incorporating a social justice education framework in scholarship and professional practice.

ECI 508 Teachers as Leaders 3.
Prerequisite: Graduate standing.
Examines teacher leadership research, theory, and practice. Prepares teachers to assume leadership roles in classrooms, schools, school systems, and the larger educational community. Independent research projects required.

ECI 509 Special Problems in Curriculum and Instruction 1-6.
Prerequisite: Six hours of ED or PSY.
In-depth study of topical problems in curriculum and instruction selected from areas of current concern to practitioners in education.

ECI 510 Research Applications In Curriculum and Instruction 3.
Prerequisite: ST 507, Doctoral student; C and I Major.
Focus on current issues and research methods used in the areas of curriculum development and supervision, instructional technology, English education, middle grades education, reading education, social studies education and special education.

ECI 511 Technology Integration Theory and Practice 3.
Prerequisite: Graduate standing.
Foundational study of technology integration standards, models, and conditions informed by research. Analysis of micro classroom and macro school/institutional technology plans, and development of sample technology plans and projects representative of integration across curricular areas.

ECI 512 Emerging Technologies for Teaching and Learning 3.
Examination of emerging technologies as applied in educational settings with a focus on related research, case studies, theoretical underpinnings, and strategies for effective integration.
ECI 513 Teaching and Learning with Digital Video 3.
Prerequisite: Graduate standing.
Development and implementation of digital video within educational contexts and situations. Design of educational watching, analyzing, and creating activities with video. Application of conventions and genres of digital video capture and editing to sample technology projects across curricular areas.

ECI 514 Multimedia Design and Applications in Instruction 3.
Prerequisite: Graduate standing.
Examination of learning theories and research-based principles for multimedia design to select/apply appropriate digital resources and create maximally effective educational products.

ECI 515 Online Collaborations in Education 3.
Examination of models of collaboration, sample online collaborative strategies and projects, tools supportive of cross-classroom collaborations, and research findings from collaborative initiatives.

ECI 516 Design and Evaluation Of Instructional Materials 3.
Prerequisite: Graduate standing.
Characteristics and selection of various media for instruction and their use in educational settings. Design and production of instructional materials. Analysis of research in the field. Individualized projects and assignments. Application of grounded research and theory concerning learning to design of instructional materials. Structured projects and practical experiences used to transfer design principles and evaluate instructional products.

ECI 517 Theoretical Foundations of Advanced Learning Environments 3.
Examination and application of behavioral, cognitive, and constructivist theoretical frameworks underlying the design and development of advanced technology-enhanced learning environments.

ECI 518 Digital Learning Program and Staff Development 3.
Prerequisite: ECI 511, ECI 514, ECI 515, ECI 642.
Study and application of principles related to digital learning program planning, facilities and resource management, and staff development in K-12 settings.

ECI 519 Special Problems in Digital Learning and Teaching 1-6.
Prerequisite: Six hours of ED or PSY.
In-depth study of topical problems in digital learning and teaching selected from areas of current concern to practitioners in education.

ECI 520 The Teaching Of Composition 3.
Prerequisite: 9 hrs. of ED, PSY and/or ENG.
For classroom teachers. Practical field-tested ideas to help students improve as writers by focusing on composition as a process as well as a product. Activities for teaching prewriting, drafting, revising, proofreading, grammar and evaluating with suggestions for individual and group learning. Writing in content areas and composition research/ theory. To take this course in sum. as part of Capital Area Writing Project, student must apply and be selected.

ECI 521 Teaching Literature For Young Adults 3.
Prerequisite: Senior standing or Graduate standing or PBS status.
Designed to acquaint in-service and pre-service teachers with breadth and diversity of contemporary literature for adolescents, with emphasis on teaching young adult literature. Addresses history and themes of young adult literature, readability of materials, reading preferences, literary merit, skills that can be taught through literature, censorship, motivating students to read and organizing literature units.

ECI 522 Trends and Issues in English Language Arts Education 3.
Prerequisite: Graduate standing.
Consideration of past, current, and future trends and issues in English Language arts instruction, standards, and methodologies. Examination of research, theory, and practice in concert with trends, issues, and questions. Independent research projects required.

ECI 523 Teacher as Researcher 3.
Prerequisite: Graduate standing.
This course is designed to introduce the methods and skills required for designing, conducting, interpreting, and applying action research - the systematic inquiry into curriculum, instruction, teaching, and learning. This course will focus on reflective inquiry and practical applications.

ECI 524 Theory and Research in Global Learning 3.
An examination of theoretical frameworks for global learning and comparative studies of various national approaches to K-12 education. This course provides students with multiple lenses through which to consider how we teach and learn given the demands and opportunities present in our interconnected world.

ECI 525 Contemporary Approaches In the Teaching Of Social Studies 3.
Prerequisite: Advanced Undergraduate standing or Graduate standing.
Analysis of principles, strategies and application of new teaching approaches. Structured projects and practical experiences.

ECI 526 Theory and Research On Teaching and Learning Social Studies 3.
Prerequisite: ECI 530 or ECI 525.
A critical analysis of the literature relating to the teaching and learning of social studies and the drawing of implications for instructional practices.

ECI 528 Strategies for Teaching English in Secondary Schools 3.
Methods and materials of teaching English in grades 9-12, with and emphasis on lesson planning and demonstrations/practice in teaching literature, study skills, speaking, listening, media literacy, and writing. Some classes and assignments will be completed in a field setting.

ECI 530 Social Studies In the Elementary School 3.
Prerequisite: Six hrs. in ECI.
Advanced professional training in teaching of social studies for middle grades and elementary teachers, including in-depth introduction to research-based teaching strategies, instructional resources and literature of the field.

ECI 531 Advanced Writing in Education 3.
Appropriate for any specialty area in Education. Focus on writing required in graduate courses, research reviews for educational reports and National Board Certification, writing for educational journals, theses, and dissertations. Opportunities to gain knowledge, tools, and strategies to meet the academic community’s standards. Strategies to develop and/or enhance form, style, content, quality of academic writing, and on researching, composing, revising, and editing. Students will compose, self-evaluate and give feedback on the work of their peers. Graduate status.

ECI 535 Methods and Materials for Teaching Social Studies in the Middle Grades 3.
For preservice middle school social studies teachers. Focus on: teaching and evaluation skills, adaptation of instruction to individual learner differences, identification and creation of instructional materials appropriate for use in social studies teaching. Cannot earn credit for ECI 435 and ECI 535.
ECI 537 Teaching Children’s Literature 3.
Instructions for educators in quality children’s literature, specific needs of young reader, genres of children’s literature, strategies for instructing children’s literature, ways to target reader’s interests, and design of literature units.

ECI 540 Reading In the Elementary School 3.
Prerequisite: Six hrs. ED or PSY.
Theoretical foundations of reading instruction and current methods and materials for teaching reading, with emphasis on planning and implementing reading programs for children in kindergarten through grade six.

ECI 541 Reading In the Content Areas 3.
Prerequisite: Six hours in ED or PSY.
Methods in instruction for applying reading to content areas, with emphasis on means of improving comprehension, vocabulary and learning strategies in subject matter classrooms.

ECI 543 Diagnosis Of Reading Disabilities 3.
Prerequisite: ECI 540 or ECI 541.
Formal and informal instruments for diagnosing reading disabilities including completion of a diagnostic case study describing reading performance of a disabled reader.

ECI 544 Remediation Of Reading Disabilities 3.
Prerequisite: ECI 543.
Advanced approaches to reading remediation including theory and research related to remedial instructional strategies, analyses of instructional designs and evaluations of effectiveness of intervention programs.

ECI 545 Theory and Research in Literacy 3.
Prerequisite: ECI 540.
Advanced study of theoretical models of reading. Research issues in reading and in other language processes. In-depth theoretical models of reading. Emphasis on critical examination and analysis of research investigating reading acquisition, maturereading behavior and related language processes.

ECI 546 New Literacies & Media 3.
Critical analysis of new literacies that are prompted by emerging technologies and participatory media in K-12. Design and application of new literacies and media instructional practices to literacy curriculum and other discipline areas.

ECI 547 Knowledge Construction: Implications for Multicultural Education 3.
Prerequisite: ECI 500.
Exploration of sociopolitical factors involved in the construction of knowledge in education as well as the implications for practitioners and learners in schools and other educational settings. Particular emphasis on critiquing traditional epistemologies that limit the production, dissemination, and validation of progressive discourses in education in order to promote the production of knowledge that affirms the principles of social justice education.

ECI 548 E-Business Applications in Business and Marketing Education 3.
Emphasis on design and construction of advanced web pages, business and marketing applications of electronic commerce, as well as economic, social, legal, and ethical issues that are related to conducting business in a virtual environment. Content prepares students to apply principles to the business and marketing education curriculum in the public schools. Credit for both ECI 448 and ECI 548 is not allowed.

ECI 549 Special Problems in Reading 1-6.
Prerequisite: Six hours of ED or PSY.
In-depth study of topical problems in reading education selected from areas of current concern to practitioners in education.

ECI 550 Foundations Of Middle Years Education 3.
Prerequisite: 6 hours of ED or PSY.
Examination of five major aspects of middle years education: (a) history and purposes of middle/junior high school, (b) pre- and early adolescent needs, interests and abilities, (c) curriculum design and content, (d) teaching methods and (e) school organization. Emphasis on both theoretical understandings and effective classroom strategies.

ECI 551 Teaching/Learning Approaches For Emerging Adolescents 3.
Prerequisite: ECI 550; Graduate standing.
Exploration of teaching/learning approaches appropriate to emerging adolescents. Learning styles; interdisciplinary inquiry; community-based curriculum; simulations and games; learning centers; minicourses; design of physical space; all-school activities.

ECI 552 Program Development & Evaluation in Youth & Family Settings 3.
Historical and contemporary foundations of program development and evaluation in non-formal, community-based family life and youth development settings are examined including theory, research, and three holistic program development constructs: 1) planning; 2) design and implementation; 3) impact evaluation and accountability.

ECI 553 Applied Concepts in Child and Youth Development 3.
This course explores the fundamental concepts of child and youth development (including early childhood through adolescence) as applied to programmatic and organizational contexts. A special focus is placed upon the concepts as applied to Community Youth theories & practice.

ECI 554 Collaborations & Partnerships in Family & Youth Settings 3.
To prepare educators (formal and non-formal) to better establish, lead and manage collaborations and partnerships in family settings and those that support holistic community-based youth development organizational systems. Specific foci include: types and levels of partnerships; environmental scanning and socio-organizational linkage contextual factors affecting community collaborations; leadership factors affecting community collaborations; and human, financial and programmatic management in collaborations. Some on-campus meetings are required.

ECI 556 Organizational Systems in Youth and Family Settings 3.
Prerequisite: ECI 506.
Preparation for current and future community family and youth development professionals leading and managing community-based organizations. Course includes: fundamentals of management and leadership; institutional and organizational structures; administrative and strategic planning; working with advisory and governing groups; marketing and program delivery systems; information management systems; and human resource, financial, facilities and risk management systems.

ECI 557 Volunteerism in Youth and Family Settings 3.
Preparation for current and future community-based youth and family professionals to better manage volunteers in local program service delivery. Specific foci include: volunteerism as a social phenomenon; volunteer resource management; new forms of volunteerism; and future trends in volunteerism. Restricted to graduate and post-baccalaureate students only.
ECI 560 Professional Development in Business and Marketing Education 3.
Prerequisite: Graduate standing.
Designed to prepare business and marketing educators with the knowledge and skills necessary to design and implement strategies for organizational improvement that will benefit business and marketing education programs. Attendance and participation meaningful, organized professional development activity is an integral component of the course.

ECI 561 Curriculum and Instruction in Business and Marketing Education 3.
Prerequisite: Graduate standing.
Designed to develop competencies needed to be a successful Business and Marketing Education Teacher-Coordinator. Focus primarily on the activities involved in planning and managing the curriculum and instructional skills needed to effectively implement the curriculum and meet educational needs of middle and high school students. For ED & MKZ students only. Requires permission of instructor.

ECI 562 Program Management in Business and Marketing Education 3.
Prerequisite: ECI 561.
This course includes the administration of middle and secondary business and marketing education programs, including career guidance; the management of DECA or FBLA chapter; supervision of work-based learning strategies; and school program promotion and development. ED & MKZ students only. Requires permission of instructor.

ECI 563 is a course that involves teaching techniques, innovations, development of teaching and evaluation skills, and in-depth subject matter inquiry in the area of secondary school social studies. Adaptation of instruction to individual learner differences, and selection and design of instructional materials will be explored. Must be enrolled in Secondary Social Studies MAT Program.

ECI 566 Advanced Instructional Strategies in Business and Marketing 3.
Prerequisite: ECI 561.
Advanced strategies and techniques related to teaching and learning in the business and marketing education curricula, classrooms, work places, and technology environments in middle and secondary education. MKZ students only.

ECI 567 Career and Technical Education Fundamentals and Program Administration 3.
Emphasis on assisting various school district personnel in acquiring the knowledge and skills needed to effectively provide quality career and technical education (CTE) programming at the district level. Content includes federal CTE legislation, theory and research on educational reform, local and regional economic development, sources of funding for CTE programming and continuous improvement.

ECI 568 Designing College and Career Ready Programs 3.
Examination of current school system instructional practices to assist various school district personnel in aligning core academic and career and technical education programming to prepare students for successful post-secondary education, careers, and life-long learning. Content includes an examination of education reform initiatives with an emphasis on foundational theory and research, needed workplace knowledge and skills, innovative education programs/models, and research-based best practices for success in transitioning students to post-secondary success.

ECI 569 Special Problems in Business and Marketing Education 1-6.
In-depth study of topical problems in business and marketing education selected from areas of current concern to practitioners in education.

ECI 570 Learning Disabilities 3.
Prerequisite: ECI 585.
Field of learning disabilities, including definitions, prevalence, etiology, characteristics and current educational trends for educating students with learning disabilities.

ECI 571 Methods and Materials In Learning Disabilities 3.
Current methods and materials for the teaching students with learning disabilities in elementary and/or secondary schools, including curriculum and instructional techniques. Focus on examination of commercial materials and development of teacher-made materials for use with students with learning disabilities.

ECI 572 Resource Teaching In Special Education 3.
Prerequisite: ECI 585.
Resource teaching in area of special education, with emphasis on resource teaching with students with special needs. Types of resource programs, establishment and maintenance of a program, selection of students, curriculum and materials.

ECI 573 Applied Behavior Analysis for Teachers 3.
Concepts and procedures involved in design and implementation of techniques for managing the behavior of students in classroom setting. Focus on methods for defining, measuring, increasing, decreasing, maintaining, and generalizing classroom behaviors in all learners.

ECI 574 Intellectual Disabilities 3.
Prerequisite: ECI 585.
Content presented includes definitions, classifications, and assessment of person with intellectual disability from medical, sociological, and educational points of view. Issues related to labeling, etiology, characteristics, levels of severity, litigation, legislation, family and societal issues, history, and controversies are emphasized related to persons with intellectual disability.

ECI 575 Communication Disorders In the Classroom 3.
Prerequisite: ECI 570.
Occurrence of communication disorders in the school-age population, including types of disorders, prevalence, etiology, characteristics and corrective therapy. Focus on communication disorders among exceptional students and classroom teacher's role in working with communication disorders.

ECI 576 Teaching Functional and Life Skills to Students with Disabilities 3.
Prerequisite: ECI 585 and ECI 574.
Methods of instruction and materials related to teaching children and persons with mild-moderate levels of disability are emphasized. Effective general pedagogical approaches are stressed, as well as the teaching of functional academic skills, curricula used in instructions, teaching social and adaptive behavior as well as daily living skills, and transition-related skills necessary for independent adult life.

ECI 577 Education Of Severely Handicapped 3.
Prerequisite: ECI 585 or ECI 574.
Severe and profound mental retardation and autism, including assessment procedures, educational and social/vocational programs, instructional strategies and evaluation. Legal and ethical issues involved in working with severely handicapped.
ECI 579 Organization and Behavioral Management of Inclusive Classrooms 3.
To increase students' knowledge of persons with high incidence disabilities (i.e., learning disability, mild intellectual disability, and serious emotional disability), and how to manage the behavior of all pupils in educational environments. Characteristics of students with high incidence disabilities will be emphasized, as well as strategies to reduce the likelihood of problem behavior of all pupils in the classroom.

ECI 580 Transition Program For Students With Mild Disabilities 3.
Prerequisite: ECI 585.
Educational and other procedures involved in providing transition programming to students with mild disabilities. Examination of secondary-level special education service delivery, as well as post-secondary interventions, from critical, practical, empirical and theoretical perspectives.

ECI 581 Educational Diagnosis and Prescription For Children With Exceptionalities 3.
Prerequisite: ECI 585.
Concept of educational diagnosis of students with exceptionalities, including examination of educational diagnostic procedures in current use in special education. Development of informal diagnostic techniques and procedures for adapting curriculum and instruction for learner with exceptionalities.

ECI 583 Behavior Disorders 3.
Prerequisite: ECI 585.
Definitions, etiology, characteristics, philosophies and approaches to educational programming for children and youth with behavior disorders, including emotionally handicapped, autistic and socially maladjusted.

ECI 584 Intervention for Behavior Problems of Students with Disabilities 3.
Prerequisite: ECI 583.
Curriculum materials, instructional strategies and behavior management techniques related to teaching children and youth with behavioral disorders including individualized instruction, group process, organization and evaluation of classroom programs, parent involvement, community resources and teachers' personal and professional growth and development.

ECI 585 Education Of Exceptional Children 3.
Prerequisite: 9 hrs. of ED or PSY.
Introduction to field of special education. Focus on historical overview, definitions and terminology in basic areas of exceptionality; etiological factors in exceptionality; developmental and learning characteristics of each area of exceptionality; and educational settings and strategies employed in special education. Review of current educational laws and policies affecting special education.

ECI 603 Advanced Seminar In Literacy Research 3-6.
Prerequisite: ECI 648.
Critical analyses of research and methodology in reading comprehension processes and strategies for comprehension and retention of written discourse. Opportunity for design and conduct of a research project in reading or related area.

ECI 604 Seminar on Teacher as Learner: Developmental Theory, Research and Practice 3.
Prerequisite: Graduate standing (6 hrs course work at 500-level).
Analysis of major contemporary theories and research of learning and development as a basis for individual and organizational change and development in educational settings.

ECI 607 Advanced Seminar in Multicultural Education 3.
Prerequisite: Graduate standing and ECI 500.
Application and analysis of research and scholarship in multicultural education and topics related to effective schools for contemporary culturally diverse student populations in K-12 settings.

ECI 620 Special Problems In Curriculum and Instruction 1-6.
Prerequisite: Six hrs. of ED or PSY.
In-depth study of topical problems in curriculum and instruction selected from areas of current concern to practitioners in education.

ECI 630 Independent Study in Curriculum and Instruction 1-6.
Independent curriculum or research project in curriculum and instruction.

ECI 640 Practicum In Curriculum and Instruction 1-6.
Prerequisite: Graduate standing in Col. of ED and PSY.
Supervised practical experiences in schools and area agencies concerned with curriculum and instruction or educational supervision.

ECI 641 Practicum In Mentoring and Coaching 1-6.
Prerequisite: ECI 705, Graduate standing in College of ED and PSY.
Supervised practical experiences in which participants become mentor to a student teacher or a teacher in a school system.

ECI 645 Diagnostic-Prescriptive Practicum in Reading 3.
Prerequisite: ECI 540, ECI 541 and ECI 543; Graduate standing in College of ED and PSY.
Supervised teaching experience with students using diagnostic test data to prescribe remedial programs for reading-disabled individuals, implementing instructional prescriptions and evaluating success of remedial plans.

ECI 647 Practicum in Business and Marketing Education 3.
Prerequisite: ECI 569.
Supervised practical experiences in schools and area agencies concerned with business and marketing education.

ECI 648 Practicum in Special Education 1-6.
Prerequisite: Graduate standing in College of ED and PSY.
Supervised practical experiences in schools and area agencies concerned with teaching children and adolescents with disabilities.

ECI 650 Internship in Curriculum and Instruction 1-6.
Prerequisite: Graduate standing in Col. of ED and PSY.
Supervised opportunities for advanced professional development in contexts concerned with curriculum development and/or educational supervision.

ECI 652 Field-Based Applications of Digital Learning and Teaching 1-6.
Prerequisite: Graduate standing in Col. of ED and PSY.
Supervised opportunities to design, test, and revise digital learning and teaching solutions in authentic, field-based settings.

ECI 654 Internship In Elementary Education 1-6.
Prerequisite: 3 hrs. grad.-level elementary education course work, Graduate standing in Col. of ED and PSY.
Supervised opportunities for advanced professional development in contexts concerned with elementary education.

ECI 656 Internship In Middle Grades Education 1-6.
Prerequisite: ECI 550, ECI 551, Graduate standing in College. of ED and PSY.
Supervised opportunities for advanced professional development in contexts concerned with the education of young adolescents.
ECI 657 Internship in Business and Marketing Education 1-6.
Prerequisite: ECI 561.
Supervised opportunities for advance professional development in contexts concerned with business and marketing education. Requires instructor approval.

ECI 658 Internship in Special Education 1-6.
Prerequisite: Graduate standing in Col. of ED and PSY.
Supervised opportunities for advanced professional development in contexts concerned with special education.

ECI 661 Seminar in Special Education Literacy 3.
Prerequisite: ECI 540 or ECI 541 and ECI 581, ECI 585.
A case study approach is used in the seminar that requires the application of assessment techniques and instructional intervention methodologies in literacy for K-12 students with disabilities. Assigned activities require access to and experience in schools and/or related settings. This seminar is designed to be completed during the last half of the graduate program. It is restricted to graduate students in SPE, SPL, SPM, SPB or consent of instructor.

Prerequisite: ECI 585.
This seminar is designed to prepare special education teachers to provide empirically supported instruction in numerical concepts and skills to students with disabilities in special education and general education settings. Particular attention will be paid to student characteristics that impact learning in arithmetic and mathematics and to addressing state and national curriculum standards using instructional organization and strategies that have been shown through research to be effective for this population. Field work in schools and/or related settings is required. Restricted to students in SPE, SPB, SPL, SPM or by consent of instructor.

ECI 683 Seminar in Special Education Learning Strategies 3.
Prerequisite: ECI 585.
This seminar is designed to prepare special education teachers to evaluate and teach empirically supported learning strategies to students with disabilities in special education and collaborative settings. Particular attention will be paid to learning strategies shown to help students with disabilities organize, learn, and apply facts, skills and routines that provide access to and mastery of critical information across the curriculum. Field work in schools and/or related settings is required. Restricted to graduate students in SPE, SPB, SPL, SPM or consent of instructor.

ECI 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ECI 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

ECI 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

ECI 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

ECI 692 Research Projects In Curriculum and Instruction 1-3.
Prerequisite: ELP 532.
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students’ interests and not to be part of thesis or dissertation research.

ECI 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

ECI 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

ECI 700 Curriculum Theory and Development 3.
Prerequisite: 9 sem. hrs. graduate PSY, ECI 502, ECI 514.
Theory and research in behavioral sciences and education designed to provide theoretical background for development of elementary and secondary curricula. Exploration of knowledge base and skills for critical review of curricula and instructional materials and provision of an application opportunity.

ECI 705 Instructional Coaching and Supervision Of Teachers 3.
Theory, research and practice of the professional role of a supervisor in the development of the effective and self-analytic teacher: pre-service (student teacher) and in-service (beginning and experienced teacher). For persons with at least two years of teaching experience in K-12 schools.

ECI 709 Special Problems In Curriculum and Instruction 1-6.
Prerequisite: Six hrs. of ED or PSY.
In-depth study of topical problems in curriculum and instruction selected from areas of current concern to practitioners in education.

ECI 711 Computer Applications and Curriculum Integration 3.
Prerequisite: Graduate standing.
Use and evaluation of existing educational software, research findings with respect to integration of computers and new technologies in instruction.
ECI 714 Multimedia Design and Applications in Instruction 3. 
Prerequisite: Six hrs. ED or PSY.
Emphasis on use and evaluation of existing educational software and 
research findings with respect to uses of computers in instruction.

ECI 715 Internet Applications and Web Page Design in Instruction 3. 
Prerequisite: Six hrs. ED or PSY.
Instructional design principles underlying development of microcomputer- 
based instructional software and accompanying materials and 
programming principles and their implementation in courseware 
development. Additional topics include authoring languages, 
programming languages and graphics.

ECI 716 Design and Evaluation Of Instructional Materials 3. 
Prerequisite: Graduate standing.
Characteristics and selection of various media for instruction and their 
use in educational settings. Design and production of instructional 
materials. Analysis of research in the field. Individualized projects and 
assignments. Application of grounded research and theory concerning 
learning to design of instructional materials. Structured projects and 
practical experiences used to transfer design principles and evaluate 
instructional products.

ECI 717 Advanced Multimedia Design and Applications in 
Instruction 3. 
Prerequisite: ECI 511, ECI 514.
Advanced study and application of instructional design principles 
underlying development, evaluation, and integration of multimedia and 
hypermedia in K-12 settings.

ECI 718 Digital Learning Program and Staff Development 3. 
Prerequisite: ECI 511, ECI 514, ECI 515, ECI 642.
Study and application of principles related to digital learning program 
planning, facilities and resource management, and staff development in 
K-12 settings.

ECI 719 Special Problems in Digital Learning and Teaching 1-6. 
Prerequisite: Six hours of ED or PSY.
In-depth study of topical problems in digital learning and teaching 
selected from areas of current concern to practitioners in education.

ECI 720 The Teaching Of Composition 3. 
Prerequisite: 9 hrs. of ED, PSY and/or ENG; to take this course in sum. 
as part of Capital Area Writing Project, student must apply and be 
selected.
For classroom teachers. Practical field-tested ideas to help students 
improve as writers by focusing on composition as a process as well as a 
product. Activities for teaching prewriting, drafting, revising, proofreading, 
grammar and evaluating with suggestions for individual and group 
learning. Writing in content areas and composition research/ theory.

ECI 727 Special Problems in Social Studies Education 1-6. 
Prerequisite: Six hours of ED or PSY.
In-depth study of topical problems in social studies education selected 
from areas of current concern to practitioners in education.

ECI 729 Special Problems in English Education 1-6. 
Prerequisite: Six hours of ED or PSY.
In-depth study of topical problems in English education selected from 
areas of current concern to practitioners in education.
ECI 851 Internship In Mentoring 1-6.
Prerequisite: ECI 845 and ECI 705, Graduate standing in Col. of ED and PSY.
Supervised opportunities teaching educational personnel in local school systems how to serve as mentors to their colleagues.

ECI 880 Directed Study in Curriculum and Instruction 1-6.
Curriculum or research project in curriculum and instruction under the direct supervision of a faculty member.

ECI 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ECI 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

ECI 892 Research Projects In Curriculum and Instruction 1-3.
Prerequisite: ELP 732.
Project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

ECI 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

DAN 272 Dance Composition 1.
Prerequisite: HESD 264 or HESD 274 or permission of instructor.
This course introduces principles of dance composition through creative problem solving. Course content includes: movement invention; creation of a thematic phrase; manipulation and development of theme through application of choreographic devices; structure; and content. Student will create and perform a complete solo choreographic work in the course. A small fee may be required for dance concert attendance.

DAN 290 Special Topics in Dance 1-4.
Examination of selected topics in dance. May be repeated for credit provided course content is different each time.

DAN 295 Problems of Dance Performance 2.
Prerequisite: Audition.
Practical performing experience in a company setting. Rehearsal, performance and production of concert dance.

DAN 498 Independent Study in Dance 1-3.
Prerequisite: DAN 272, DAN 295, Dance Program approval required.
Independent study in special choreographic or performance projects approved by and done under the direction of the Dance Program. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Design (D)

D - Design Courses

D 100 Design Inquiry I: Methods and Processes 3.
Design Inquiry I asks students to think critically about and experiment with expanding their toolkit of process and methods in solving large scale problems with innovative solutions. Through discussion sections, students will also be introduced to methods of critical reading and writing as a reflective practice. Topics students will consider and implement include lateral thinking, metaphorical thinking, abductive reasoning, networked thinking, discourse as thought, systems thinking and more. Students in Design must receive a C- to pass the course.

D 101 Design Inquiry II: Methods and Processes 3.
As an important extension of the first semester, Design Inquiry II asks students to engage in the critical evaluation of the making process and how design and the artifacts that we create contribute to material culture. Lecture topics are both historical and contemporary and include: design in the age of reason, the age of composition, and the age of experience; consumption and material culture; designing the obsolete; human-centered design, and universal design. Student in Design must receive a C- to pass the course.

D 102 Design Culture and Context I 3.
Design Culture and Context I is an interdisciplinary survey of the impact of culture on the ideas, styles and expressions of art and design during the 19th and 20th centuries. With a focus on the United States and societies around the globe, a variety and material references from architecture, industrial design, textile and clothing manufacture, the arts, graphic design, film and new media will be used to explore the “big picture” of the things people create—material culture—within a frame of significance, utility and public need.
D 103 Design Culture and Context II 3.
Prerequisite: D 102.
Design Culture and Context II examines design action and the relationships between design and other systems, chiefly the natural and built environment, society and culture, and technology and economics. Case studies presented by affiliate College of Design faculty, professionals and principle investigators in Universal Design, Natural Learning and Museum Practice will introduce students to the cultural implications of crafting meaningful solutions to current challenges and public needs.

D 104 First Year Studio I 6.
Co-requisite: D 100; restricted to Design majors only.
First Year Studio I provides College of Design freshman with an introduction to foundational design concepts and methods representative of creative activity across design and artistic disciplines. This 6-credit fall semester course encourages entering freshman to think critically and act creatively about and upon design, art and the world around them as they secure a skillful level of craftsmanship in the conception, development, and making of all studio-based work. Semester work focuses on key design issues such as process, method, technique, technology and the production of visual and physical items necessary for the envisioning and development of design. College of Design Studio Majors Only; Students must receive a C- to pass the course.

D 105 First Year Studio II 6.
Prerequisite: D 100 and D 104; Corequisite: D 101; Restricted to Design majors only.
First Year Studio II is the continuation of a comprehensive introduction to foundational design concepts and methods begun in First Year Studio I. This 6-credit fall semester course asks freshman to think critically and act creatively about and upon design, art, and the world around them as they apply a skillful level of craftsmanship in the conception, development, and making of all studio-based work. In this second semester studio, students acquire further knowledge of design and art through assignments and projects that describe a more complex scope of challenges than in the previous first semester studio. College of Design Studio Majors Only; Students must receive a C- to pass the course.

D 231 Design History for Engineers and Scientists 3.
Study of historical connections among various disciplines and across cultures from prehistory to the present, with an emphasis on design. Students develop visual timelines of events to better understand how seemingly disparate disciplines affect one another. Special attention paid to scientific, artistic, and philosophical "revolutions" and their impact upon each other and upon other intellectual and practical endeavors.

D 292 Special Topics in Design 1-3.
Topics of current interest in the college of Design. Used to develop new courses.

D 492 Special Topics in Design 1-6.
Topics of current interest in the College of Design. Used to develop new courses.

D 592 Special Topics in Design 1-6.
Prerequisite: Graduate standing.
Topics of current interest in the College of Design. Used to develop new courses.

D 684 Teaching Design at the College Level 3.
Prerequisite: D 102.
Preparation for college level teaching in the design disciplines. Discussion of the history of design education, curriculum development, pedagogical strategies, assessment, and teaching and research demands on college design faculty. Meets partial requirements for the university Certificate of Accomplishment in Teaching. Restricted to students enrolled in College of Design masters and doctoral programs.

Design Fundamentals (DF)

DF - DF Courses

Prerequisite: Design Majors.
Introduction to the design disciplines and departments of the College of Design. A studio course examining the techniques and attitudes for dealing with identification, solution and evaluation of problems arising from the design of physical artifacts in the natural and built environment. The design studio process includes the acquisition of languages and skills appropriate to design studies.

Design Studies (DS)

DS - Design Studies Courses

DS 101 History of Design I, From Before the Apple to Xia Gui 3.
Prerequisite: Completion of all course work in DS through junior year; Design Studies Majors.
Each student in Design Studies will develop a topic for her Senior Capstone Research Paper to be done during the Spring term. During the Research semester, each student will develop a comprehensive bibliography for the topic and an outline of the paper. One paper will be written before the end of the term that addresses issues directly related to the Capstone Research paper. Throughout the term, students will share their research with others in the seminar.

DS 481 Design Studies Senior Research Seminar 3.
Prerequisite: DS 481; Design Studies Majors.
Each student in Design Studies will develop a topic for his or her Senior Capstone Research Paper to be done during the Spring term. During the Research semester, each student will develop a comprehensive bibliography for the topic and an outline of the paper. One paper will be written before the end of the term that addresses issues directly related to the Capstone Research paper. Throughout the term, students will share their research with others in the seminar.

DS 482 Design Studies Capstone Seminar 1.
Prerequisite: DS 481; Design Studies Majors.
Students will meet on a weekly basis to discuss their individual research papers. Drafts of papers will be due at the end of the eighth week of class. Drafts will be read by the instructor, other instructors of the student's choosing, and by two other members of the class for critical analysis.

Prerequisite: DS 481; Design Studies Majors.
Course consists of guided independent study resulting in a serious research paper. Students will work on their own, with meetings with faculty advisor(s) at weekly intervals.
DS 494 Design Studies Internship 1-6.
Prerequisite: Junior or Senior Standing in Design Studies Program; Design Studies Majors.
Supervised internships in museums, galleries, schools, or other approved venues, in which students are engaged in activities related to Design Studies. Students are responsible for transportation to and from internship. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

EGR - Engineering Master's (EGR)

EGR 501 Engineering Leadership and Strategic Change 3.
In the current business environment, an understanding of leadership and change management is essential to career success. The objective of this course is to provide practitioners in technical fields the knowledge to lead, align and transform the human element, individuals and teams, to achieve organizational performance excellence. The class includes both individual and collaborative (team) learning. An engineering, technical, or scientific undergraduate degree is required.

EGR 503 Statistical Engineering using Six Sigma DMAIC Process 3.
ST 361 or ST 370 or Entry Level Statistics
Statistical Engineering: systematic approach (Six Sigma DMAIC methodology) for improving manufacturing and business processes and products using advanced graphical and statistical methods. Defining the improvement opportunity, measurement system analysis (MSA), Failure Mode and Effects Analysis (FMEA), data collection, graphical and statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of statistical engineering to business and manufacturing case studies.

EGR 505 Managerial Finance for Engineers 3.
In the current business environment, familiarity with and appreciation of finance is essential to career success. Technically competent managers must be able to speak the common language of business and to understand how their work affects the performance of their organization. The objective of this course is to provide practitioners in technical fields the financial know-how to plan, control and make decisions that achieve organizational performance excellence. The class includes both individual and collaborative (team) learning. An engineering, technical or scientific undergraduate degree is required.

EGR 506 Managing New Hi Tech Product Launches 3.
Requirement: Graduate standing in Engineering.
This course covers new high-tech product development and launch from the perspective of the technical manager responsible for developing and launching new products and new lines of business within the high tech firm. Topics cover the entire spectrum of the new products development and launch process starting from concept generation and ideation and concept evaluation all the way through market testing and product launch. Each phase of the new products management process will be covered and illustrated by case studies. Students will generate a new product development and launch plan as a course project. 3 credit hours.

EGR 507 Product Life Cycle Management 3.
Requirement: Graduate standing in Engineering.
This course covers the management of complex technical products during all phases of the product life cycle. It is a broad survey of all the tools needed by the technical product manager throughout the life cycle of a complex product. The course is taught with a systems approach and from the engineering manager's viewpoint. The product life cycle includes all aspects of managing products from launch through maturity.

EGR 590 Special Topics in Engineering 1-6.
Discussion of special topics in engineering. Identification of various specific topics and prerequisites for each section from term to term.

EGR 688 Non-Thesis Masters Continuous Registration-Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, final master's exam, etc.

Ecology (ECO)

ECO - Ecology Courses

ECO 601 Ecology Seminar 1.
Prerequisite: Graduate standing.
Scientific articles, progress reports and special problems of interest to ecologists are reviewed and discussed. Minimum of one seminar presentation required for credit.

Economics (EC)

EC - Economics Courses

EC 201 Principles of Microeconomics 3.
Credit is not allowed for both EC 201 and EC 205 or ARE 201.
Scarcity, production possibilities, and opportunity cost. Supply and demand analysis, free markets, the price system, and government policy. Microeconomic analysis of business decisions in competitive and noncompetitive markets. Labor markets, capital, and natural resource markets, and externalities. Market break down, income redistribution, and role of government. Free trade, tariffs, and gains from international trade. Credit will not be given for both EC 201 and either ARE 201 or EC 205.

EC 202 Principles of Macroeconomics 3.
Prerequisite: EC 201 or ARE 201 or EC 205.
Aggregate economic analysis emphasizing current public policy issues. Determinants of level and rate of growth of total output. Causes of unemployment and business cycles, inflation, and exchange rate fluctuations. Effects of monetary policy (money supply) and fiscal policy (government spending, taxes, deficits) on these problems. Trade surpluses/deficits and impact of international events and policies on national economies. Credit will not be given for both EC 202 and EC 205.
EC 205 Fundamentals of Economics 3.
Credit is not allowed for both EC 205 and EC 201 or ARE 201 or EC 202.
Fundamental ideas in economics: scarcity, substitution, opportunity cost, marginal analysis, gross domestic product, real and nominal magnitudes. Supply and demand analysis. Microeconomic analysis of pricing in competitive and noncompetitive markets. Macroeconomic analysis of production, employment, the price level, and inflation. Monetary and fiscal policy and the stabilization of the economy. Comparative advantage and international trade. Credit will not be given for both EC 205 and either EC 201 or ARE 201. Credit will not be given for both EC 205 and EC 202.

EC 301 Intermediate Microeconomics 3.
Prerequisite: MA 121 or 131 or MA 141; EC 201 or EC 205 or ARE 201.
Credit is not allowed for both EC 301 and EC 310.
Functioning of the market economy, role of prices in determining the allocation of resources, the functioning of the firm in the economy, forces governing the production and consumption of economic goods. Credit not allowed in more than one of EC 301, 310, 401.

EC 302 Intermediate Macroeconomics 3.
Prerequisite: (EC 201 or EC 205 or ARE 201) and (MA 121 or MA 131 or MA 141).
Applied, analytical course in aggregate economics: business cycles, stabilization policy, inflation, costs of disinflation, international trade, and economic growth. Interaction of consumers and businesses with government economic policies; unemployment, interest rates, and output growth. Impacts of government deficits, trade deficits, and monetary policies.

EC 305 A Closer Look at Capitalism 3.
Prerequisite: EC 201 or EC 205 or ARE 201.
Comparison of market allocation to government allocation. Criteria for evaluating economic systems. How markets create value. Relationship of economic freedom to political freedom and economic growth. Applications to policies such as antitrust policy, education policy, and environmental policy.

Prerequisite: ARE 201 or EC 201 or EC 205.
Application of basic economic tools to understand and evaluate environmental/resource policies. Concepts such as property rights, non-market goods, allocation over time, externalities, and public goods. Current policy issues such as global climate change, evaluating natural resource damages from oil spills, reducing the costs of regulations, protecting estuaries, and dealing with non-point source pollution.

EC 348 Introduction to International Economics 3.
Prerequisite: EC 201 or EC 205 or ARE 201.
Application of basic economic analysis to international economic events and policies. Gains from trade, impacts of trade restrictions, international systems of payments, global capital markets, and balancing international with domestic macroeconomic policies. Current policy issues such as economic integration (customs unions and free trade areas), a common European currency, and the role of international trade in economic growth and development.

EC 351 Data Analysis for Economists 3.
Prerequisite: (BUS/ST 350 or ST 302 or ST 361 or ST 370 or ST 372).
Tools for describing and analyzing data as used in economics. Probability, random variables, sampling, point and interval estimation. Hypothesis testing and regression analysis with emphasis on economic applications.

Prerequisite: EC 201 or 205 or ARE 201.
The institutional, philosophical and economic foundations of markets. Social and political implications of private property, voluntarism and the forms of social cooperation derived from markets. The effects of public policies intended to alter the economic outcomes of markets. The morality of markets, legal and institutional settings, cooperation and the nature of exchange, the social function of prices.

Prerequisite: (EC 302 or BUS 320) and (BUS/ST 350, or ST 302, or ST 361, or ST 370, or ST 372). Credit is not allowed for both EC 404 and EC 304.
Roles of money, credit, and financial institutions in the modern economy. Determination of level and structure of interest rates and exchange rates, determination of security prices. Management and regulation of financial institutions. Federal Reserve System and monetary policy. Statistical analysis of financial and monetary data. Credit will not be given for both EC 304 and EC 404.

EC 410 Public Finance 3.
Prerequisite: EC/ARE 301 or EC 310.
A micro-economic analysis of the rationale for public expenditure and taxation. Externalities, pollution and public policy, income redistribution and public welfare, public goods, collective choice and political institutions, public budgeting techniques and cost-benefit analysis, taxation and tax policy, state-local finance and fiscal federalism.

EC 413 Competition, Monopoly and Public Policy 3.
Prerequisite: EC/ARE 301 or EC 310.
Current theories of industrial organization with specific reference to such topics as cartels, industrial concentration, vertical integration, franchise contracts, ownership and control of firms, multipart and discriminatory pricing, and tie-in sales. Economic aspects of antitrust law and government regulation of industry.

EC 417 Labor Economics 3.
Prerequisite: EC/ARE 301 or EC 310.
An economic approach to the labor market and its problems including unemployment and the determination of wages, hours and working conditions under various labor market structures. The economic effects of trade unions. Introduction to human capital theory.

EC 431 Competition, Monopoly and Public Policy 3.
Prerequisite: EC/ARE 301 or EC 310.
A micro-economic analysis of the rationale for public expenditure and taxation. Externalities, pollution and public policy, income redistribution and public welfare, public goods, collective choice and political institutions, public budgeting techniques and cost-benefit analysis, taxation and tax policy, state-local finance and fiscal federalism.

EC 436 Environmental Economics 3.
Prerequisite: EC/ARE 301 or EC 310.
Usefulness of economics in understanding pollution, congestion, conservation and other environmental problems. Relevant economic tools such as pricing schemes, abatement cost curves, damage functions and benefit-cost analysis. Pollution taxes, regulations, marketable permits and subsidies considered in designing alterations, in the incentive system. Current public policy alternatives in the context of non-market decision-making.

EC 437 Health Economics 3.
Prerequisite: EC/ARE 301 or EC 310.
Application of micro-economic tools to the analysis of public and private policy issues concerning health care financing and delivery in the United States.

EC 449 International Finance 3.
Prerequisite: EC/ARE 301 or EC 310.
Study of international markets and their effects on firms, investors and national economics. Topics include: futures and options in foreign exchange, management of foreign exchange risk, exchange rate determination, and macroeconomic policy in an open economy.
EC 451 Introduction to Econometrics 3.
Prerequisite: (EC/ARE 301 or EC 310) and EC 302 and EC/ST 351.
The measurement, specification, estimation and interpretation of
functional relationships through single equation least-square techniques.
Applications of simple and multiple regression, curvilinear regression and
various transformations to demand, cost, production, consumption and
investment relationships.

EC 474 Economics of Financial Institutions and Markets 3.
Prerequisite: (MA 121 or MA 131 or MA 141), and (BUS 320 or EC 302).
Management, development and regulation of U.S. financial markets
and institutions. Management of major financial intermediaries and
their historical development. Analysis of major financial assets and their
markets. The role and history of the Federal Reserve and other financial
regulators.

EC 480 Introduction to Economic Research 3.
Prerequisite: (EC 301 or EC 310) and (BUS/ST 350, or ST 302, or
ST 361, or ST 370, or ST 372).
Finding economic data. Critically analyzing newspaper and journal
articles using economic reasoning. Developing, writing, and presenting
economic analysis.

EC 490 Research Seminar in Economics 3.
Prerequisite: (EC/ARE 301 or EC 310) and EC 302; and (BUS/ST 350, or ST 302, or
ST 361, or ST 370, or ST 372).
The final course for students completing the undergraduate programs in
economics. Students study a selected economic issue, make classroom
presentations related to the seminar topic, and write research papers.

EC 495 Special Topics in Economics 1-6.
Examination of special topics in economics not normally treated in other
courses, or offering of new courses on a trial basis.

EC 498 Independent Study in Economics 1-6.
Detailed investigation of topics of particular interest to advanced
undergraduates under faculty direction on a tutorial basis. Credits and
content determined by faculty member in consultation with Director
of Undergraduate Programs. Individualized/Independent Study and
Research courses require a "Course Agreement for Students Enrolled in
Non-Standard Courses" be completed by the student and faculty member
prior to registration by the department.

Educ Leadership & Program Eval (ELP)

ELP - Educ Leadership Program Eval Courses

ELP 296 Special Topics in Education: General Studies 1-3.
Individual or group study of particular areas of education at the freshman
and sophomore levels. Specific topics will vary from semester to
semester.

ELP 344 School and Society 3.
Prerequisite: Junior standing.
The interrelationship between the school and other institutions, values,
and patterns of thought in American society.

ELP 496 Special Topics in Education: General Studies 1-3.
Prerequisite: Junior standing or Senior standing.
Individual or group study of special topics in professional education. The
topic and mode of study are determined by the faculty member after
discussion with the student.

ELP 518 Introduction To Education Law 3.
Relationship of constitutional, statutory and case law to elementary
and secondary public school settings, particularly in areas of students,
teachers and liability. Particular emphasis on N.C. and federal law.

ELP 532 Introduction To Educational Inquiry 3.
Prerequisite: Graduate standing or PBS status.
Basic concepts and methods of educational inquiry. Emphasis on logic
underlying various approaches to problem definition and solution and on
tools of investigator, as well as on sources and interpretation of research
information related to student's particular area of study.

ELP 534 Ethics and Educational Decision Making 3.
Application of moral theories and methods of moral reasoning to
problems and issues involving educational policy and decision making.
Character of morality; moral autonomy and leadership; intellectual
freedom and public interest; authority and education; punishment and
due process; and leadership and rationality.

ELP 550 Principles of Educational Leadership and Empowerment 3.
Examines school organization theories and critical domains of leadership
(e.g., school vision, culture, management, collaboration, ethics, and
environments). Develops conceptual, managerial and interpersonal
leadership skills through analysis of school goals and purpose;
organizational design, development and improvement; curricular and
instructional leadership; and school-community relationships. Instructional
activities will include lecture, seminar discussion, case and problem-
based analysis. Graduate standing required.

ELP 551 Context and Challenges of School Improvement 3.
Examination of social, cultural, political and policy environment of
schooling with emphasis on NC. Analysis of major theories of school
change and development. critical examination of opportunities and
barriers to strategic change efforts. Instructional activities will include
lecture, seminar discussion, case and problem-based analysis.

ELP 552 School-Based Planning, Management, and Evaluation in
Professional Learning Communities 3.
Prepares administrators to strategically plan, manage and evaluate
core programs and systems for the safe and efficient operation of
schools. Operational domains examined will include information systems,
management systems, curriculum, instruction, student behavior and
school security systems. Instructional activities include lecture, seminar
discussions, case, situation and problem-based analysis.

ELP 553 Organizational Management I: Human Resource
Management in K-12 Education 3.
Examination and application of models, theories, and research pertaining
to personnel appraisal in education, including recruitment hiring,
retention, and dismissal; evaluation models for professional and classified
staff; use of effective professional development models to support
professional growth and development.

ELP 515 Education and Social Diversity 3.
Overview of role of education within a culturally diverse society. Major
attention to racial, socioeconomic and regional subpopulations. Issues
discussed include subcultural influences on public school performances,
equality of educational opportunity, social stratification and mobility, and
the impact of schooling on intergroup relations.
ELP 554 Organizational Management II: Resource Support and Sustainability in K-12 Education 3.
Corequisite: ELP 553.
Theories and practices of funding K-12 education including examination of: political frameworks and policy issues; concepts central to education finance and budgeting; purposes, designs, and uses of school budgets; procedures for generating, analyzing and interpreting issues related to education finance and school budgeting. Construct, manage and analyze school and district-level budgets; address issues of economic efficiency, equity and fiscal adequacy and their fiscal impact on the school community. Understand North Carolina's Uniform Chart of Accounts accounting structure for school budgeting.

ELP 595 Special Topics 1-6.

ELP 620 Special Problems In Education 1-6.
Prerequisite: Graduate standing or PBS status.
Opportunity for graduate students in education to study problem areas in professional education under direction of member of graduate faculty.

ELP 641 Practicum In Education Administration 1-6.
Supervised experience in appropriate educational setting to enable student to gain practice in applying concepts, principles and theories of education administration.

ELP 651 Internship In Educational Leadership and Program Evaluation 1-9.
Prerequisite: Nine hrs. in grad.-level courses.
Utilization of participant-observer role and required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Required development of possible alternative courses of action in various situations, selection of one of alternatives and evaluation of consequences of selected course of action.

ELP 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ELP 692 Master’s Research Projects In Educational Leadership and Program Evaluation 1-3.
Prerequisite: ELP 532.
A project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students’ interests and not to be part of thesis or dissertation research.

ELP 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

ELP 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

ELP 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

ELP 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

ELP 720 Cases In Educational Administration 3.
Prerequisite: Graduate standing.
Utilization of case study and case simulation approach to study of school administration. Development and application of administrative concepts to simulated situations and to actual case histories. View of administrative process as a decision-making process. Student expected to make decisions after considering alternative courses of action and after projecting probable consequences.

ELP 724 Contemporary Educational Thought 3.
Reading and discussion of 20th-century works in educational philosophy. Consideration of such movements as pragmatism, reconstruction, perennialism and existentialism.

ELP 728 School Law For the Administrator 3.
Comprehensive study of constitutional, statutory and case law as related to elementary and secondary school administration. Emphasis on legal issues associated with governance, finance, property, personnel and curriculum.

ELP 729 Educational Finance 3.
Historical and sociopolitical contextual analysis of underlying values, methodologies and policies associated with economic and financial planning of K-12 education (e.g., efficiency, equity, and liberty) and the economic and financial mechanisms used to generate, distribute, and expend revenues for educational purposes.

ELP 735 Policy Research in Education 3.
This course will draw on both classic and contemporary materials in educational policy research and will primarily focus on the substance of policy research rather than methodology. It addresses research pertaining to the foundations, implementation and evaluation of policy in all levels and sectors of the educational system. Major attention will be given to education in the United States, with comparative perspectives included.

ELP 736 Qualitative Research In Education and Policy Analysis 3.
Provision of public school personnel and educational policy analysts with research training and experience to address educational research and policy problems using qualitative methods. Qualitative research design and strategies; data collection, management and analysis; interpretation and writing; qualitative evaluation and formation as applied particularly to educational research and policy analysis.

ELP 737 Advanced Qualitative Applications in School Administration and Policy 3.
Prerequisite: ELP 736.
Application of advanced qualitative methods and action research in school administration and policy analysis. Research proposal development, article preparation, evaluation of qualitative and action research, discussion of theoretical and methodological issues, computer analysis of qualitative data.

ELP 742 Applied Research Methods In Education 3.
Through use of simulated educational settings, consideration given to development of research proposals or plans, selection and/or development of appropriate measurement instruments and purposes and functions of various statistical designs and procedures. Preparation and analysis of simulated data using computer-based statistical packages, interpretation of results and production of a research report.
ELP 751 Politics of P-12 Education 3.
Analysis of political interactions of individuals and groups in P-12 education, specifically, how politics shapes educational decisions within a federal system of governance. Topics covered include micropolitics and macropolitical systems at the school, district, municipal, state, and federal levels, as well as political culture, interest groups, advocacy coalitions, and institutions. Doctoral standing required.

ELP 752 Theories Framing curriculum Inquiry 3.
Prerequisite: Graduate standing.
Introduction to different curricula research paradigms and/or epistemologies and the philosophies upon which they are founded within the context of education. Develop an understanding of the philosophies upon which different research paradigms or epistemologies are found, particularly positivism, realism, neo-realism, interpretivism, phenomenology, hermeneutics, narrative orientations, critical theory, feminism, race-based approaches, lesbian/gay orientations, and postmodernism.

ELP 753 Data Decision Making for School Administrators 3.
Understand the purposes and uses of school data for research-based school improvement. Understand different types of assessment needed for school and district-wide improvement. Develop models of administrative decision making incorporating key goals, resources, curriculum alignment, data, assessment, and evaluation. Doctoral student status required.

ELP 756 Organizational Leadership & Management for School Leaders 3.
Prepares district-level administrators to analyze the changing nature of the superintendency, including major management and leadership responsibilities and leadership approaches. Operational domains examined include school governance and organizational theory, school boards, school district policy, collaborative leadership, material and human resource management, systemic and sustainable reform, contemporary challenges, and personal practices management. Doctoral standing required.

ELP 757 Research in P-12 Administrative Leadership 3.
Apply theories of administrative leadership to daily practice. Understand, develop, and utilize theory and research in leadership to inform and improve practice. Analysis of macro and micro level forces impacting administrative leadership at the building and district level. Doctoral student status required.

ELP 780 Evaluation Theory and Practice in Education 3.
Review of educational program evaluation with emphasis on (1) theory and conceptual models of evaluation, (2) evaluation design, and (3) environmental practical factors influencing design and implementation of evaluation studies.

ELP 789 Personnel Recruitment, Selection, Development and Appraisal in Education 3.
Issues, models, theories, research and applications in the evolving field of educational personnel and human resources administration with emphasis on recruitment, selection, and development.

ELP 795 Special Topics 1-3.
Special Topics in Educational Research and Leadership.

ELP 820 Special Problems in Education 1-6.
Prerequisite: Graduate standing or PBS status.
Opportunity for graduate students in education to study problem areas in professional education under direction of member of graduate faculty.

Prerequisite: Nine hrs. in grad.-level courses.
Utilization of participant-observer role and required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Required development of possible alternative courses of action in various situations, selection of one of alternatives and evaluation of consequences of selected course of action.

ELP 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ELP 890 Doctoral Preliminary Exam 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

ELP 891 Problems Of Research Design In Education 1-3.
Prerequisite: ELP 742.
Provision of individualized but structured investigation of alternative problem definitions, research methodologies and statistical analyses for a problem of student's choosing, usually associated with thesis or dissertation. In small groups or individually with instructor, student consideration of research design, measurements and statistical analysis necessary to conduct research.

ELP 892 Research Projects In Educational Leadership and Program Evaluation 1-3.
A project or problem in research in education for graduate students, supervised by members of graduate faculty. Research chosen on basis of individual students’ interests and not to be part of thesis or dissertation research.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

ELP 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Education (ED)
ED - Education Courses

ED 100 Intro to Education 1.
This course serves as an introduction to teaching and learning in 21st century K-12 classrooms and as an orientation to the College and University experience. Through technology-assisted plenary and small group seminars, students will examine the knowledge, skills, and dispositions necessary to become globally aware, ethical, reflective teachers of diverse populations in the 21st century. Topics include academic skills, student success strategies, standards for teachers, and programs in the College of Education. This course is restricted to Teacher Education majors only.

ED 101 Freshman Teaching Fellows Forum I 1.
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education. Restricted to Students Admitted to the Teaching Fellows Program.

ED 150 Students Advocating for Youth I 1.
Building upon a passion for advocacy. Investigating issues related to youth in today's North Carolina. Exploring youth advocacy and ethics. Exploring youth advocacy and diversity. Exploring youth advocacy as a vocation. Practical youth advocacy field work. Participation in field experiences required. Restricted to students admitted to the SAY program.

ED 151 Students Advocating for Youth II 1.
Prerequisite: ED 150.
Continuing to build upon a passion for advocacy. Understanding how legislation and policy affects youth advocacy and youth organizations. Exploring changes within the career field. Exploring peer influence processes among youth. Practical youth advocacy field work. Participation in field experiences required. Field experience may extend beyond normal class time. Restricted to students admitted to the SAY program.

ED 201 Sophomore Teaching Fellows Forum I 1.
Prerequisite: Students in Teaching Fellows Program.
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education.

ED 204 Introduction to 21st Century Teaching 2.
Prerequisite: Sophomore standing; Corequisite: ECI 204 or EMS 204, or EMS 205, or TDE 202.
Overview of teaching as work and a profession in the 21st century. Course focuses on establishing a respectful environment for a diverse student population, dispositions and practices required for effective teaching, and processes and outcomes of collaborative lesson study. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

ED 296 Special Topics in Education 1-3.
Individual or group study of particular areas of education at the freshman and sophomore levels. Specific topics will vary from semester to semester.

ED 299 Field Experience for 21st Century Teaching I.
Prerequisite: ECI 204 and ED 204.
This course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Foreign Language Education majors.

ED 301 Junior Teaching Fellows Forum I 1.
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education. Restricted to Students Admitted to the Teaching Fellows Program.

ED 302 Junior Teaching Fellows Forum II 1.
Topics related to educational issues and requirements of the Teaching Fellows program. Topics will include current practices, policies and research in education. Restricted to Students Admitted to the Teaching Fellows Program.

ED 311 Classroom Assessment Principles and Practices 2.
Prerequisites: Admission to Teacher Education Candidacy (gpa 2.75) and (AEE 206 or ELM 250 or ED 204); Co-requisite: ED 312.
This course will enable students to understand and use appropriate classroom assessment practices to promote positive student achievement. Students will apply knowledge of pedagogy and development to high-quality strategies for formative and summative assessment. Students will explore best practices using developmentally-appropriate assessment strategies, including authentic assessment, portfolios and electronic portfolios, real-time feedback, open-and-closed-ended formal assessments, and standardized testing. Particular attention to examining the rationale for assessment and the implications of assessment. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

ED 312 Classroom Assessment Principles and Practices Professional Learning Lab 1.
Prerequisite: Admission to Teacher Education Candidacy (gpa 2.75) and ED 204; Co-requisite: ED 311.
This class is a co-requisite professional learning lab to ED 311, Classroom Assessment Principles and Practices. It will enable students to engage in the application of assessments using both case study and classroom data sets. The course will help students understand and use appropriate formative and summative classroom assessment in a learning community/learning team to improve student learning.
Students will explore best practices in assessment through the guidance of professional educators and the use of commercially available products for formative and summative assessment. The course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Teacher Education majors.

ED 403 Teaching Fellows Senior Seminar 1.
Prerequisite: Senior standing.
A casebook study of first-year teacher experiences and an examination of professional, ethical, and legal issues in education as found in cases dealing with new teachers.
ED 496 Special Topics in Education 1-3.
Prerequisite: Junior standing or Senior standing.
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

ED 507 Principles of Developing and Interpreting Assessment 2
Designed to enable students to understand and use appropriate classroom assessment practices by applying knowledge of pedagogy and development to high-quality strategies for formative and summative assessment. Students will explore best practices using developmentally-appropriate assessment strategies including authentic assessment, portfolios, and electronic portfolios, real-time feedback, open-and closed-ended formal assessments, and standardized testing. Particular attention will be paid to examining the rationale for assessment, and the implications of assessment.

ED 508 Exploring Diversity in Classroom and Community 3
Students will explore and apply the major philosophical and historical influences to current educational context as they relate to issues of diversity. Focus will be placed on theoretical and practical issues of diversity in classroom settings, especially related to culture, race, gender, ethnicity, language, and socio-economic levels. (Field-based experiences will be required).

ED 569 Teaching Internship: MAT 4
A supervised teaching experience requiring a minimum of 10 consecutive full-time weeks in an appropriate school classroom. Designed to develop the knowledge, skills, and dispositions necessary for teaching at the elementary, middle and/or secondary level. Includes regularly scheduled clinical observations and conferences. Requires successful completion of at least 21 hrs. in the MAT program and approval by specialty area faculty. Student responsible for transportation to placement site.

ED 570 Classroom Action Research 1
Provides a brief introduction to educational research focusing specifically on classroom action research. Requires admission to MAT; completion of 6 hours in the program.

ED 571 Inquiry and Professional Development 1
Builds on earlier course work (ED 570) preparing students to refine an action research proposal, collect data in a school setting, write a report, and to identify resources and activities that will support their ongoing professional development; requires 9 hours of graduate credit in the MAT curriculum.

ED 572 Teacher Leadership 1
This course explores the multiple contexts, roles, and approaches to teacher leadership in classrooms, schools, communities, and professional organizations. Requires at least 30 credit hours in the MAT program.

ED 590 Special Problems in Teaching and Learning 1-6.
In-depth study of topical problems in teaching and learning of current and special interest to K-12 Classroom teachers.

ED 605 Special Problems in Teaching 1-3.
Prerequisite: Graduate standing.
In-depth study of topical problems in teaching selected from areas of current concern to K-12 teachers.

ED 700 Introduction to Research Design in Education 3.
Survey of the field of educational research specifically with regard to the modes of inquiry, variety of methodologies, and ethical standards for conducting research with human participants. Limited to doctoral students in Education or by permission of instructor.

ED 710 Applied Quantitative Methods in Education I 3.
Prerequisite: ED 700, or ECI 510, or ELP 532, or ST 507.
This course is designed for educational researchers and leaders to gain experience with designing and evaluating research using a quantitative approach to answer research questions in educational research and policy analysis. Students will examine design issues in research, create data sets, develop research questions from data provided, use a variety of descriptive and inferential procedures to answer formulated research questions, interpret the results and write the results in the language of educational research. Restricted to doctoral students in Education or by permission of instructor.

ED 711 Applied Quantitative Methods in Education II 3.
Prerequisite: ED 710.
Students will apply and enhance their quantitative skills through analysis of existing datasets. Course goals include practicing and extending Multiple Regression knowledge and skills, generating and testing hypotheses in a multiple regression framework, and appropriately disseminating results. Restricted to doctoral students in Education Research only.

Prerequisite: ED 710.
Introduces students to the skills and resources needed to design and conduct a survey in educational settings. Students who take this course will be able to identify and develop specific survey objectives, design survey studies, sample respondents, develop reliable and valid self-administered questionnaires, administer surveys, and process data.

ED 730 Introduction to Qualitative Research and Data Analysis in Education 3.
Design of qualitative studies, conduct of field work including open-ended interviews and participant observation, analysis of data and understanding of theoretical and philosophical background of this research approach.

ED 731 Advanced Qualitative Research and Data Analysis in Education 3.
Prerequisite: ELP 736, EAC 785 or ED 730.
Intensive course in the use of field-based and general qualitative research data analysis methods in the social study of education. The course is to help participants acquire skills and gain experience in using various methodological and analytical research techniques. The course emphasis is on the collection, management, analysis, and interpretation of qualitative data.

ED 750 Mixed Methods Research in Education 3.
Prerequisite:ED 711,ED 730,ST 507, EL736 or equivalent and/or permission of the instructor.
Explores the theoretical and practical issues surrounding the combining of quantitative and qualitative methods in educational research studies. It addresses how to design, implement and write-up mixed methods research as well as how to critically review and interpret mixed methods research studies.

ED 795 Special Topics in Education Research 3-6.
This course provides in-depth instruction and applications in new or emerging areas of educational research, studies or venues. May be repeated for credit if topic changes. Doctoral students in education only.

Educational Psychology (EDP)
EDP - Educational Psychology Courses

EDP 304 Educational Psychology 3.
Prerequisite: Sophomore standing.
Psychological principles applied to education, including cognitive and personality development, individual differences, learning and behavior theory, cognitive strategies for learning and remembering, critical thinking and problem-solving strategies, student motivation, classroom management techniques, components of teacher effectiveness, measurement and student evaluation procedures, characteristics of exceptional children, mainstreaming in the classroom, and multicultural education.

EDP 370 Applied Child Development 3.
Prerequisite: Sophomore standing.
Students will explore how biological, cognitive, and social/emotional development affects children's learning and behavior. The course will focus on applying important theories and current findings in development to issues in education such as lesson planning, curriculum design, behavior management, motivation, an appropriate assessment. Students will also apply knowledge of development to issues such as creating actively engaging individuated experiences to deal with gifted students, students with diverse ethnic or cultural backgrounds, and students with exceptionalities or disabilities.

EDP 476 Psychology of Adolescent Development 3.
Prerequisite: PSY 200 or EDP 304.
Theories, principles, and issues of human psychological development emphasizing adolescence. Cognitive, social, and physical changes; their interaction. Implications for teaching and parenting adolescents.

EDP 504 Advanced Educational Psychology 3.
Prerequisite: Graduate standing.
A critical appraisal of current psychological findings relevant to educational practice and theory.

Prerequisite: Graduate standing.
The study of principles of educational testing and measurement, particularly classroom assessment, including norm and criterion referenced assessment, classroom testing methods and principles, standardized testing and measurement, item analysis, and an introduction to basic descriptive statistics. A brief introduction to innovative assessment is also included.

EDP 575 Multicultural Lifespan Development 3.
This course surveys theories, principles, and issues of psychological development throughout the lifespan. Emphasis will be placed on understanding current developmental research and its application to the enhancement of development from birth to late adulthood. Implications for helping professionals working in multicultural contexts will be provided.

EDP 582 Adolescent Development 3.
Prerequisite: 6 hours in PSY.
Current theories and research on development during adolescence. Topics include: physical growth, cognitive changes, relationships with peers, parents and teachers, quest for identity and independence, morality and sexuality.

EDP 590 Special Problems in Educational Psychology 1-6.
In-depth study of topical problems in cognition, motivation, assessment, or other educational psychology area of current and special interest to educators.

EDP 605 Special Problems in Educational Psychology 1-6.
In-depth study of topical problems in educational psychology selected from areas of current concern to educators.

EDP 696 Summer Thesis Res 1.

EDP 704 Theories and Research in Educational Psychology 3.
Doctoral students only (DR).
Review and synthesis of pertinent literature in specialized topics and areas of research in educational psychology. Topic selection will vary by semester and instructor. Graduate standing or permission of instructor.

EDP 723 Motivation in Education 3.
P: ED 700 or equivalent.
The purpose of this course is to inform students about motivation theories and how various concepts from these theories are related to education practice. The course components are designed to provide students with an understanding of research in motivation, as well as the relationships between theoretical perspectives of human motivation and the teaching practice.

EDP 750 Mixed Methods Research in Education 3.
Prerequisite: ED 711, ED 730, ST 507, ELP 736 or equivalent and/or permission of the instructor.
Explores the theoretical and practical issues surrounding the combining of quantitative and qualitative methods in educational research studies. It addresses how to design, implement and write-up mixed methods research as well as how to critically review and interpret mixed methods research studies.

EDP 896 Summer Dissertation Res 1.

Electrical and Computer Engineering (ECE)

ECE - Electrical and Computer Engineering Courses

ECE 109 Introduction to Computer Systems 3.
Introduction to key concepts in computer systems. Number representations, switching circuits, logic design, microprocessor design, assembly language programming, input/output, interrupts and traps.

ECE 200 Introduction to Signals, Circuits and Systems 4.
Prerequisite: Cum GPA 2.5 or above (or NTR), C or better in MA 241 and PY 205.
Ohm's law and Kirchhoff's laws; circuits with resistors, photocells, diodes and LEDs; rectifier circuits; first order RC circuits; periodic signals in time and frequency domains, instantaneous, real and apparent power; DC and RMS value; magnitude and power spectra, dB, dBW, operational amplifier circuits, analog signal processing systems including amplification, clipping, filtering, addition, multiplication, AM modulation sampling and reconstruction. Weekly hardware laboratory utilizing multimeter, function generator, oscilloscope and spectrum analyzer and custom hardware for experiments on various circuits and systems.

ECE 209 Computer Systems Programming 3.
Prerequisite: Grade of C- or better in ECE 109.
Computer systems programming using the C language. Translation of C into assembly language. Introduction to fundamental data structures: array, list, tree, hash table.
ECE 211 Electric Circuits 4.
Prerequisite: C- or better in ECE 200 and Corequisite: ECE 220.
Introduction to theory, analysis and design of electric circuits. Voltage, current, power, energy, resistance, capacitance, inductance. Kirchhoff's laws node analysis, mesh analysis, Thévenin's theorem, Norton's theorem, steady state and transient analysis, AC, DC, phasors, operational amplifiers, transfer functions.

ECE 212 Fundamentals of Logic Design 3.
Prerequisite: C- or better in ECE 109.
Introduction to digital logic design. Boolean algebra, switching functions, Karnaugh maps, modular combinational circuit design, latches, flip-flops, finite state machines, synchronous sequential circuit design, datapaths, memory technologies, caches, and memory hierarchies. Use of several CAD tools for simulation, logic minimization, synthesis, state assignment, and technology mapping.

ECE 220 Analytical Foundations of Electrical and Computer Engineering 3.
Prerequisite: C- or better in ECE 200.
This course is designed to acquaint you with the basic mathematical tools used in electrical and computer engineering. The concepts covered in this course will be used in higher level courses and, more importantly, throughout your career as an engineer. Major topics of the course include complex numbers, real and complex functions, signal representation, elementary matrix algebra, solutions to linear systems of equations, linear differential equations, laplace transforms used for solving linear differential equations, fourier series and transforms and their uses in solving ECE problems. EE and CPE Majors Only.

ECE 301 Linear Systems 3.
Prerequisite: C- or better in ECE 211 and ECE 220.

ECE 302 Microelectronics 4.
Prerequisite: A grade of C- or better in ECE 211.
Introduction to the physics of semiconductors, PN Junctions, BJT and MOS field Effect Transistors: Physics of operation, IV characteristics, load line, quiescent point of operation, PSPICE analysis; diode circuit analysis; voltage regulation; Single Stage Transistor Amplifiers: Common Emitter and Common Source configurations, biasing, inverting and non-inverting amplifiers; follower circuits; calculation of small signal voltage gain, current gain, coupling and bypass capacitors; Multistage ac-coupled amplifiers; small signal modeling; input resistance and output resistance; logic inverters.

ECE 303 Electromagnetic Fields 3.
Prerequisite: A grade of C- or better in ECE 211 and ECE 220.
This course prepared the students to formulate and solve electromagnetic problems relevant to all fields of electrical and computer engineering and that will find application in subsequent courses in RF circuits, photonics, microwaves, wireless networks, computers, bioengineering, and nanoelectronics. Primary topics include static electric and magnetic fields, Maxwell's equations and force laws, wave propagation, reflection and refraction of plane waves, transient and steady-state behavior of waves on transmission lines. Restriction: EE and CPE Majors Only.

ECE 305 Principles of Electromechanical Energy Conversion 3.
Prerequisite: C- or better in ECE 211 or ECE 331.
Three-phase circuits and power flow, analysis of magnetic circuits, performance of single-phase and three-phase transformers, principles of electromechanical energy conversion, steady-state characteristics and performance of alternating current and direct current machinery.

ECE 306 Introduction to Embedded Systems 3.
Prerequisite: C- or better in ECE 209 and ECE 212.
Introduction to designing microcontroller-based embedded computer systems using assembly and C programs to control input/output peripherals. Use of embedded operating system.

ECE 308 Elements of Control Systems 3.
Prerequisite: (ECE 220 and ECE 211) or BME 311; Co-requisite: ECE 301.
Analog system dynamics, open and closed loop control, block diagrams and signal flow graphs, input-output relationships, stability analyses using Routh-Hurwitz, root-locus and Nyquists, time and frequency domain analysis and design of analog control systems. Use of computer-aided analysis and design tools. Class project. EE, CPE, BME majors only.

ECE 309 Object-Oriented Programming for Electrical and Computer Engineers 3.
Prerequisite: C- or better in ECE 209.

ECE 310 Design of Complex Digital Systems 3.
Prerequisite: A grade of C- or better in ECE 212.

ECE 331 Principles of Electrical Engineering 3.
Prerequisite: PY 208 and a C or better in MA 241.
Concepts, units and methods of analysis in electrical engineering. Analysis of d-c and a-c circuits, characteristics of linear and non-linear electrical devices; principles of operational amplifiers; transformers; motors; and filters.

ECE 380 Engineering Profession for Electrical Engineers 1.
Prerequisites: C- or better in ECE 211 and ECE 212 and ECE 220.
Introduction to engineering as a profession including issues surrounding electrical engineering. Topics include professional and ethical responsibilities, risks and liabilities, intellectual property, and privacy. Economic issues including entrepreneurship and globalization.

ECE 381 Engineering Profession for Computer Engineers 1.
Prerequisites: C- or better in ECE 211 and ECE 212 and ECE 220.
Introduction to engineering as a profession including issues surrounding computer engineering. Topics include professional and ethical responsibilities, risks and liabilities, intellectual property, and privacy. Economic issues including entrepreneurship and globalization.
ECE 383 Introduction to Entrepreneurship and New Product Development 3.
This course is part of the Engineering Entrepreneurs Program. Students work as team members on projects being led by seniors completing their senior capstone design. Students will be exposed to many areas of product development and will assist in the design and implementation of the prototype product.

ECE 402 Communications Engineering 3.
P: ECE 301 and ST 371; R: EE and CPE Majors Only.
An overview of digital communications for wireline and wireless channels which focuses on reliable data transmission in the presence of bandwidth constraints and noise. The emphasis is on the unifying principles common to all communications systems, examples include digital telephony, compact discs, high-speed modems and satellite communications.

ECE 403 Electronics Engineering 3.
Prerequisite: ECE 301, ECE 302.
Design and analysis of CMOS integrated circuits, from single transistor stages to operational amplifiers. Feedback in operational amplifier circuits, compensation and stability. ECE majors only.

ECE 404 Introduction to Solid-State Devices 3.
P: ECE 302 or E 304; C: EE, CPE, NanoScience and Technology Majors Only.
Basic principles required to understand the operation of solid-state devices. Semiconductor device equations developed from fundamental concepts. P-N junction theory developed and applied to the analysis of devices such as varactors, detectors, solar cells, bipolar transistors, field-effect transistors. Emphasis on device physics rather than circuit applications.

ECE 407 Introduction to Computer Networking 3.
Prerequisite: ECE 301.
This course focuses on engineering principles of computer communications and networking, including layering concepts, overview of protocols, architectures for local, metropolitan, and wide-area networks, routing protocols, internet operations, transport control and applications, emerging issues in computer networks. EE and CPE majors only.

ECE 420 Wireless Communication Systems 3.
Prerequisite: ECE 402.
A study of applications of communication theory and signal processing to wireless systems. Topics include an introduction to information theory and coding, basics and channel models for wireless communications, and some important wireless communication techniques including spread-spectrum and OFDM. MATLAB exercises expose students to engineering considerations.

ECE 421 Introduction to Signal Processing 3.
Prerequisite: ECE 301.

ECE 422 Transmission Lines and Antennas for Wireless 3.
Prerequisite: ECE 303.
Review of time-varying electromagnetic theory. A study of the analytical techniques and the characteristics of several useful transmission lines and antennas. Examples are coaxial lines, waveguides, microstrip, optical fibers and dipole, monopole and array antennas.

ECE 423 Introduction to Photonics and Optical Communications 3.
Prerequisite: ECE 303 or Permission of the Instructor.
This course investigates photonic devices at the component level and examines the generation, propagation, and detection of light in the context of optical communication systems. Topics include the design of simple optical systems and focuses on the use of lasers, fiber optics, and photodetectors. The labs include building a Michelson interferometer, preparing and coupling light to an optical fiber, characterizing LEDs and laser diodes and making a fiber optical link.

ECE 434 Fundamentals of Power Electronics 3.
Prerequisite: ECE 302 or equivalent.
Design, analysis, modeling and control of DC-DC converters, DC-AC inverters, AC-DC rectifiers/converters, and AC-to-AC converters. Power conversion using switched high-voltage high-current semiconductors in combination with inductors and capacitors. Design of DC-DC, DC-AC, AC-DC, and AC-AC power converters as well as an introductions to design of magnetic components for use in power converters, applications to fuel cells, photovoltaics, motor drives, and uninterruptable power supplies.

ECE 436 Digital Control Systems 3.
Prerequisite: ECE 435.
Discrete systems dynamics, sampled-data systems, mathematical representations of analog/digital and digital/analog conversions, open- and closed-loop systems, input-output relationships, state-space and stability analyses, time- and frequency-domain analyses. Design and implementation of digital controllers.

ECE 442 Integrated Circuit Technology and Fabrication 3.
Prerequisite: ECE 404.
Semiconductor device and integrated-circuit processing and technology. Wafer specification and preparation, oxidation, diffusion, ion implantation, photolithography, design rules and measurement techniques.

ECE 451 Power System Analysis 3.
Prerequisite: ECE 305.
Long-distance transmission of electric power with emphasis on load flow, economic dispatch, fault calculations and system stability. Applications of digital computers to power-system problems. Major design project.

Prerequisite: ECE 305 or ECE 331.
Principles and characteristics of renewable energy based electric power generation technologies such as photovoltaic systems, wind turbines, and fuel cells. Main system design issues. Integration of these energy sources into the power grid. Economics of distributed generation. Credit is not allowed for both ECE 452 and ECE 552.

ECE 453 Electric Motor Drives 3.
Prerequisite: A grade of C or better in ECE 305.
Principles of electromechanical energy conversion; analysis, modeling, and control of electric machinery; steady state performance characteristics of direct-current, induction, synchronous and reluctance machines; scalar control of induction machines; introduction to direct- and quadrature-axis theory; dynamic models of induction and synchronous motors; vector control of induction and synchronous motors.

ECE 455 Industrial Robotic Systems 3.
Prerequisite: ECE 308.
Techniques of computer control of industrial robots: interfacing with synchronous hardware including analog/digital and digital/analog converters, interfacing noise problems, control of electric and hydraulic actuators, kinematics and kinetics of robots, path control, force control, sensing including vision. Major design project. EE, CPE, BME, JEM majors only.
ECE 456 Mechatronics 3.
Prerequisite: ECE 435.
The study of electro-mechanical systems controlled by microcomputer technology. The theory, design and construction of smart systems; closely coupled and fully integrated products and systems. The synergistic integration of mechanisms, materials, sensors, interfaces, actuators, microcomputers, controllers, and information technology.

ECE 461 Embedded System Design 3.
Prerequisite: Grade of C- or better in ECE 306.
Design and implementation of software for embedded computer systems. The students will learn to design systems using microcontrollers, C and assembly programming, real-time methods, computer architecture, interfacing system development and communication networks. System performance is measured in terms of power consumption, speed and reliability. Efficient methods for project development and testing are emphasized. Credit will not be awarded for both ECE 461 and ECE 561. Restricted to CPE and EE Majors.

ECE 463 Advanced Microprocessor Systems Design 3.
Prerequisite: ECE 406.
Advanced topics in microprocessor systems design, including processor architectures, virtual-memory systems, multiprocessor systems, and single-chip microcomputers. Architectural examples include a variety of processors of current interest, both commercial and experimental. Major design project.

ECE 464 ASIC Design 3.
Prerequisite: ECE 406, ECE 302.
Design of digital application specific integrated circuits (ASICs) based on hardware description languages (Verilog, VHDL) and CAD tools. Emphasis on design practices and underlying algorithms. Introduction to deep sub-micron design issues like interconnections and low power and to modern applications including multi-media, wireless. Telecommunications and computing. Required design project.

ECE 466 Compiler Optimization and Scheduling 3.
Prerequisite: ECE 306 and either ECE 309 or CSC 316.
Provide insight into current compiler designs dealing with present and future generations of high performance processors and embedded systems. Investigate dataflow analysis and memory disambiguation, classical and parallelism enhancing optimizations, scheduling and speculative execution, and register allocation. Review of techniques used in current research compilers.

ECE 468 Conventional and Emerging Nanomanufacturing Techniques and Their Applications in Nanosystems 3.
Prerequisite: E 304.
Conventional and emerging nano-manufacturing techniques and their applications in the fabrication of various structures and devices. Review of techniques for patterning, deposition, and etching of thin films including emerging techniques such as an imprint and soft lithography and other unconventional techniques. Electronic and mechanical properties of 0 to 3-D nanostructures and their applications in nano-electronics, MEMS/ NEMS devices, sensing, energy harvesting, storage, flexible electronics and nano-medicine. Credit for both ECE/CHE 468 and ECE/CHE 568 is not allowed.

ECE 470 Internetworking 3.
Prerequisite: ECE 407 or CSC 401.
Introduction, Planning and Managing networking projects, networking elements-hardware, software, protocols, applications; TCP/IP, ATM, LAN emulation. Design and implementation of networks, measuring and assuring network and application performance, metrics, tools, quality of service. Network-based applications, Network management and security.

ECE 480 Senior Design Project in Electrical Engineering 3.
Prerequisite: ECE 301, ECE 302, ECE 303, ECE 380, and any two ECE specialization Courses.
Applications of engineering and basic sciences to the total design of electrical engineering circuits and systems. Consideration of the design process including feasibility study, preliminary design detail, cost effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Complete written and oral engineering report required.

ECE 481 Senior Design Project in Computer Engineering 3.
Prerequisite: ECE 381, ECE 301, ECE 302, ECE 303, ECE 406 and an ECE specialization elective.
Application of engineering and basic sciences to the total design of computer engineering circuits and systems. Consideration of the design process including feasibility study, preliminary design detail, cost effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Complete written and oral engineering report required.

ECE 482 Engineering Entrepreneurship and New Product Development I 3.
Applications of engineering, mathematics, basic sciences, finance, and business to the design and development of prototype engineering products. This course requires a complete written report and an end-of-course presentation. This is the first course in a two semester sequence. Students taking this course will implement their designed prototype in ECE 483: Senior Design Project in Electrical Engineering and Computer Engineering II-Engineering Entrepreneurs. Departmental approval required.

ECE 483 Engineering Entrepreneurship and New Product Development II 3.
Prerequisite: ECE 301, ECE 302, ECE 303, and any two ECE specialization courses.
Applications of engineering, science, management and entrepreneurship to the design, development and prototyping of new product ideas. Based on their own new product ideas, or those of others, students form and lead entrepreneurship teams (eTeams) to prototype these ideas. The students run their eTeams as ‘virtual’ startup companies where the seniors take on the executive roles. Joining them are students from other grade levels and disciplines throughout the university that agree to participate as eTeam members. Departmental approval required.

ECE 484 Electrical and Computer Engineering Senior Design Project I 3.
Prerequisite: ECE 380 and ECE 301 and ECE 302 and ENG 331; Coreq: One 400-level ECE Elective.
Applications of engineering and basic sciences to the total design of electrical and/or computer engineering circuits and systems. Consideration of the design process including concept and feasibility study, systems design, detailed design, project management, cost effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Supported with introduction to a parallel functions impacting engineering design process to including: industrial design, finance, operations, etc. EE and CPE Majors only.

ECE 485 Electrical and Computer Engineering Senior Design Project II 3.
Prerequisite: ECE 380 and ECE 301 and ECE 302 and ENG 331; Coreq: One 400-level ECE Elective.
Applications of engineering and basic sciences to the total design of electrical and/or computer engineering circuits and systems. Consideration of the design process including concept and feasibility study, systems design, detailed design, project management, cost effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Supported with introduction to a parallel functions impacting engineering design process to including: industrial design, finance, operations, etc. EE and CPE Majors only.
ECE 485 Electrical and Computer Engineering Senior Design Project 3.
Prerequisite: ECE 484.
Applications of engineering and basic sciences to the total design of electrical engineering circuits and systems. Consideration of the design process including feasibility study, preliminary design detail, cost effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Complete written and oral engineering report required. EE and CPE majors only.

ECE 492 Special Topics in Electrical and Computer Engineering 1-4.
Offered as needed for development of new courses in electrical and computer engineering.

ECE 495 Individual Study in ECE 1-3.
P: Appropriate 300-level Course; R: EE and CPE Majors Only. Department Approval Required.
Independent investigation of a topic or research problem under faculty supervision. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ECE 498 Special Projects in ECE 1-3.
Prerequisite: At least one 300-level ECE course, 3.0 GPA; Restricted to: EE or CPE majors.
Faculty-supervised special projects in electrical and/or computer engineering. Projects involve small groups of students, working collaboratively or independently, focused on a single theme, such as the design of a component or system. Requires a "Course Agreement for Students Enrolled in Non-Standard Courses," completed by the student and faculty member prior to registration by the department.

ECE 506 Architecture Of Parallel Computers 3.
Prerequisite: ECE 406.

ECE 511 Analog Electronics 3.
Prerequisite: ECE403.
Analog integrated circuits and analog integrated circuit design techniques. Review of basic device and technology issues. Comprehensive coverage of MOS and Bipolar operational amplifiers. Brief coverage of analog-to-digital conversion techniques and switched-capacitor filters. Strong emphasis on use of computer modeling and simulation as design tool. Students required to complete an independent design project.

ECE 513 Digital Signal Processing 3.
Prerequisite: ECE 421, B average in ECE and MA; Signals and Linear Systems.
Digital processing of analog signals. Offline and real-time processing for parameter, waveshape and spectrum estimation. Digital filtering and applications in speech, sonar, radar, data processing and two-dimensional filtering and image processing.

ECE 514 Random Processes 3.
Prerequisite: Statistics 371; Signals and Linear Systems; Linear Algebra; Calculus.
Probabilistic descriptions of signals and noise, including joint, marginal and conditional densities, autocorrelation, cross-correlation and power spectral density. Linear and nonlinear transformations. Linear least-squares estimation. Signal detection.

ECE 515 Digital Communications 3.
Prerequisite: ECE 514, ST 371, Signals and Linear Systems; Linear Algebra.
This course is a first graduate-level course in digital communications. Functions and interdependence of various components of digital communication systems will be discussed. Statistical channel modeling, modulation and demodulation techniques, optimal receiver design, performance analysis methods, source coding, quantization, and fundamentals of information theory will be covered in this course.

ECE 516 System Control Engineering 3.
Prerequisite: ECE 435 or ECE 301.
Introduction to analysis and design of continuous and discrete-time dynamical control systems. Emphasis on linear, single-input, single-output systems using state variable and transfer function methods. Open and closed-loop representation; analog and digital simulation; time and frequency response; stability by Routh-Hurwitz, Nyquist and Liapunov methods; performance specifications; cascade and state variable compensation. Assignments utilize computer-aided analysis and design programs.

ECE 517 Object-Oriented Design and Development 3.
Prerequisite: CSC 326 or ECE 309.
The design of object-oriented systems, using principles such as the GRASP principles, and methodologies such as CRC cards and the Unified Modeling Language (UML). Requirements analysis. Design patterns Agile Methods. Static vs. dynamic typing. Metaprogramming. Open-source development practices and tools. Test-first development. Project required, involving contributions to an open-source software project.

ECE 520 Digital Asic Design 3.
Prerequisite: ECE 212 and Senior or Graduate standing.
Design of digital Application Specific Integrated Circuits (ASICs) based on Hardware Description Languages (Verilog, VHDL) and CAD tools, particularly login synthesis. Emphasis on design practices and underlying algorithms. Introduction to timing-driven design, low-power design, design-for-test and ASIC applications. Project.

ECE 521 Computer Design and Technology 3.
Prerequisite: ECE 306.
Design of general-purpose computers through cost-performance analysis. Emphasis on making design decisions regarding the instruction set architecture and organization of single-processor computer. Discussion of design choices, role of compiler and techniques for analysis, simulation and implementation. Consideration of relationships between architecture, organization and technology.

ECE 522 Medical Instrumentation 3.
Fundamentals of medical instrumentation systems, sensors, and biomedical signal processing. Example instruments for cardiovascular and respiratory assessment. Clinical laboratory measurements, therapeutic and prosthetic devices, and electrical safety requirements. Students should have background in electronics design using operational amplifiers.
ECE 538 Integrated Circuits Technology and Fabrication 3. 
Prerequisite: ECE 404.

ECE 540 Electromagnetic Fields 3.
Prerequisite: ECE 422.
Brief review of Maxwell's Equations, constitutive relations and boundary conditions. Reflection and refraction of plane waves; power and energy relations in isotropic media. Potential functions, Green's functions and their applications to radiation and scattering. Antenna fundamentals: linear antennas, uniform linear arrays and aperture antennas, microstrip antennas. Fundamentals of numerical methods for electromagnetic simulation and antenna design.

ECE 544 Design Of Electronic Packaging and Interconnects 3.
Prerequisite: ECE 302.
Introduction to neural networks and other basic machine learning methods including radial basis functions, kernel methods, support vector machines. The course introduces regularization theory and principle component analysis. The relationships to filtering, pattern recognition and estimation theory are emphasized.

ECE 547 Cloud Computing Technology 3.
Prerequisites: CSC 501 and ECE/CSC 570.
Study of cloud computing principles, architectures, and actual implementations. Students will learn how to critically evaluate cloud solutions, how to construct and secure a private cloud computing environment based on open source solutions, and how to federate it with external clouds. Performance, security, cost, usability, and utility of cloud computing solutions will be studied both theoretically and in hands-on exercises. Hardware-, infrastructure-, platform-, software-, security-, and high-performance computing - "as-a-service".

ECE 549 RF Design for Wireless 3.
Prerequisite: ECE 303, ECE 302.
Design of the hardware aspects of wireless systems with principle emphasis on design of radio frequency (RF) and microwave circuitry. Introduction of system concepts then functional block design of a wireless system. RF and microwave transistors, noise, power amplifiers, CAE, linearization and antennas.
ECE 550 Power System Operation and Control 3.
Prerequisite: ECE 305, ECE 435.
Fundamental concepts of economic operation and control of power systems. Real and reactive power balance. System components, characteristics and operation. Steady state and dynamic analysis of interconnected systems. Tieline power and load-frequency control with integrated economic dispatch.

ECE 551 Smart Electric Power Distribution Systems 3.
Prerequisite: ECE 451.
Features and components of electric power distribution systems, power flow, short circuit and reliability analysis, basic control and protection, communications and SCADA, new "smart" functionality such as integrated volt/Var control, automated fault location isolation and restoration, demand response and advanced metering infrastructure, integration of distributed generation and energy storage.

Prerequisite: ECE 305 or ECE 331.
Principles and characteristics of renewable energy based electric power generation technologies such as photovoltaic systems, wind turbines, and fuel cells. Main system design issues. Integration of these energy sources into the power grid. Economics of distributed generation. Credit is not allowed for both ECE 452 and ECE 552.

ECE 553 Semiconductor Power Devices 3.
Prerequisite: ECE 404.
The operational physics and design concepts for power semiconductor devices. Relevant transport properties of semiconductors. Design of breakdown voltage and edge terminations. Analysis of Schottky rectifiers, P-i-N rectifiers, Power MOSFETs, Bipolar Transistors, Thyristors and Insulated Gate Bipolar Transistors.

ECE 555 Computer Control of Robots 3.
Prerequisite: ECE 435; ECE 436; ECE 456.
An introduction to robotics: history and background, design, industrial applications and usage. Manipulator sensors, actuators and control, linear, non-linear, and force control. Manipulator kinematics: position and orientation, frame assignment, transformations, forward and inverse kinematics. Jacobian: velocities and static forces. Manipulator Kinetics: velocity, acceleration, force, Trajectory generation. Programming languages: manipulator level, task level, and object level. Introduction to advanced robotics. Credit not allowed for both ECE 455 and 555.

ECE 556 Agent-based Mechatronics Systems 3.
Prerequisite: ECE 301.
Agent and systems concepts to study sensors, actuators, controllers and communication networks, as well as their interactions. Theory, design and control of the integration of sensors, interfaces, actuators, microcontrollers. Use of computer networks as communication media in the mechatronics systems integration and control. Use of unmanned vehicle path tracking and teleoperation to illustrate the mechatronics agent and system concept and integration. Students can either take ECE 456 or ECE 556, but not both. These two courses are piggy-backed and cover similar material, yet ECE 556 has more demanding homework, project, and an exam that are at the graduate level.

ECE 557 Principles Of MOS Transistors 3.
Prerequisite: ECE 404.
MOS capacitor and transistor regions of operation. Depletion and enhancement mode MOSFETs. MOSFET scaling, short and narrow channel effects. MOSFETs with ion-implanted channels. High field effects in MOSFETs with emphasis on recent advances in design of hit carrier suppressed structures. Small and large signal MOSFET models. State of the art in MOS process integration.

ECE 558 Digital Imaging Systems 3.
Prerequisites: ECE 301 and ST 372.
Foundation for designing and using digital devices to accurately capture and display color images, spatial sampling, frequency analysis, quantization and noise characterization of images. Basics of color science are presented and applied to image capture and output devices.

ECE 561 Embedded System Design 3.
Prerequisite: ECE 306.
Design and implementation of embedded computer systems. The student will extend previous knowledge of the use of microcontrollers, C and assembly programming, real-time methods, computer architecture, simulation, interfacing, system development and communication networks. System performance is measured in terms of power consumption, speed and reliability. Efficient methods for project development and testing are emphasized.

ECE 566 Code Generation and Optimization 3.
Prerequisite: ECE 306 and CSC 316.
Provide insight into current compiler designs dealing with present and future generations of high performance processors and embedded systems. Investigate dataflow analysis and memory disambiguation, classical and parallelism enhancing optimizations, scheduling and speculative execution, and register allocation. Review of techniques used in current research compilers. Students may not take both 466 and 566 for credit.

ECE 568 Conventional and Emerging Nanomanufacturing Techniques and Their Applications in Nanosystems 3.
Prerequisite: Graduate Standing or Permission of the Instructor.
Conventional and emerging nano-manufacturing techniques and their applications in the fabrication of various structures and devices. Review of techniques for patterning, deposition, and etching of thin films including emerging techniques such as an imprint and soft lithography and other unconventional techniques. Electronic and mechanical properties of 0 to 3-D nanostructures and their applications in nano-electronics, MEMS/ NEMS devices, sensing, energy harvesting, storage, flexible electronics and nano-medicine. Credit for both ECE/CHE 468 and ECE/CHE 568 is not allowed.

ECE 570 Computer Networks 3.
Prerequisite: ECE 206 or CSC 312, ST 371, CSC 258 and Senior standing or Graduate standing.
General introduction to computer networks. Discussion of protocol principles, local area and wide area networking, OSI stack, TCP/IP and quality of service principles. Detailed discussion of topics in medium access control, error control coding, and flow control mechanisms. Introduction to networking simulation, security, wireless and optical networking.

ECE 573 Internet Protocols 3.
Prerequisite: CSC/ECE 570.
Principles and issues underlying provision of wide area connectivity through interconnection of autonomous networks. Internet architecture and protocols today and likely evolution in future. Case studies of particular protocols to demonstrate how fundamental principles applied in practice. Selected examples of networked client/server applications to motivate the functional requirements of internetworking. Project required.
ECE 574 Computer and Network Security 3.  
**Prerequisite:** (CSC 316) and (CSC 401 or CSC/ECE 570).  
Security policies, models, and mechanisms for secrecy, integrity, and availability. Basic cryptography and its applications; operating system models and mechanisms for mandatory and discretionary controls; introduction to database security; security in distributed systems; network security (firewalls, IPsec, and SSL); and control and prevention of viruses and other rogue programs.

ECE 575 Introduction to Wireless Networking 3.  
**Prerequisite:** ECE/CSC 570.  
Introduction to cellular communications, wireless local area networks, ad-hoc and IP infrastructures. Topics include: cellular networks, mobility management, connection admission control algorithms, mobility models, wireless IP networks, ad-hoc routing, sensor networks, quality of service, and wireless security.

**Prerequisite:** CSC/ECE 570.  
Topics related to networking services, signaling for setting up networking services, such as SIP and IMS, networking architectures for providing QoS for networking services, such as MPLS, DiffServ and RAC, signaling protocols for setting up QoS connections in the transport stratum, such as LDP and RSVP-TE, video-based communications, and capacity planning models for dimensioning services.

ECE 577 Switched Network Management 3.  
Topics related to design and management of campus enterprise networks, including VLAN design; virtualization and automation methodologies for management; laboratory use of open space source and commercial tools for managing such networks.

ECE 579 Introduction to Computer Performance Modeling 3.  
**Prerequisite:** CSC 312 and MA 421.  
Workload characterization, collection and analysis of performance data, instrumentation, tuning, analytic models including queuing network models and operational analysis, economic considerations.

ECE 581 Electric Power System Protection 3.  
**Prerequisite:** ECE 451.  
Protection systems used to protect the equipment in an electric power system against faults, fault analysis methods, basic switchgear used for protection, basic protection schemes, such as overcurrent, differential, and distance protection and their application.

ECE 582 Wireless Communication Systems 3.  
**Prerequisite:** Senior level digital communications course, e.g., ECE402, Corequisite: ECE 714.  
Theory and analysis of wireless portable communication systems. Provides a fundamental understanding of the unique characteristics of these systems. Topics include: Code Division Multiple Access (CDMA), mobile radio propagation, characterization of a Rayleigh fading multipath channel, diversity techniques, adaptive equalization, channel coding, and modulation/demodulation techniques. Although contemporary cellular and personal communication services (PCS) standards are covered, the course stresses fundamental theoretical concepts that are not tied to a particular standard.

ECE 583 Electric Power Engineering Practicum I 3.  
**Prerequisite:** ECE 451.  
This course introduces fundamentals of project management and system engineering principles in a wide range of electric power applications from concept through termination. The course also provides opportunities for students to adapt technical content to both expert and novice audiences in project management reports and presentations. Restricted to Master of Science in Electric Power Systems Engineering.

ECE 584 Electric Power Engineering Practicum II 3.  
**Prerequisite:** ECE 583.  
In this capstone course students will apply electric engineering and science knowledge to an electrical power engineering project. Consideration of the design process including feasibility study, preliminary design detail, cost effectiveness, along with development and evaluation of a prototype accomplished through design-team project activity. Complete written and oral engineering report required. Restricted to Master of Science in Electric Power Systems Engineering.

**Prerequisite:** ECE 451.  
Evolution of the electric utility industry, the structure and business models of the industry, the regulatory factors within which the utilities operate, the operations of the utility industry and the current policy and emerging technology issues facing the business. The course includes significant interaction with industry officials and utility business operations.

ECE 586 Communication and SCADA Systems for Smart Grid 3.  
This is an introductory course on communication technologies and SCADA (supervisory control and data acquisition) systems for smart electric power applications. The fundamental concepts, principles, and practice of how communication systems operate are introduced and the function of main components reviewed. Application of communication systems for electric power, in particular SCADA architecture and protocols are also introduced. The course includes hands-on experience with typical intelligent electronic devices interconnected by a communication system.

ECE 591 Special Topics In Electrical Engineering 1-6.  
**Prerequisite:** B average in technical subjects.  
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

ECE 592 Special Topics In Electrical Engineering 1-6.  
**Prerequisite:** B average in technical subjects.  
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

ECE 600 ECE Graduate Orientation 1.  
Introduction of the Electrical and Computer Engineering Department graduate program. Introduction to computing and library facilities; Review of NC State student code of conduct and ethics. Structure of the ECE department. General information for starting graduate studies. Overview of on-going research projects by faculty members. Must hold graduate standing.

ECE 633 Individual Topics In Electrical Engineering 1-3.  
**Prerequisite:** B average in technical subjects.  
 Provision of opportunity for individual students to explore topics of special interest under direction of a member of faculty.

ECE 634 Individual Studies In Electrical Engineering 1-3.  
**Prerequisite:** Graduate standing.  
The study of advanced topics of special interest to individual students under direction of faculty members.

ECE 685 Master’s Supervised Teaching 1-3.  
**Prerequisite:** Master’s student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.
ECE 690 Master’s Exam 1-9.
ECE 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

ECE 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

ECE 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

ECE 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their thesis.

ECE 705 Memory Systems 3.
Prerequisite: ECE 521, Computer Design and Technology.
Covers recent research on overcoming the problem of memory access and memory speed, two major limitations on the speed of computers. Overview of the current state of memory technologies, novel cache structures and management techniques, prefetching, memory compression, and parallelism at the instruction and thread levels. Research papers required.

ECE 706 Advanced Parallel Computer Architecture 3.
Prerequisite: ECE/CSC 506, ECE 521.
Advanced topics in parallel computer architecture. Hardware mechanisms for scalable cache coherence, synchronization, and speculation. Scalable systems and interconnection networks. Design or research project required.

ECE 712 Integrated Circuit Design for Wireless Communications 3.
Prerequisite: ECE 511.
Analysis, simulation, and design of the key building blocks of an integrated radio: amplifiers, mixers, and oscillators. Topics include detailed noise optimization and linearity performance of high frequency integrated circuits for receivers and transmitters. Introduction to several important topics of radio design such as phase-locked loops, filters and large-signal amplifiers. Use of advanced RF integrated circuit simulation tools such as SpectreRF or ADS for class assignments.

ECE 718 Computer-Aided Circuit Analysis 3.
Prerequisite: ECE 511.
Steady state and transient analysis of circuits with emphasis on circuit theory and computer methods. Consideration of many analysis techniques, including linear nodal, signal flow graph, state equation, time-domain and functional simulation and analysis of sampled data systems. Sensitivity and tolerance analysis, macromodeling of large circuits and nonlinear circuit theory.

ECE 719 Advanced Microwave Design 3.
Prerequisite: ECE 549.
Development and examination of techniques used in the design of microwave and millimeter wave components and systems. Specific topics include frequency planning, system design using modules, and design of microwave amplifiers and oscillators. Design for specified frequency, noise, power, mixer or oscillator performance will be covered. There are three design projects: system planning, amplifier design, and oscillator design all using commercial microwave computer aided design tools.

ECE 720 Electronic System Level and Physical Design 3.
Prerequisite: ECE 520.
Study of transaction-level modeling of digital systems-on-chip using SystemC. Simulation and analysis of performance in systems with distributed control. Synthesis of digital hardware from high-level descriptions. Physical design methodologies, including placement, routing, clock-tree insertion, timing, and power analysis. Significant project to design a core at system and physical levels. Knowledge of object-oriented programming with C and register-transfer-level design with verilog or VHDL is required.

ECE 721 Advanced Microarchitecture 3.
Prerequisite: ECE 521.
Survey of advanced computer microarchitecture concepts. Modern superscalar microarchitecture, complexity-effective processors, multithreading, advanced speculation techniques, fault-tolerant microarchitectures, power and energy management, impact of new technology on microarchitecture. Students build on a complex simulator which is the basis for independent research projects.

ECE 722 Electronic Properties of Solid-State Materials 3.
Prerequisite: ECE 530.
Materials and device-related electronic properties of semiconductors. Included topics: energy band structure, electrical and thermal transport phenomena, scattering processes, localized energy states, equilibrium and non-equilibrium semiconductor statistics.

ECE 723 Optical Properties Of Semiconductors 3.
Prerequisite: ECE 530.
Materials and device-related properties of compound optical semiconductors. Included topics: band structure, heterojunctions and quantum wells, optical constants, waveguides and optical cavities, absorption and emission processes in semiconductors, photodetectors, light emitting diodes, semiconductor lasers.

Prerequisite: ECE 530.
Basic physical phenomena responsible for operation of solids-state devices. Examination and utilization of semiconductor transport equations to explain principles of device operation. Various solid-state electronics devices studied in detail.

ECE 725 Quantum Engineering 3.
Prerequisite: ECE 530, and PY 401.
Development of advanced engineering concepts at the quantum level relevant to nanoscience, nanoelectronics, and quantum photonics. Topics include tunneling phenomena, specifics of time dependent and time independent perturbation methodology for addressing applications under consideration, including the WKB approach, and an introduction to second quantization for engineers. Applications include, but are not limited to, tunneling in a two-level system, molecular rotation through excitation, field emission, van der Waal interactions, optical absorption in quantum wells, and electron transport through model molecules.

ECE 726 Advanced Feedback Control 3.
Prerequisite: ECE 516.
Advanced topics in dynamical systems and multivariable control. Current research and recent developments in the field.

ECE 732 Dynamics and Control of Electric Machines 3.
Prerequisite: ECE 453 or ECE 592.
Dynamic behavior of AC electric machines and drive systems; theory of field orientation and vector control for high performance induction and synchronous machines; permanent magnet and reluctance machines and their control; principles of voltage source and current source inverters, and voltage and current regulation methods.
ECE 733 Digital Electronics 3.
Prerequisite: ECE 546.
In-depth study of digital circuits at the transistor level. Topics include fundamentals; high speed circuit design; low-power design; RAM; digital transceivers; clock distribution; clock and data recovery; circuits based on emerging devices. Project.

ECE 734 Power Management Integrated Circuits 3.
Prerequisite: ECE 511 and ECE 534.
Review of modern power management converters and circuits; Review modeling and control of converters; Detail discussion of voltage and current mode controllers; Understanding of power converter losses and optimization method, as well as management of power; Integrated circuit design of various power management chips.

ECE 736 Power System Stability and Control 3.
Prerequisite: ECE 451 and ECE 750.

ECE 739 Integrated Circuits Technology and Fabrication Laboratory 3.
Prerequisite: ECE 538.
An integrated circuit laboratory to serve as a companion to ECE 538. Hands-on experience in semiconductor fabrication laboratory. Topics include: techniques used to fabricate and electrically test discrete semiconductor devices, the effects of process variations on measurable parameters.

ECE 745 ASIC Verification 3.
Prerequisite: ECE 520.
This course covers the verification process used in validating the functional correctness in today's complex ASICs (application specific integrated circuits). Topics include the fundamentals of simulation based functional verification, stimulus generation, results checking, coverage, debug, and formal verification. Provides the students with real world verification problems to allow them to apply what they learn.

ECE 751 Detection and Estimation Theory 3.
Prerequisite: ECE 514, ECE 421.
Methods of detection and estimation theory as applied to communications, speech and image processing. Statistical description of signals and representation in time, spatial and frequency domains; Bayesian methods, including Wiener, Kalman and MAP filters; performance measures; applications to both continuous and discrete systems.

ECE 752 Information Theory 3.
Prerequisite: ECE 514: Random Processes.
An overview of Shannon's theory of information, which establishes fundamental limits on the performance of data compression and quantization algorithms, communication systems, and detection and estimation algorithms. Topics include information measures and their properties, information source models, lossless data compression, channel coding and capacity, information theory and statistics, and rate-distortion theory. Applications of information theory will also be discussed, including Lempel-Ziv data compression, vector quantization, error-correcting codes, satellite communications and high-speed modems.

ECE 755 Advanced Robotics 3.
Prerequisite: ECE 555; MAE 544.
Advanced robotics at its highest level of abstraction; the level of synthesizing human reasoning and behavior. Advanced robotics deals with the intelligent connection of perception to action. At this level the subject requires knowledge of sensing(computer vision, tactile, sonar), and reasoning (artificial intelligence: machine learning, planning, world modeling). The advanced robotics course will be valuable for students who wish to work in the area.

ECE 756 Advanced Mechatronics 3.
Prerequisite: ECE 456 or ECE 556 with a Grade B+ and above.
A project-oriented course focusin on the design, analysis, and implementation of advanced mechatronics technologies, including large-scale distributed sensors, distributed-actuators, and distributed-controllers connected via communication networks. Will use unmanned vehicles as the project platform, with applications from sensors, actuators, network-based controllers, cameras, and microcontrollers. ECE 516 is recommended.

ECE 759 Pattern Recognition 3.
Prerequisite: ECE(CSC) 514, ST 371, B average in ECE and MA.
Image pattern recognition techniques and computer-based methods for scene analysis, including discriminate functions, feature extraction, classification strategies, clustering and discriminant analysis. Coverage of applications and current research results.

ECE 762 Advanced Digital Communications Systems 3.
Prerequisite: ECE 515.
An advanced graduate-level course in digital communications. Topics include signal design, equalization methods and synchronization techniques for realistic communication channels. Projects concentrate on literature review and computer simulations.

ECE 763 Computer Vision 3.
Prerequisite: ECE 558 and ECE 514.
Analysis of images by computers. Specific attention given to analysis of the geometric features of objects in images, such as region size, connectedness and topology. Topics include: segmentation, template matching, motion analysis, boundary detection, region growing, shape representation, 3-D object recognition including graph matching.

ECE 766 Signal Processing for Communications & Networking 3.
Prerequisite: Graduate standing.
This course deals with the signal processing principles underlying recent advances in communications and networking. Topics include: smart-antenna and multi-input multi-output (MIMO) techniques; multiluser communication techniques (multiple access, power control, multiluser detection, and interference management); signal processing in current and emerging network applications such as cognitive radio and social networks. Knowledge of linear algebra and stochastic analysis is required.

ECE 767 Error-Control Coding 3.
Prerequisite: ECE 514 Random Processes; linear algebra at the undergraduate level is strongly recommended.
An introduction to the theory and practice of codes for detecting and correcting errors in digital data communication and storage systems. Topics include linear block codes, cyclic codes, cyclic redundancy checksums, BCH and Reed-Solomon codes, convolutional codes, trellis-coded modulation, LDPC and turbo codes, Viterbi and sequential decoding, and encoder and decoder architecture. Applications include the design of computer memories, local-area networks, compact disc digital audio, NASA's deepspace network, high-speed modems, communication satellites, and cellular telephony.
ECE 773 Advanced Topics in Internet Protocols 3.
Prerequisite: CSC/ECE 573.
Cutting-edge concepts and technologies to support internetworking in general and to optimize the performance of the TCP/IP protocol suite in particular. Challenges facing and likely evolution for next generation internetworking technologies. This course investigates topics that include, but may not be limited to: Internet traffic measurement, characterization and modeling, traffic engineering, network-aware applications, quality of service, peer-to-peer systems, content-distribution networks, sensor networks, reliable multicast, and congestion control.

ECE 774 Advanced Network Security 3.
Prerequisite: CSC/ECE 570, CSC/ECE 574.
A study of network security policies, models, and mechanisms. Topics include: network security models; review of cryptographic techniques; internet key management protocols; electronic payments protocols and systems; intrusion detection and correlation; broadcast authentication; group key management; security in mobile ad-hoc networks; security in sensor networks.

ECE 775 Advanced Topics in Wireless Networking 3.
Prerequisite: ECE/CSC 575.
Reviews the current state of research in wireless networks, network architectures, and applications of wireless technologies; students will design, organize, and implement or simulate systems in a full-semester research project. For students with background in networking and communications who wish to explore research and development topics.

ECE 776 Design and Performance Evaluation of Network Systems and Services 3.
Prerequisite: CSC(ECE) 570 and CSC(ECE) 579.
Introduction to the design and performance evaluation of network services. Topics include top-down network design based on requirements, end-to-end services and network system architecture, service level agreements, quantitative performance evaluation techniques. Provides quantitative skills on network service traffic and workload modeling, as well as, service applications such as triple play, internet (IPTV), Peer-to-peer (P2P), voice over IP (VoIP), storage, network management, and access services.

ECE 777 Telecommunications Network Design 3.
Prerequisite: ECE 570, ECE 579.
Analytic modeling and topological design of telecommunications networks, including centralized polling networks, packet switched networks, T1 networks, concentrator location problems, routing strategies, teletraffic engineering and network reliability.

ECE 785 Topics in Advanced Computer Design 3.
Prerequisite: ECE 520, ECE 521.
In depth study of topics in computer design; advantages and disadvantages of various designs and design methodologies; technology shifts, trends, and constraints; hardware/software tradeoffs and co-design methodologies.

ECE 786 Topics in Advanced Computer Architecture 3.
Prerequisite: ECE 521, ECE/CSC 506.
In-depth study of research topics in computer architecture; mechanisms and their implementations; advantages and disadvantages of various mechanisms; technology shifts, trends, and constraints.

ECE 791 Special Topics In Electrical Engineering 3-6.
Prerequisite: B average in technical subjects.
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

ECE 792 Special Topics In Electrical Engineering 3-6.
Prerequisite: B average in technical subjects.
Two-semester sequence to develop new courses and to allow qualified students to explore areas of special interest.

ECE 801 Seminar in Electrical and Computer Engineering 1-3.

ECE 804 Seminar in Comm/Sig PR 1-3.

ECE 833 Individual Topics In Electrical Engineering 1-3.
Prerequisite: B average in technical subjects.
Provider of opportunity for individual students to explore topics of special interest under direction of a member of faculty.

ECE 834 Individual Studies In Electrical Engineering 1-3.
Prerequisite: Graduate standing.
The study of advanced topics of special interest to individual students under direction of faculty members.

ECE 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ECE 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

ECE 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Elementary Education (ELM)

ELM - Elementary Education Courses

ELM 250 Introduction to Elementary Education in a Global Society 3.
Prerequisite: Sophomore standing.
Introduction to the major conceptual and intellectual foundations of the teaching profession, the sociology and culture of elementary schools and classrooms, and the world of work of elementary teachers. Fieldwork in schools and related settings maybe required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences. Students interested in Elementary Education.
ELM 310 Children’s Thinking and Additive Reasoning 3.
Prerequisite: ELM 250, Junior standing, Elementary Education Majors.
Examination of mathematical reasoning processes in primary grade children and the theory and practice of active teaching strategies designed to motivate and engage children in mathematics learning in grades K-3. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

ELM 320 Teaching Science in the Primary Grades 3.
Prerequisite: ELM 250, Junior standing, Elementary Education Majors.
Examination of science knowledge and thinking in primary-age children. Development and application of methods for teaching science in the primary grades that leads to active learning of science as a process of inquiry. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

ELM 330 Teaching Reading in Elementary School: K-2 3.
Prerequisite: ELM 250, Junior standing, Elementary Education Majors.
ELM 330 is designed to prepare preservice teachers to teach reading and to lead to licensure in the elementary grades. Specific topics that relate to the theory and practice of teaching reading for early and emergent readers, including literature and struggling readers, will be examined. Fieldwork in schools and related settings may be required in lieu of lecture in occasion. Students are responsible for transportation to and from their school based experiences.

ELM 335 Teaching Reading in the Elementary School: 3-5 3.
Prerequisite: ELM 330, Junior standing, Elementary Education Majors.
ELM 335 is designed to prepare preservice teachers to teach reading and to lead to licensure in the elementary grades. Specific topics that relate to the theory and practice of teaching reading for upper elementary grade readers, including information and media literacy and literature, will be examined. Fieldwork in schools and related settings may be required in lieu of lecture in occasion. Students are responsible for transportation to and from their school based experiences.

ELM 340 Children Design, Create and Invent 3.
Prerequisite: ELM 370, Junior standing, Elementary Education Majors.
An active hands-on class where prospective elementary school teachers develop learning activities that children can use to stimulate their imaginations and learn fundamental concepts in science, technology, engineering, and mathematics. Part of a program leading to licensure in Elementary Education.

ELM 350 Assessment of Learning and Behavior 3.
Prerequisite: ELM 250, Junior standing, Elementary Education Majors.
Application of knowledge of pedagogy and development to develop high-quality strategies for formative and summative assessment. Best practices using developmentally-appropriate assessment strategies including authentic assessment, portfolios and electronic portfolios, real-time feedback, open- and closed-ended formal assessments, and standardized testing. Particular attention to examining the rationale for assessment and the implications of assessment.

ELM 370 Connections Seminar I The Elementary Classroom and School Community 3.
Prerequisite: ELM 250, Junior standing, Elementary Education Majors.
The purpose of this course is to introduce preservice teachers to the world of public school classrooms and school communities and to the tasks of teaching. Particular emphasis is placed on building a positive classroom climate and implementing effective classroom management strategies and routines. Weekly fieldwork in schools and related settings is required 3 hours a week. Students are responsible for transportation to and from their school based experiences.

ELM 375 Connections Seminar II Cultural Identity, Social Justice and Diverse Learners 3.
Prerequisite: ELM 370; Junior standing, Elementary Education majors.
The purpose of the course is to help prospective elementary grades teachers develop the competencies to provide equitable opportunities to all of their future students. To do this, students will investigate issues of systemic injustice and the role of the school in interrupting cycles of inequality, and develop the capacity to engage in culturally relevant pedagogy. Weekly fieldwork in schools and related settings is required 3 hours a week. Students are responsible for transportation to and from their school based experiences.

ELM 400 Connections Seminar III Instructional Design and Assessment 3.
Prerequisite: ELM 375, Senior standing, Elementary Education Majors.
In this course preservice elementary educators will examine research-verified practices in instructional design and assessment that are designed to meet the needs of diverse K-6 learners. This course will prepare candidates to plan appropriate units of study, learning experiences and assessment methods for use in the elementary classroom. Weekly fieldwork in schools and related settings is required. Students are responsible for transportation to and from their school based experiences.

ELM 410 Children’s Thinking and Multiplicative Reasoning 3.
Prerequisite: ELM 310, Junior standing, Elementary Education Majors.
This course is designed to prepare preservice teachers to teach math in the intermediate grades and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching of math will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

ELM 420 Teaching Science in the Intermediate Grades 3.
Prerequisite: ELM 320, Senior standing, Elementary Education Majors.
This course is designed to prepare preservice teachers to teach science in intermediate grades and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching science will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

ELM 430 Teaching Language Arts in the Elementary School 3.
Prerequisite: ELM 335, Senior standing, Elementary Education Majors.
This course is designed to prepare preservice teachers to teach language arts and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching language arts will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.
ELM 440 Teaching Children with Special Needs in the Elementary Classroom 3.
Prerequisite: ELM 350, ELM 375, Senior standing, Elementary Education Majors, Corequisite: ELM 420.
This course is designed to prepare preservice teachers to teach students with special needs and to lead to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching students with special needs will be examined. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

ELM 450 The Arts for Elementary Education 3.
Prerequisite: ELM 375, Senior standing, Elementary Education Majors. This course is designed to prepare preservice teachers to integrate the arts; visual music, dance and drama, into the content areas. Successful completion of this course leads to licensure in the elementary grades. Specific methodologies that relate to the theory and practice of teaching the arts will be examined.

ELM 460 Social Studies for the Young Learner 3.
Prerequisite: ELM 370, Junior standing, Elementary Education Majors. This course is designed to prepare preservice teachers to teach social studies and lead to licensure in the elementary grades. The course is an examination of curriculum, instruction, and learning in K-6 social studies education. Emphasizes development of the social studies; curricular strategies and components; teaching strategies; and learner outcomes. Fieldwork in schools and related settings may be required in lieu of lecture on occasion. Students are responsible for transportation to and from their school based experiences.

Prerequisite: ELM 400, Elementary Education Majors, Admission to the Professional Semester, Corequisite: ELM 484.
ELM 480 Linking Theory and Practice is designed as the capstone course in the Elementary Education Program. Teacher candidates will meet regularly to analyze and discuss their student teaching experiences and connect new learning to previous university coursework. In addition, teacher candidates will complete their edTPA Tasks and other culminating activities required by the program.

ELM 484 Student Teaching in Elementary Education 9.
Prerequisite: ELM 480, ELM 400, Elementary Education Majors, Admission to the Professional Semester. Culminating experience for Elementary Education majors. A minimum of 10 weeks of supervised teaching in an elementary school classroom, demonstrating competent applications of standards-based practices and other required knowledge, skill, and dispositions outcomes. Taken concurrently with ELM 480. Students responsible for transportation to placement site.

ELM 515 Instructional Practice in Schools I 1.
Prepares pre-service teachers to develop competencies in assessment, instructional design, and tutoring and leads to initial licensure in the elementary grades. Includes 15-20 hours of fieldwork; transportation to schools is the responsibility of the students.

ELM 516 Instructional Practice in Schools II 2.
Corequisite: ELM 572, ELM 573, ELM 575.
Prepares pre-service teachers to develop competencies in assessment, instructional design, and teaching in whole class settings and leads to initial licensure in the elementary grades. Includes 30 hours of fieldwork; transportation to the schools is the responsibility of the students.

ELM 520 Methods of Teaching Elementary School Science 3.
This course is intended for teachers seeking to expand their knowledge and skills in teaching elementary school science. The course examines the purposes, scope, sequences, materials, and methodologies for teaching science in elementary schools to a diverse student body. It develops skills in planning, instructing, and assessing understanding of science content and processes. It links instruction and assessment and addresses relevant content topics in chemistry, biology, physics, and earth and space science.

ELM 530 Social Studies In the Elementary School 3.
Advanced professional training in teaching of social studies for middle grades and elementary teachers, including in-depth introduction to research-based teaching strategies, instructional resources and literature of the field.

ELM 533 Targeted Literacy Assessment and Instruction for Elementary School 3.
Intended for teachers seeking to expand their knowledge and skills in assessing and teaching elementary reading, particularly to students with reading difficulties. Exploring the purposes, sequences, and materials for identifying students' instructional strengths and learn methods for providing appropriate evidence-based reading instruction. Closely links reading assessment and reading instruction and addresses relevant content topics in elementary reading development, assessment, and instruction.

ELM 537 Teaching Children's Literature 3.
Instructions for educators in quality children's literature, specific needs of young reader, genres of children's literature, strategies for instructing children's literature, ways to target reader's interests, and design of literature units.

ELM 539 Special Problems in Elementary School 1-6.
In-depth study of topical problems in elementary education selected from areas of current concern to practitioners in education.

ELM 540 Reading In the Elementary School 3.
Theoretical foundations of reading instruction and current methods and materials for teaching reading, with emphasis on planning and implementing reading programs for children in kindergarten through grade six.

ELM 555 Number Systems and Operations: K-5 Mathematical Tasks 3.
Analysis and construction of effective mathematical tasks in teaching number systems and operations at the K-5 level; attention is also given to the expansion of content knowledge.

Focus on rational number concepts through learning trajectories at the K-5 level; attention also given to problem solving and content knowledge.

ELM 557 Data Analysis and Measurement: K-5 Classroom Interactions 3.
Focus on statistical literacy of elementary teachers and the teaching of data analysis and measurement to K-5 students; attention is also given to learning methods which facilitate appropriate classroom interactions.

ELM 558 Algebraic Reasoning: K-5 Discourse and Questioning 3.
Focus on the early algebra concepts of functional thinking and generalized arithmetic in relationship to pedagogical practices centered on questioning in the mathematics classroom.
ELM 559 Geometry and Spatial Visualization: K-5 Assessment 3.
Formative and summative assessment strategies of students' geometric thinking in elementary grades; Concept development of 2- and 3-dimensional Geometry. Attention also given to diagnosis of student errors.

Generating mathematical representations and making explicit connections between concepts; Pedagogy designed to equip elementary teachers to become mathematics teacher-leaders in school settings; Focus given to topics integrated within mathematical strands.

ELM 571 Language Arts, New Literacies and Media for Initial License 3.
Examine research-based processes for writing instruction, effects of and approaches for use of technology on literacy development, and effects of media and new literacies (non-print literacies, e.g. digital, visual, film) on literacy learning and development in elementary schools. Restricted to ELM MAT students.

ELM 572 Methods for Teaching Reading in the Elementary Classroom for Initial License 3.
ELM 572 prepares pre-service teachers to teach reading and leads to licensure in the elementary grades. The course examines specific research-based methodology that relates to the theory and practice of teaching reading for elementary readers. Restricted to ELM, MAT students.

ELM 573 Methods for Teaching Elementary School Science for Initial License 3.
ELM 573 prepares preservice teachers to teach science and leads to licensure in the elementary grades. The course examines specific research verified methodologies that relate to the theory and practice of teaching science to elementary students. Restricted to ELM MAT students.

ELM 574 Methods for Teaching Mathematics in the Elementary Classroom for Initial License 3.
Prepares preservice teachers to teach mathematics and leads to licensure in the elementary grades. Examines specific research-based methodologies that relate to the theory and practice of teaching mathematics to elementary students. Limited to students enrolled in MAT Elementary Education program.

ELM 575 Social Studies in the Elementary School for Initial License 3.
Designed to prepare pre-service teachers to teach social studies and to lead to licensure in the elementary grades. The course is an examination of curriculum, instruction, and learning in K-6 social studies education. Emphasis include development of the social studies, curricular principles and components, research verified teaching strategies, and learner outcomes. Restricted to ELM MAT students.

ELM 590 Special Problems in Elementary Education 1-6.
In-depth study of topical problems in teaching and learning of current and special interest to elementary education practitioners.

ELM 630 Independent Study in Elementary Education 1-3.
Detailed investigation of topics of particular interest to graduate students under faculty direction on a tutorial basis. Determination of credits and content by faculty member in consultation with department head.

ELM 644 Practicum in Elementary Education 1-6.
Supervised practical experiences in schools and area agencies concerned with education of elementary-age students.

ELM 654 Internship In Elementary Education 1-6.
Supervised opportunities for advanced professional development in contexts concerned with elementary grades education.

Engineering (E)

E - Engineering Courses

E 101 Introduction to Engineering & Problem Solving 1.
Prerequisite: Engineering Majors, Freshman standing.
An introduction to the College of Engineering as a discipline and profession. Emphasis on engineering design, interdisciplinary teamwork, and problem solving from a general engineering perspective. Overview of academic policies affecting undergraduate engineering students. Exposure to College of Engineering and university-wide programs and services.

E 115 Introduction to Computing Environments 1.
Introduction to the NC State computing system, and to student-owned computing resources. Includes topics such as maintaining your own computer, learning about campus-based computing resources and applications (how to access and use them), ethics and professionalism in the use of computing resources, introduction to web development and other campus resources.

E 122 Engineering Academic Success 1.
This 8-week course is designed to teach students a variety of proven strategies for creating greater academic, professional, and personal success. Enrollment is required of students in the College of Engineering who were unsuccessful in completing E101 and/or have an earned GPA less than 2.0 after the first semester of the freshman year. Topics include: time management, goal setting, stress management, study skills, learning styles, and campus resources using a platform of lectures and guest speakers.

E 144 Academic and Professional Preparation for Engineering I 1.
Assist new freshmen engineering students in the transition from high school to the collegiate environment. Cover critical-thinking; problem solving techniques; academic skills and time management.

E 145 Academic and Professional Preparation for Engineering II 1.
Engineering as a field of study and profession. Career and professional development, goal setting, decision making and effective communication strategies.

E 201 Engineering Transfer to Success 1.
Prerequisite: E101 or Introduction to College Course.
This 8-week course will provide an overview of the NC State University policies and procedures, organizations, and resources available for enhancing the academic success of new transfer students in the College of Engineering. Lectures and discussion from departmental representatives will focus on requirements and availability for financial aid, cooperative education, career services, and campus student organizations. Emphasis will be placed on acclimating student through teamwork and academic achievement within the first year of transfer.

E 298 Special Topics Engineering 1-3.

E 304 Introduction to Nano Science and Technology 3.
Prerequisite: MA 242 and PY 208 with grade of C- or higher.
Fundamental concepts of Nano-Science and Technology including scaling, nano-scale physics, materials, mechanics, electronics, heat transfer, photonics, fluidics and biology. Applications of nano-technology.
E 490 Fundamentals of Engineering(Fe) Exam Preparation 1.
Prerequisite: Engineering Majors, Senior standing, Graduate students, or PBS status.
Preparation for graduating seniors in engineering to take the Fundamentals of Engineering (FE) Examination. Information on how to register for the FE exam, exam strategy, and a review of selected science and engineering topics through active learning exercises directed at working sample examination problems. Credit may not be counted toward graduation.

E 497 Engineering Research Projects 1-3.
Prerequisite: Junior standing in College of Engineering, Engineering Scholars Program or Engineering Research Center Scholars.
Projects in research, design or development in engineering or computer science. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

E 531 Dynamic Systems and Multivariable Control I 3.
Prerequisite: MA 341, MA 405.
Introduction to modeling, analysis and control of linear discrete-time and continuous-time dynamical systems. State space representations and transfer methods. Controllability and observability. Realization. Applications to biological, chemical, economic, electrical, mechanical and sociological systems.

E 731 Dynamic Systems and Multivariable Control II 3.
Prerequisite: OR(E,MA) 531.

**Engineering - Mechatronics (EGM)**

**EGM - Engineering - Mechatronics Courses**

**English (ENG)**

**ENG - English Courses**

ENG 100 Reading and Writing Rhetorically 4.
Intensive practice in reading and writing critically and rhetorically, with attention to how those change according to purpose and situation. Introduction to rhetorical concepts and elements with application to a variety of academic, professional, or civic texts. Exploration of principles of argument and organization. Guidance in developing flexible, self-aware reading and composing processes. Practice in seeking, providing, and responding to constructive feedback. Practice with making choices about grammar, mechanics, and style appropriate to specific rhetorical situations. Extensive writing practice and individualized coaching to support ongoing development as a writer. Intended as preparation for ENG 101. Departmental consent required.

ENG 101 Academic Writing and Research 4.
Prerequisite: Placement via English Department guidelines.
Intensive instruction in academic writing and research. Basic principles of rhetoric and strategies for academic inquiry and argument. Instruction and practice in critical reading, including the generative and responsible use of print and electronic sources for academic research. Exploration of literate practices across a range of academic domains, laying the foundation for further writing development in college. Continued attention to grammar and conventions of standard written English. Successful completion of ENG 101 requires a C- or better. Credit for ENG 101 is not allowed if the student has already fulfilled the first-year writing requirement.

ENG 105 Writing and Research in the Disciplines 1.
Restricted to: Transfer students with a transferring first-year writing course.
Examination of inquiry and writing across a range of academic disciplines, laying the foundation for further writing development in college-level writing across the curriculum. Refinement of basic principles of rhetoric and how those connect to writing in disciplinary communities. Restricted to transfer students with a transferring first-year writing course. Successful completion of ENG 105 requires a grade of C- or better. Together with approved transfer credit hours, this course satisfies the Introduction to Writing component of the General Education Program.

ENG 1GEP 100 Level English Composition 3.
100 Level English Composition. Transfer students with 3 hours of ENG 1GEP credit may receive ENG 101 equivalency by completing ENG 105 with a C- or better.

ENG 201 Writing Literary Analysis 3.
Writing about literature for a variety of audiences. Strategies for writing close textual analysis - including attention to versification, narrative technique, and dramatic structure - and for articulating biographical, literary-historical, and cultural-historical contexts. Conventional genres of literary analysis, including "close readings,” reviews, and editorial introductions; conventions of organization and prose style in both academic and professional literary discourse; MLA conventions for prose style and documentation.

ENG 206 Studies In Drama 3.
Selected drama from the classical period to the present. Emphasis on reading for enjoyment as well as understanding theory and development of tragedy, comedy, and other modes of dramatic expression. Writers such as Sophocles, Euripides, Shakespeare, Ibsen, and Shaw, and contemporary playwrights.

ENG 207 Studies In Poetry 3.
Main features of poetry such as tone, voice, form, diction, figurative language, and sound patterns. Reading of poetry from different periods with the goal of learning how to understand, appreciate, and analyze different kinds of poems.

ENG 208 Studies In Fiction 3.
Representative examples of novels and short stories from different periods, emphasizing understanding and appreciation of fiction as a genre, a knowledge of the features and techniques of fiction, and a sense of the development of the genre.

ENG 209 Introduction to Shakespeare 3.
Shakespeare for non-English majors. Seven to ten major plays, including representative comedies, such as The Taming of the Shrew; histories, such as Richard III; tragedies, such as Hamlet; and romances, such as The Tempest. Does not satisfy requirements for English major.
ENG 210 Introduction to Language and Linguistics 3.
Prerequisite: ENG 101.
Linguistics theory and method. Topics include the English sound system, morphology, syntactic structure, semantics, and historical and contemporary dialect variation. Language acquisition, language and the brain, and computer processing and human language.

ENG 214 Introduction to Editing 3.
Prerequisite: ENG 101.
Basic editorial skills with a wide range of publications. Stylistic editing (conventions of written English, consistency, effectiveness of syntax, appropriateness of diction), substantive editing (accuracy, legal issues, ethics), and production editing (layout, typography, electronic publication processing). Introduction to resources such as standard reference works and professional organizations.

ENG 216 Technologies for Texts 3.
Prerequisite: ENG 101.
Uses of computers for creating, designing, analyzing, and disseminating texts, both on desktops and on the Internet. Overview of technologies that facilitate reading, writing, and communication; development of skill with various applications and understanding of their capabilities, limitations, and historical analogues. Recommended for students in journalism and technical writing.

ENG 219 Studies in Great Works of Non-Western Literature 3.
Readings, in English translation, or non-Western literary masterpieces from the beginnings of literacy in the Middle East, Asia, and Africa to the modern period, including excerpts from texts such as the Upanishads, the Ramayana, the Sundialta, Gilgamesh, A Thousand and One Nights, and the Quran and such authors as Confucius, Oe Kenzaburo, Omar Khayyam, Rumi, and Amos Oz.

ENG 220 Studies in Great Works of Western Literature 3.
Credit is not allowed for both ENG 220 and ENG 221 or ENG 222.
Readings, in English translation, of Western literary masterpieces, from the beginnings of literacy in the Middle East and Europe towards the present, including such authors as Homer, Sophocles, Virgil, Ovid, Augustine, Danta, Machiavelli, Shakespeare, Cervantes, Moliere, Voltaire, Goethe, Austen, Flaubert, Dickinson, Tolstoy, Kafka, and Woolf. Credit will not be given for both ENG/FL 220 and either ENG/FL 221 or ENG/FL 222.

ENG 221 Literature of the Western World I 3.
Credit is not allowed for both ENG 221 and ENG 222.
Readings from English translations of Biblical, Classical, Medieval, and Early Renaissance literature, including works by such authors as Homer, Plato, Virgil, Ovid, St. Paul, St. Augustine, Marie de France, and Dante.

ENG 222 Literature of the Western World II 3.
Credit is not allowed for both ENG 222 and ENG 220.
Readings from English translations of Renaissance, Neo-Classical, Romantic, and Early Modern literature, emphasizing the cultures of continental Europe from the Renaissance to 1900, and including such authors as Petrarch, Erasmus, Rabelais, Machiavelli, Shakespeare, Moliere, Voltaire, Rousseau, Goethe, Flaubert, and Tolstoy.

ENG 223 Contemporary World Literature I 3.
Twentieth-century literature of some of the following cultures: Russian, Eastern European, Western European, Latin American, Canadian, Australian.

ENG 224 Contemporary World Literature II 3.
Twentieth-century literature of some of the following cultures: Asian, Arabian, African, Caribbean, Native-American.

ENG 232 Literature and Medicine 3.
Study of literature about illness, epidemics, and the science and practice of medicine. Readings will include works by authors such as Boccaccio, Defoe, George Eliot, Kafka, William Carlos Williams, Susan Sontag, and Tony Kushner.

ENG 233 The Literature of Agriculture 3.
A study of writings on the role of farming in the creation of culture and on the connection between the attention to words necessary for good writing and the attention to the land necessary for good farming. Readings may include ancient and modern texts from a variety of cultures and genres. Possible authors include Virgil, Jefferson, Hardy, Cather.

ENG 246 Literature of the Holocaust 3.
Fictional and nonfictional versions of the Holocaust, focusing on themes of survival, justice, theology, and the limits of human endurance.

African-American writing and its relationships to American culture and history. Covers such writers as Wheatley, Douglass, Chesnutt, Dunbar, DuBois, Hughes, Hurston, Wright, and Morrison.

ENG 249 Native American Literature 3.
A survey of Native American literatures from before contact with Europeans to contemporary culture. Writers may include: Apess (Pequot), Ridge (Cherokee), Silko (Laguna Pueblo), Momaday (Kiowa), Power (Sioux) Gunn Allen (Laguna-Sioux), Harjo (Creek), and Erdrich (Anishinaabe).

ENG 251 Major British Writers 3.
Credit is not allowed for ENG 251 and ENG 261 or ENG 262.
Significant British authors chosen from among such figures as Chaucer, Shakespeare, Milton, Swift, Pope, Austen, Wordsworth, Coleridge, Tennyson, Browning, Bronte, Dickens, Joyce, Eliot, Woolf, and Yeats. Credit will not be given for both ENG 251 and either ENG 261 or 262.

ENG 252 Major American Writers 3.
Credit is not allowed for both ENG 252 and ENG 265 or ENG 266.
Significant American authors chosen from among such figures as Franklin, Emerson, Thoreau, Hawthorne, Melville, Douglass, Stowe, Whitman, Dickinson, Twain, James, Frost, Faulkner, Hemingway, and Morrison. Credit will not be given for both ENG 252 and either ENG 265 or 266.

ENG 260 Introduction to Literary Study 3.
Prerequisite: ENG 101.
Introduces fundamental questions in literary history and critical theory. Emphasizes critical reading skills and prepares students for the kinds of courses--surveys, genre courses, author courses, problem-based courses--that are part of the English major. Papers prepared using standard word processing programs.

ENG 261 English Literature I 3.
Credit is not allowed for both ENG 261 and ENG 251.
A survey of English literature to 1660, including Old English, Middle English, and Renaissance writing, focusing on such central authors as Chaucer, Spenser, Marlowe, Shakespeare, Jonson, Donne, and Milton. Credit will not be given for both ENG 261 and ENG 251.

ENG 262 English Literature II 3.
Credit is not allowed for both ENG 262 and ENG 251.
A survey of English literature from 1660 to the present. Poetry, fiction, drama and intellectual prose by such central writers as Dryden, Pope, Swift, Johnson, Wollstonecraft, Wordsworth, Keats, Shelley, Bronte, Carlyle, Tennyson, Browning, Yeats, Woolf, Joyce and Eliot. Credit will not be given for both ENG 262 and ENG 251.
ENG 265 American Literature I 3.
Credit is not allowed for ENG 265 and ENG 252.
A survey of American literature from the beginnings to the Civil War, including such central authors as Edwards, Franklin, Irving, Emerson, Hawthorne, Melville, Poe, Stowe, Douglass, Thoreau, and Whitman. Credit will not be given for both ENG 265 and ENG 252.

ENG 266 American Literature II 3.
Credit is not allowed for both ENG 266 and ENG 252.
A survey of American literature from the Civil War to the present, including such central authors as Whitman, Dickinson, Twain, James, Crane, Wharton, Frost, Eliot, Hemingway, Hurston, Faulkner, Wright, O'Connor, and Morrison. Credit will not be given for both ENG 266 and ENG 252.

ENG 267 LGBTQI Literature in the U.S. 3.
Chronological survey of works of literature by and about gay, lesbian, bisexual, transgender, questioning, and intersex communities in the U.S. Primary texts will be considered in historical, political, and literary contexts. Brief consideration of early works from colonial period and 19th century with primary focus on 20th and 21st century texts.

ENG 281 Introduction to Creative Nonfiction 3.
Prerequisite: ENG 101.
This is an introductory course that will instruct students in writing, editing and appreciating the professional nonfiction one finds in magazines, on issue-oriented websites, and in general interest publications, from the New Yorker-style long article to the personal columns one finds on online media outlets: writing about an issue or event in a personal, stylish way while obtaining the rigor of journalism in scrupulous research and clarity. In an ever-enlarging media universe, this is the most visible and commercial of all the creative writing genres.

ENG 282 Introduction to Film 3.
Examination of basic film techniques and methods of film analysis. Emphasis on understanding and appreciating film as a major US and international art form and industry operating in various national, cultural, and historical contexts.

ENG 287 Explorations in Creative Writing 3.
Prerequisite: ENG 101.
Introduction to the basic elements and principles of three genres of creative writing: poetry, fiction and drama. Reading and class discussion of student work. Recommended for students with no prior experience in creative writing.

ENG 288 Fiction Writing 3.
Prerequisite: ENG 101.
Experience in writing short prose fiction. Class critiquing of student work and instruction in techniques of fiction.

ENG 289 Poetry Writing 3.
Prerequisite: ENG 101.
Experience in writing poetry. Class critiquing of student work and instruction in techniques of poetry.

ENG 292 Writing About Film 3.
Prerequisite: ENG 101.
Comprehensive study of various approaches to writing about film. Primary focus is on the critical and evaluative practice involved in writing film criticism for non-academic audiences. Film screenings, discussion of assigned readings, and in-class writing workshops aid students in preparing a portfolio of film writing that includes film reviews of various lengths.

ENG 298 Special Projects in English 1-3.
Faculty-guided independent study, or courses on special topics determined by departmental interest or need.

ENG 305 Women and Literature 3.
Prerequisite: Sophomore standing and above.
Nineteenth- and twentieth-century womens’ literature, as shaped by the intersecting and competing claims of gender, race, sexuality, and culture. Focus on fiction, accompanied by critical readings from American studies, feminist literary criticism, and postmodern theory.

Prerequisite: ENG 214.
Layout and design principles for written documents; desktop building; legibility, readability testing; conventions of proposals, instructions, and reports; basics of technical editing; usage, vocabulary, style manuals, editing mathematical equations, graphs, tables.

ENG 316 Introduction to News and Article Writing 3.
Prerequisite: ENG 101.

ENG 317 Designing Web Communication 3.
Prerequisite: ENG 214 or ENG 314.
A course in the layout, design, and composition of web-based communication. Students will learn to analyze audiences and their uses of information in order to plan, compose, and critically evaluate web-based communication. Students will acquire skill with HTML coding, screen design, and multimedia authoring and will apply these skills to the composition of a variety of web texts (i.e. websites). Course work will require students to become proficient with commercially available HTML and photoeditors.

ENG 321 Survey of Rhetorical Theory 3.
Prerequisite: Sophomore standing and above.
Principles of rhetorical theory from its classical origins through the modern period to the present time. Key concepts and theories that provide a critical understanding of the processes of persuasive symbol use.

ENG 323 Writing in the Rhetorical Tradition 3.
Prerequisite: ENG 101.
A writing course based on the study of rhetoric. Readings on the principles of invention, arrangement, and style; analysis of written texts; writing of persuasive texts for a variety of audiences and purposes.

ENG 324 Modern English Syntax 3.
Prerequisite: ENG 101.
Study of Modern English at the sentence level. Analysis of grammatical structure. Consideration of language variation in English.

ENG 325 Spoken and Written Traditions of American English Dialects 3.
Prerequisite: ENG 101.
Basic issues in the study of language; linguistic terminology and categories; grammatical traditions and topics such as prescriptivism and descriptivism, standard and non-standard, orality and literacy; language acquisition and awareness; language aesthetics and ethics.

ENG 326 History of the English Language 3.
Prerequisite: ENG 101.
Development of the English language from its Indo-European origins to the present. Emphasis on historical and comparative linguistic methodology and on changes in sound, syntax, and meaning.
ENG 327 Language and Gender 3.
Prerequisite: ENG 101.
Introduction to the use of language by men and women. Research in Linguistics and Women's Studies addressing issues such as the acquisition of gender-differentiated language, gender and conversational interaction, sexism in language, gender issues in society, and the relationship between language, gender, and other social constructs (e.g., class, culture, and ethnicity).

ENG 328 Language and Writing 3.
Prerequisite: ENG 101.
Study of language structure; specific attention to differences between spoken and written language; print conventions; error analysis; and the application of linguistics to rhetoric and composition. Analysis of a variety of grammatical approaches; how to evaluate grammar textbooks and compositions. Intended for English Education majors. Credit will not be awarded for both ENG 328 and ENG 324.

ENG 330 Screenwriting 3.
Prerequisite: 6 credit hours from courses in writing for media, creative writing, or Film Studies.
Writing for films, story planning, character development, communicating information, building scenes, relationships between script and cinematic dimensions, working with studios and editors.

ENG 331 Communication for Engineering and Technology 3.
Prerequisite: Junior standing. Credit is not allowed for both ENG 331 and ENG 332 or ENG 333.
Written communication in industrial and technical organizations, emphasizing internal communication with managers and technical personnel and including external communication with regulators, vendors, and clients. Intensive practice in writing; relationship of writing to oral and visual communication. For students in engineering and other primarily technological curricula. Credit is not allowed for more than one of ENG 331, ENG 332, and ENG 333.

ENG 332 Communication for Business and Management 3.
Prerequisite: Junior standing. Credit is not allowed for both ENG 332 and ENG 331 or ENG 333.
Written communication in business and public organizations, including both internal communication (such as instructions, policies, management reports) and external communication with clients, vendors, and publics. Intensive practice in writing; relationship of writing to oral and visual communication. For students in business and management-related programs. Credit is not allowed for more than one of ENG 331, ENG 332, and ENG 333.

ENG 333 Communication for Science and Research 3.
Prerequisite: Junior standing. Credit is not allowed for both ENG 333 and ENG 331 or ENG 332.
Written communication in scientific and research contexts, emphasizing relationship between research and writing in problem formulation, interpretation of results, and support and acceptance of research. Intensive practice in writing; relationship of writing to oral and visual communication. For students who plan careers in scientific research. Credit is not allowed for more than one of ENG 331, ENG 332, and 333.

ENG 349 African Literature in English 3.
Prerequisite: Sophomore standing and above.
Anglophone literature in Africa. Emphasis on the relationship between the African world-view and literary production and the persistent trend by African writers to connect literature with politics. Writers such as Achebe, Ngugi, Soyinka, and Serote.

ENG 350 Professional Internships 3.
Directed work for CHASS majors including work-site mentoring and evaluation. Department supervision includes a course work directed toward designing employment application materials, developing a portfolio of professional work or relevant research paper, considering a variety of career options, and reading literature on workplace socialization. Students must provide their own transportation to the internship site. Modest liability insurance fee required. Students must have at least a 2.5 overall GPA and at least a 3.0 GPA in the major, be a junior or senior CHASS major or minor, and must complete the application process outlined on the Internship Program Website or provide the internship coordinator with contact information for your supervisor at an internship you obtained independently.

ENG 359 Topics in Film Studies 3.
Critical approaches to focused film topics involving film genres, directorial styles, or trends within a national cinema. Topics will vary from semester to semester.

ENG 362 The British Novel of the 18th Century 3.
Prerequisite: Sophomore standing and above.
Emphasizes major novelists such as Defoe, Richardson, Fielding, Sterne, and Austen.

ENG 363 The British Novel of the 19th Century 3.
Prerequisite: Sophomore standing and above.
Emphasizes major novelists such as Dickens, Trollope, the Brontes, Eliot, and Hardy.

ENG 364 History of Film to 1940 3.
Prerequisite: Sophomore standing and above.
Technological developments and aesthetic movements that shaped international cinema production from the beginning of the industry to 1940. Formal evolution in camera movement, editing, sound, narrative form, and the documentary. The rise to prominence of Hollywood and international cinemas in historical, economic, and cultural contexts.

ENG 368 American Poetry to 1900 3.
Prerequisite: Sophomore standing and above.
American poetry written in English from the colonial period to 1900. Development of styles and themes in relation to historical context. Emphasis on poets such as Bradstreet, Taylor, Wheatley, Poe, Sigourney, Emerson, Longfellow, Whitman, Dickinson, and Robinson.

ENG 369 The American Novel of the 19th Century 3.
Prerequisite: Sophomore standing and above.
Major novels illustrating the development of American fiction from Romanticism to Realism and Naturalism. Works by such writers as Brown, Cooper, Hawthorne, Stowe, Melville, Twain, Howells, James, Norris, Crane, Chopin, and Dreiser.

ENG 370 Early Twentieth-Century Fiction 3.
Prerequisite: Sophomore standing and above.
Study of narrative fiction written during the first half of the twentieth century. Typical subjects: James, Conrad, Stein, Hemingway, Woolf, Faulkner, Hurston, Wright, Beckett.

ENG 371 Late Twentieth-Century Fiction 3.
Prerequisite: Sophomore standing and above.
ENG 372 Early Twentieth-Century Poetry 3.
Prerequisite: Sophomore standing and above.
Study of poetry written in English during the first half of the twentieth century. Typical subjects: Hardy, Robinson, Yeats, Eliot, Pound, H.D., Williams, Hughes, Moore, Stevens.

ENG 373 Late Twentieth-Century Poetry 3.
Prerequisite: Sophomore standing and above.

ENG 374 History of Film From 1940 3.
Prerequisite: Sophomore standing and above.
Technological developments and aesthetic movements that have shaped international cinema production from 1940 to the present. Evolution in camera movement, editing, sound, narrative form, and the documentary. Post-war Hollywood cinema and international film industries (both established and emerging) in historical, economic and cultural context.

ENG 375 African American Cinema 3.
Survey and analysis of African American film culture from 1900-present. Examination of pre-Hollywood, classical Hollywood, and Independent filmmaking. Particular focus on independent filmmakers’ response to dominant industry representations and the work of filmmakers who seek to create a specifically African American cinematic style.

ENG 376 Science Fiction 3.
Prerequisite: Sophomore standing and above.
Representative works of science fiction. Emphasis on works written in the twentieth century, with some attention to the history and development of the genre.

ENG 377 Fantasy 3.
Prerequisite: Sophomore standing and above.
Representative works in the genre of fantasy. Emphasis on works of 19th and 20th centuries. Authors such as Carroll, Lewis, Tolkien, Borges, LeGuin, and Gardner.

ENG 378 Women & Film 3.
This course will introduce students to the rich international history of women’s participation in the motion picture industry. Course includes readings, screenings, discussions, and a final examination.

ENG 380 Modern Drama 3.
Prerequisite: Sophomore standing and above.
Major plays and playwrights from Ibsen to Pinter, including at least some of the following: Strindberg, Chekhov, Shaw, O’Neill, Hellman, Pirandello, Brecht, Williams, Miller, Albee.

ENG 381 Creative Nonfiction Writing Workshop 3.
Prerequisite: ENG 215, 287, 288, or 289.
A workshop in creative nonfiction (literary or magazine journalism) for the student with demonstrated understanding of the basic techniques of creative writing and journalism.

ENG 382 Film and Literature 3.
Ways of adapting literary works to film form. Similarities and differences between these two media. Emphasis on the practical art of transforming literature into film. Attention to the impact of film upon literature.

ENG 384 Introduction to Film Theory 3.
Prerequisite: ENG 282.
Survey of critical approaches to film art. Application of theoretical paradigms--formalist, realist, psychoanalytic, feminist, poststructuralist--to individual films, genres, national cinemas and directors.

ENG 385 Biblical Backgrounds of English Literature 3.
Prerequisite: Sophomore standing and above.
Influences of the Bible—principal forms, genres, and texts—on major English and American writers such as Milton, Spenser, Melville, Eliot, and Faulkner.

ENG 388 Intermediate Fiction Writing Workshop 3.
Prerequisite: ENG 288; Students must have earned a B or better in ENG 288.
An intermediate workshop in creative writing for students with demonstrated understanding of the basic techniques of writing prose fiction.

ENG 389 Intermediate Poetry Writing Workshop 3.
Prerequisite: ENG 289; Students must have earned a B or better in ENG 289.
An intermediate workshop in creative writing for students with demonstrated understanding of the basic techniques of writing poetry.

ENG 390 Classical Backgrounds of English Literature 3.
Prerequisite: Sophomore standing and above.
Literature of the ancient Western world and its influence on English and American writing. Emphasis on the connections between the two bodies of literature. Covers such writers as Plato, Horace, Virgil, and St. Augustine.

ENG 391 Special Topics in Modern Drama 3.
Prerequisite: Sophomore standing and above.
Various topics in modern drama covering different cultures, issues, and theatrical practices within the last 100 years. Modern American drama, modern British drama, modern World Drama, and European theatre from World War II to the present.

ENG 392 Major World Author 3.
Prerequisite: Sophomore standing and above.
Intensive study in English, of the writings of one (or two) author(s) from outside the English and American traditions. Sample subjects: Homer, Virgil and Ovid, Lady Murasaki, Marie de France and Christine de Pizan, Dante, Cervantes, Goethe, Balzac and Flaubert, Kafka, Proust, Lessing and Gordimer, Borges and Marquez, Neruda, Achebe, Soyinka, Calvino, Walcott and Naipaul. Topics will vary from semester to semester. May be repeated for credit with new topic.

ENG 393 Studies in Literary Genre 3.
Prerequisite: Sophomore standing and above.
Concentrated treatment of one literary genre, such as the epic, the lyric, the drama, satire, romance, autobiography, the essay, the novel, or the short story. Treatment of materials from several national or ethnic cultures and several periods. All readings in English. Course may be taken three times for credit. Course may be taken 3 times in different genres.

ENG 394 Studies in World Literature 3.
Prerequisite: Sophomore standing and above.
Study of a subject in world literature: for example, African literature, Asian literature, Hispanic literature, East European literature, Comedy, the Epic, the Lyric, Autobiography, the Faust legend, or Metamorphosis. Subjects vary according to availability of faculty. Readings in English translation.

ENG 395 Studies in Rhetoric and Digital Media 3.
Prerequisite: ENG 101.
Study of the influence of emerging technologies on rhetorical theory and practice. Rhetorical analysis of texts, including visual and audio texts. Invention and construction of digital media texts as a means of engaging rhetorical theory and analysis. Topics vary to adapt to emerging technologies and changing vernacular practices.
ENG 398 Contemporary Literature I (1900 to 1940) 3.  
Prerequisite: Sophomore standing and above.  
British and American literature from 1900 to World War II, with  
representative authors such as Conrad, Yeats, Eliot, Joyce, Woolf,  
Faulkner, Shaw, Stein, O’Neill, and Wright. For comparative purposes,  
continental authors such as Kafka and Mann.

ENG 399 Contemporary Literature II (1940 to Present) 3.  
Prerequisite: Sophomore standing and above.  
Literature from World War II to the present, with representative authors  
such as Murdoch, Beckett, Nabokov, Ginsberg, Achebe, Fuentes,  
Kundera, Naipaul, and Morrison.

ENG 400 Applied Criticism 3.  
Prerequisite: LTN Majors, Senior standing, formal admission to the  
methods courses, Corequisite: ECI 450.  
Types and methods of literary criticism designed specifically for students  
intending to teach English in high school.

ENG 405 Literature for Adolescents 3.  
Prerequisite: Junior standing.  
The history, types, and characteristics of literature for adolescents.  
Emphasizes reading and analyzing the literature by exploring the  
themes, literary elements, and rationale for teaching literature for  
adolescents. Addresses ways in which this literature can be integrated  
and implemented in English/Language Arts curriculum.

ENG 406 Modernism 3.  
Prerequisite: Sophomore standing and above.  
International Modernist movement in literature, from its nineteenth-  
century origins to its culmination in the early twentieth century. Definitions  
of modernity, as embodied in a variety of genres. Placement of Modernist  
texts within a variety of cultures that produced them.

ENG 407 Postmodernism 3.  
Prerequisite: Sophomore standing and above.  
Literary expressions of Postmodernism, from its origins in the Modernist  
movement through its culmination in the later decades of the twentieth  
century. Definitions of post modernity, as embodied in a variety of genres.  
Placement of Postmodernist texts within a variety of cultures that have produced them.

ENG 410 Studies in Gender and Genre 3.  
Prerequisite: Sophomore standing and above.  
This course examines the ways in which writers have revised the literary  
genres to include gendered experience. It will focus on a different generic  
area, such as poetry, fiction, drama or autobiography, depending on its  
instructor.

ENG 411 Rhetorical Criticism 3.  
Prerequisite: Junior standing.  
Rhetorical analysis of public speeches, social movements, political  
campaigns, popular music, advertising, and religious communication.  
Neo-Aristotelian criticism, movement studies, genre criticism, dramatistic  
analysis, content analysis, fantasy theme analysis.

ENG 416 Advanced News and Article Writing 3.  
Prerequisite: ENG 316.  
Advanced work in writing news stories, profiles, features, and  
investigative stories. Includes analysis and critical reading of print media.  
Assumes thorough knowledge of AP style and rudiments of news and  
feature writing.

ENG 417 Editorial and Opinion Writing 3.  
Prerequisite: ENG 214, ENG 316.  
Discussing and writing newspaper and magazine editorials, with added  
attention to other forms of opinion in print, such as columns and books  
and music reviews.

ENG 420 Major American Author 3.  
Prerequisite: Sophomore standing and above.  
Intensive study of the writings of one (or two) American author(s).  
Developments across the career, relationships between the writing and  
the life, the writer’s participation in a culture and an historical moment.  
Sample subjects: Emerson and Thoreau, Melville, Whitman, Stowe  
and Douglass, Dickinson, Twain, James and Wharton, Frost, O’Neill,  
Fitzgerald and Hemingway, Faulkner, Hurston and Wright, O’Conner,  
Morrison.

ENG 421 Computer Documentation Design 3.  
Prerequisite: ENG 314, 331, 332 or ENG 333.  
Theory and design of documentation for computer hardware and  
software, including user guides, reference manuals, quick reference  
guides, tutorials, online documentation, and CD-based media delivery.  
Training in alternative documentation testing procedures, usability testing,  
and collaborative revision.

ENG 422 Writing Theory and the Writing Process 3.  
Prerequisite: ENG 101.  
Theory and research on the processes and contexts of written discourse;  
cognitive, socio-cultural, educational perspectives; reflective and  
research-based accounts of the writing process; analysis of discourse  
contexts and communities.

ENG 425 Analysis of Scientific and Technical Writing 3.  
Prerequisite: Junior standing.  
The role of communication in the creation of scientific knowledge and  
technical designs and artifacts; methods of analyzing texts and of  
studying their creation and use; relationships between writing and other  
forms of communication. Field research in a scientific or technological  
setting.

ENG 426 Analyzing Style 3.  
Prerequisite: ENG 101.  
Development of a greater understanding of and facility with style in  
written discourse. Theories of style, stylistic features; methods of  
analysis, imitation.

ENG 430 Advanced Screenwriting 3.  
Prerequisite: ENG 330.  
Advanced Screenwriting students will complete ready-to-sell screenplays  
over the course of the semester. Workload includes taking home two  
100-page scripts each week and giving a thorough critique both in writing  
and in class discussion. Course included pitch sessions, opening scene  
workshops, intensive reading and writing.

ENG 439 17th-Century English Literature 3.  
Prerequisite: Sophomore standing and above.  
Works of major nondramatic literary figures in England during the period  
1600-1700, such as Donne, Jonson, Herbert, Marvell, Bacon, and  
Browne.

ENG 448 African-American Literature 3.  
Prerequisite: Junior standing.  
Survey of African-American literature and its relationships to American  
culture, with an emphasis on fiction and poetry since 1945. Writers such  
as Bontemps, Morrison, Hurston, Baldwin, Hayden, Brooks, Naylor,  
Harper, and Dove.
ENG 449 16th-Century English Literature 3.
Prerequisite: Sophomore standing and above.
Nondramatic prose and poetry of the sixteenth century, with consideration of literary types and movements. Emphasis on major authors, including Sidney and Spenser.

ENG 451 Chaucer 3.
Prerequisite: Sophomore standing and above.
Introduction to the study of Chaucer through an intensive reading of The Canterbury Tales.

ENG 452 Medieval British Literature 3.
Prerequisite: Sophomore standing and above.
Readings in the rich poetic, thematic, and generic diversity of Medieval British literature. Representative selections from romance, dream-vision, allegory, fabliau, lyric, chronicle, saint's life, satire, in historical and cultural contexts. Prior knowledge of Middle English unnecessary.

ENG 453 The Romantic Period 3.
Prerequisite: Sophomore standing and above.
Emphasis on the major poetry of Blake, Wordsworth, Coleridge, Byron, Shelley, and Keats, with selected readings from other poets, prose writers, and dramatists of the period.

ENG 455 Literacy in the U.S. 3.
Prerequisite: ENG 101; Junior or senior standing.
Academic study of the nature, functions, acquisition, institutionalization, and present state of literacy in the U.S., with special focus on issues of cultural diversity and social inequality. Three contexts for literacy - personal, academic, and home/community - provide a range of readings, investigations, and opportunities for reflection and further study. Service-learning component links this academic study to required tutoring (2 hours per week) of children and adults in local community service agencies in addition to attending class. Students will need to provide their own transportation.

ENG 459 Seminar in Film Studies 3.
Prerequisite: ENG 282, ENG 384 and Junior or Senior standing.
Advanced critical approaches to focused film topics involving film genres, directories styles, or trends within a national cinema. This seminar-style course will include screenings, readings, regular discussions, and a substantive final research paper. Topics will vary from semester to semester. Junior or senior standing or permission of instructor required.

ENG 460 Major British Author 3.
Prerequisite: Sophomore standing and above.
In-depth study of the works of one (or two) British author(s) within their historical and literary-historical context. Sample authors might include; Spencer and Sidney, Swift and Pope, Austen, Wordsworth and Coleridge, Keats and Shelley, the Brontes, the Brownings, Dickens, George Eliot, Hardy, Joyce, Woolf.

ENG 462 18th-Century English Literature 3.
Prerequisite: Sophomore standing and above.
Major figures in English literature between 1660 and 1790. Works studied in relation to social, cultural, political, and religious developments. Emphasis on writers such as Dryden, Swift, Pope, Johnson.

ENG 463 The Victorian Period 3.
Prerequisite: Sophomore standing and above.
Significant British poets, writers of prose non-fiction, and novelists studied in the social, economic, scientific, intellectual, and theological contexts of the Victorian era.

ENG 464 British Literature, 1900-1945 3.
Prerequisite: Sophomore standing and above.
Variety of writings by British authors between the death of Queen Victoria and the end of World War II. Typical subjects: Hardy, Conrad, Shaw, Yeats, Forster, Joyce, Lawrence, Eliot, Woolf, Beckett.

ENG 465 British Literature, Since 1945 3.
Prerequisite: Sophomore standing and above.
Study of a variety of writings by British authors since World War II. Typical subjects: Beckett, O'Brien, Orwell, Lessing, Murdoch, Rhys, Auden, Larkin, Osborne, Rushdie.

ENG 467 American Colonial Literature 3.
Prerequisite: Sophomore standing and above.
Survey of American literature and thought from its beginnings to the adoption of the Constitution. Representative works such as travel and exploration reports, Indian captivity narratives, diaries, journals, autobiographies, sermons, and poetry.

ENG 468 American Romantics 3.
Prerequisite: Sophomore standing and above.
Major American writers from 1825 to 1865. Relationship between literary developments and social change. Emphasis on such writers as Emerson, Hawthorne, Cooper, Poe, Melville, Douglass, Stowe, Thoreau, and Whitman.

ENG 469 American Realism and Naturalism 3.
Prerequisite: Sophomore standing and above.
Major American writers from 1865 to 1914, with emphasis on novelists such as Twain, James, Howells, Chopin, and Dreiser.

ENG 470 American Literature, 1914-1945 3.
Prerequisite: Sophomore standing and above.

ENG 471 American Literature, Since 1945 3.
Prerequisite: Sophomore standing and above.
Study of a variety of writings by U.S. authors since World War II. Typical subjects: Eliison, Lowell, Williams, Welty, Bellow, Baldwin, O'Connor, Barthelme, Albee, Mailer, Ashbery, Morrisom, McDermott, DeLillo.

ENG 475 Literature, the Arts, and Mass Culture 3.
A review of the debate regarding art and mass culture, with attention to recent developments in cultural theory and practice.

ENG 476 Southern Literature 3.
Prerequisite: Sophomore standing and above.
Literary traditions of the Southeastern United States from colonization through the present, including study of such major writers as Byrd, Jefferson, Simms, Poe, Douglas, Twain, Chesnutt, Glassow, Hurston, Tate, Wolfe, Faulkner, Warren, Wright, Welty, Williams, O'Connor, Percy, and Lee Smith.

ENG 480 Modern Drama 3.

ENG 486 Shakespeare, The Earlier Plays 3.
Prerequisite: Sophomore standing and above.
Shakespeare's major works before 1600 with emphasis on his development as a playwright.

ENG 487 Shakespeare, The Later Plays 3.
Prerequisite: Sophomore standing and above.
Shakespeare's major works after 1600 with emphasis on his tragedies and the late romances.
ENG 488 Advanced Fiction Writing Workshop 3.
Prerequisite: ENG 388.
An advanced workshop in creative writing for students with demonstrated understanding and accomplishment in the techniques of writing prose fiction. This course is restricted to juniors and seniors. Departmental approval required.

ENG 489 Advanced Poetry Writing Workshop 3.
Prerequisite: ENG 389.
An advanced workshop in creative writing for the students with demonstrated understanding and accomplishment in the techniques of writing poetry. This course is restricted to juniors and seniors. Departmental approval required.

ENG 490 Studies in Medieval Literature 3.
Prerequisite: Sophomore standing and above.
Topics (in rotation) in medieval English and continental literature, such as Arthurian legend and literature; women in medieval society and literature; the self in the late Middle Ages. Focus on special areas of interest, with attention to cultural and historical backgrounds and contemporary scholarship. Some texts in Middle English, some in translation; no prior knowledge of Middle English needed.

ENG 491 Honors in English 3.
Requisite: English Majors Only.
Intensive course or independent study project designed as one portion of the Honors Program in English. Subject varies.

ENG 492 Special Topics in Film Styles and Genres 3.
Critical approaches to focused film topics involving film genres, directorial styles, or trends within a national cinema. Topics will vary from semester to semester.

ENG 494 Special Topics in Linguistics 3.
Prerequisite: ENG 101.
(May be repeated for credit with new topic.) Methodology and analysis within various branches of linguistics, e.g., syntax, semantics, computational linguistics, phonology, dialectology, historical linguistics, discourse analysis. Examination of topic's basic methods, controversial issues, analysis of linguistic data. Projects may include novel analyses of English constructions, parsing programs, field work reports.

ENG 496 Seminar in Literary Criticism 3.
Prerequisite: 9 hours of literature at the 300 level or above.
Introduction to theoretical and applied criticism of literature, primarily for English majors and minors. May include traditional theory from Plato and Aristotle to New Criticism, as well as contemporary psychoanalytical, social, historical, and linguistic approaches to literature.

ENG 497 Senior Seminar in World Literature 3.
Prerequisite: Junior standing or Senior standing.
Rotating topics in world literature, including treatment of materials from more than one culture and including consideration of the subject's theoretical or methodological framework. Readings in English (original languages encouraged but not required).

ENG 498 Special Topics in English 1-6.
Prerequisite: Six hours in ENG above the 100 level.
Directed individual study or experimental course offerings in language or literature. Individual study arranged through consultation with faculty member and Director of Undergraduate Studies.

ENG 499 Special Topics in Creative Writing 3.
Prerequisite: ENG 288 or ENG 289; Students must have earned a grade of B or better in 288 or 289 or they must have demonstrated competence in creative writing as determined by instructor.
Techniques and practice in writing a particular form within the traditional genres of poetry, prose, or drama, such as "Creative Non-Fiction," "Science Fiction," "The Novella," or "The Satirical Poem." Topics vary from semester to semester.

ENG 506 Verbal Data Analysis 3.
Prerequisite: ENG 517.
Research strategies for understanding how spoken and written language shapes activities (e.g., design, instruction, counseling, gaming interactions, e-commerce, etc.). Tracking patterns of language as verbal data (e.g., grammatically topically, thematically), formulating research questions, and designing studies to answer those questions through quantitative descriptive means. Sampling, collecting, and managing data, developing coding schemes, achieving reliability, using descriptive statistical measures, and reporting the results.

ENG 507 Writing for Health and Environmental Sciences 3.
Prerequisite: Graduate standing, Doctoral student, Master's student.
Readings, on-site research, document gathering, and analysis of writing in health and environmental science fields. Students study, practice, and present major forms of writing in their profession. Professional portfolio due at the end of the semester. Intended for students interested in exploring or pursuing writing careers in medicine, pharmaceuticals, nutrition, agriculture, ecology, or other health and environmental science-related industries, or professionals who wish to improve knowledge and skills.

ENG 508 Usability Studies for Technical Communication 3.
Prerequisite: ENG 517.
Advanced study of usability inspection, inquiry, and testing theories and practices related to instrumental and instructive texts (i.e., computer-related, legal, medical, pharmaceutical, financial, etc.). Practical experience testing a variety of texts using several testing methods, including completion of a substantial, lab-based usability test. For students planning careers in technical communication, human factors, software design, and multimedia design.

ENG 509 Old English Literature 3.
Study of Old English language with selections from important poems including Beowulf. Examination of the poetry in the light of various modern critical approaches.

ENG 510 Middle English Literature 3.
Study of major works of medieval English literature (exclusive of Chaucer's Canterbury Tales) in historical context, as reflections of and influences on social and cultural change. Includes works such as Sir Gawain and the Green Knight, Pearl, Langland's Piers Plowman and Malory's Morte d'Arthur.

ENG 511 Theory and Research In Composition 3.
Research and scholarship in composition and the teaching of writing. Major theoretical perspectives (such as expressive, social, cognitive, feminist), current issues (such as audience, invention, revision, evaluation) and various research methods.

ENG 512 Theory and Research In Professional Writing 3.
Corequisite: ENG 666.
Introduction to research and scholarship in professional writing and writing in the workplace. Major theoretical perspectives for studying writing; current issues (such as usability, readability, collaboration, gender, authorship); and various research methods.
ENG 513 Empirical Research In Composition 3.
Reading and evaluation of empirical research in written composition; guided practice in qualitative and quantitative methods. Basic principles of research; problem definition, research design and statistical analysis, description and assessment of written products and processes.

ENG 514 History Of Rhetoric 3.
Historical development of rhetorical theory with attention to contemporaneous rhetorical practice and philosophical trends. Major focus on the classical period with briefer coverage of medieval, Renaissance, 18th-century, and 19th-century developments. Implications for contemporary theory and practice, including pedagogical practice.

ENG 515 Rhetoric Of Science and Technology 3.
The relationships among rhetoric, scientific knowledge and technological development and of changes in how these relationships understood historically. Practice in critical analysis of scientific and technical discourse. Consideration of scientific and technical language and of public controversy concerning science and technology.

ENG 516 Rhetorical Criticism: Theory and Practice 3.
Prerequisite: Graduate Standing or the equivalent of COM/ENG 321 or COM/ENG 411.
Development, achievements, limitation of major critical methods in the 20th century, including neo-Aristotelian, generic, metaphoric, dramatistic, feminist, social-movement, fantasy-theme and postmodern approaches. Criticism of political discourse, institutional discourse, discourses of law, medicine, religion, education, science, the media. Relations between rhetorical and literary criticism and other forms of cultural analysis.

ENG 517 Advanced Technical Writing, Editing and Document Design 3.
Prerequisite: ENG 314.
Advanced study of document design, technical editing and usability. For students planning careers as technical communicators.

ENG 518 Publication Management for Technical Communicators 3.
Prerequisite: ENG 517.
Advanced study of publication and team management issues such as staffing, scheduling, cost-reduction and subcontracting. For students planning careers as technical communicators.

ENG 519 Online Information Design and Evaluation 3.
Prerequisite: ENG 517.
Concepts and practices related to multimedia information design, information architectures, human-computer interaction, and genre for complex websites.

ENG 520 Science Writing for the Media 3.
Coverage of three areas: how to write science articles for a variety of mass media, how to think critically about how mass media cover science, and how to think critically about science itself. Preparation for careers not only in mass media, but also in scientific and technological organizations.

ENG 522 Writing in Nonacademic Settings 3.
Directed work experience for English Department graduate students including work-site mentoring and evaluation and concurrent academic assignments. Academic component includes reading and discussing articles relevant to the day-to-day practice of writing in nonacademic settings and completion of a project that connects academic and nonacademic components. Graduate Standing in an English Department graduate program required. Modest liability insurance fee required. Students must provide their own transportation to the practicum site.

ENG 523 Language Variation Research Seminar 3.
Prerequisite: ENG 525.
Field-initiated research. Group and individual research topics focused on current sociolinguistic issues related to language variation and changes. Ethnographic and quantitative methods of analysis.

ENG 524 Introduction to Linguistics 3.
Prerequisite: Graduate standing or 12 hrs. in ENG.
Introduction to theoretical linguistics, especially for students in language, writing and literature curricula. Phonology, syntax, semantics, history of linguistics; relation of linguistics to philosophy, sociology and psychology; application of theory to analysis of texts.

ENG 525 Variety In Language 3.
Prerequisite: Graduate standing or 12 hrs. in ENG.
Language variation description, theory, method and application; focus on regional, social, ethnic and gender varieties; sociolinguistic analysis, basic discourse analysis.

ENG 527 Discourse Analysis 3.
Prerequisite: Graduate standing.
Overview of major issues, theories, and research methods in contemporary discourse analysis. It explores how language as a form of social practice regulates social actions, relations and identities; how ways of speaking construct and are constructed by social order, cultural practice, and individual agency. Texts/discourses are analyzed to examine how speakers create meaning through formal linguistic choices; what the micro-organization of talk reveals about social order; how critical understanding of discourse helps to interpret complex processes of social life.

ENG 528 Sociophonetics 3.
A survey of sociophonetics: the study of language variation using modern phonetic techniques. Acoustic analysis of consonants, vowels, prosody, voice quality. Speech perception experiments and how they can be applied to a variety of issues. Applications to theoretical issues in sound change, sociolinguistics, phonetics and phonology, and cognition of language. Graduate standing required.

ENG 529 16th-Century Non-Dramatic English Literature 3.
Prerequisite: Graduate standing.
Prose and poetry of the English Renaissance, excluding drama. Special attention to major authors, including Spenser and Sidney, and to intellectual, cultural and literary backgrounds and developments. Introduction to pertinent methods and issues of scholarly inquiry and critical interpretation.

ENG 530 17th-Century English Literature 3.
A close examination of the literature of England from 1600 to 1660 with emphasis on major literary figures and movements, development of important literary forms and genres and relationship between literary texts of this period and their philosophical, political and theological contexts. Some bibliographical and textural assignments. Content and focus varies according to instructor's emphasis, but writers covered usually include Donne, Herbert, Crashaw, Marvell and Browne.

ENG 531 American Colonial Literature 3.
Survey of American literature and thought from the beginning to adoption of the constitution. Representative works such as travel and exploration reports, Indian captivity narratives, diaries, journals, auto biographies, sermons and poetry.

ENG 532 Narrative Analysis 3.
Prerequisite: Graduate standing.
Introduction to theories concerning the structure, use, and interpretation of narratively organized discourse; application of methods of narrative analysis to both spoken and written narratives.
ENG 533 Bilingualism and Language Contact 3.
Linguistic, cultural and socio-political aspects of bi- and multilingualism in a global context. Issues and implications of bilingualism from both theoretical and practical perspectives. Topics include: language maintenance and shift; child and adult bilingualism; relationship between language, culture and identity in bi- and multilingual situations; psycholinguistic aspects and linguistic outcomes of bilingual contact, such as code-switching, convergence and language attrition; language ideology, the politics of language choice and language policy; globalization and intercultural communication. Must hold graduate standing or get consent of instructor for advanced undergraduate students.

ENG 534 Quantitative Analysis on Sociolinguistics 3.
Prerequisite: ENG 523.
The quantitative methods specific to sociolinguistic variation are examined in detail, focusing both on gaining experience using quantitative analysis software and on understanding fundamental concepts underlying the quantitative analysis of language variation. This course takes students beyond the basic familiarly with quantitative analysis gained in ENG 523, both in depth of investigation and in attention to the link between method and theory.

ENG 536 Research Methods in Phonology 3.
Requisite: Enrollment in the Sociolinguistics concentrations of the MA English or PhD Sociology programs or permission of instructor.
This course explores laboratory and computational tools for investigating linguistic sound systems (e.g., speech perception experiments, speech production tools such as ultrasound imaging, and computational tools such as automated transcription and acoustic measurement). Requires enrollment in the Sociolinguistics MA or PhD program or permission of instructor.

ENG 539 Seminar In World Literature 3.
Rotating topics in world literature, including treatment of the subject's theoretical or methodological framework. Possible subjects: colonialism and literature; orality and literature; the Renaissance; the Enlightenment; translation; comparison of North and South American literatures; African literature traditions; post-modernism and gender. Readings in English (original languages encouraged but not required).

ENG 540 History Of Literary Criticism 3.
Prerequisite: Graduate standing or PBS status.

ENG 541 Literary and Cultural Theory 3.
A survey of literary theory in the 20th century from New Criticism to postmodernism. Examines the virtues and pitfalls of these approaches to the study of culture and literature. A course on issues, concepts, theorists and the sociohistorical and political context in which the theorists are writing. Taught in English. No formal pre-requisites. However, students who have not had advanced literature will be disadvantaged.

ENG 548 African-American Literature 3.
Prerequisite: Grad. standing.
Advanced study of critical theories of African-American literature, the contexts of cultural criticism and 20th-century novels of African-American writers within these frames.

ENG 549 Modern African Literature 3.
The works of the most important writers shaping modern African literature in English (and English translation). Selections from East, West, North and South Africa, spanning colonial through post-colonial Africa--from literature of protest and culture conflict to that of disillusionment, reappraisal and feminism.

ENG 550 English Romantic Period 3.
A detailed study of the six major romantic poets--Blake, Wordsworth, Coleridge, Byron, Shelley, and Keats; some attention as well to the political, social and literary background and to a few minor writers and critics.

ENG 551 Chaucer 3.
Prerequisite: ENG 451, Graduate standing.
Intensive study of the works of Chaucer in the light of medieval literary traditions, medieval history and a variety of medieval and modern critical approaches.

ENG 554 Contemporary Rhetorical Theory 3.
Contemporary rhetorical theory covering the 20th and 21st centuries. Conceptual connections with and disruptions of the classical tradition and its successors; relationship between rhetorical theory and philosophical trends, institutional histories, socioeconomic circumstances, and pedagogical needs. Attention to current issues such as the revival of invention, rhetorical agency, and ethics.

ENG 555 American Romantic Period 3.
The literary culture of the United States from 1820s through 1860s, setting works of transcendentalists and other romantic writers within sociohistorical contexts. Consideration of writing by women, slave narratives and popular fiction as well as such major figures as Emerson, Hawthorne, Thoreau and Melville.

ENG 558 Studies In Shakespeare 3.
An intensive study of a particular phase of the Shakespeare canon. Emphasis will normally be on one dramatic genre (tragedy, comedy, history), but occasionally the focus may be more limited.

ENG 560 Victorian Poetry and Critical Prose 3.
The literature of Victorian England: 1837-1901; the major poets and essayists, movements and questions in their historical contexts, religious, political and aesthetic.

ENG 561 Milton 3.
An intensive reading of Milton with attention to background materials in history and culture of seventeenth-century England.

ENG 562 18TH-Century English Literature 3.
British writers of the period 1600-1790 studied in historical and cultural contexts. Usually includes works by Dryden, Swift, Pope, Defoe, Mandeville, Boswell and Johnson, but addition of other significant writers possible.

ENG 563 18TH-Century English Novel 3.
Selected British novels of the Restoration and eighteenth century from a variety of contemporary critical perspectives. Such writers as Fielding, Richardson, Sterne, Burney, Smollett and Austen.

ENG 564 Victorian Novel 3.
Study of selected British novels published between 1837 and 1901 in contexts of the development of the genre, historical period and current literary theory. Such writers as Dickens, Thackeray, Bronte, Trollope, Eliot, Meredith and Hardy.
ENG 565 American Realism and Naturalism 3.
Study of literary culture of United States from 1860s to early 1900s with
emphasis on fiction by such realists and naturalists as Twain, Howells,
Chesnutt, James, Crane, Wharton, Dreiser and Norris. Inclusion of prose of
writers such as Adams and DuBois possible.

ENG 570 20TH-Century British Prose 3.
Examination of British fiction of this century and relationship of significant
intellectual, historical and political issues. Inclusion of such writers as Joyce,
Conrad, Woolf, Lawrence, Beckett and Murdoch possible but also
post-colonial novelists as well.

ENG 571 20TH-Century British Poetry 3.
Development of English poetry from its late Victorian phase through
Modernism to present post-war scene. Inclusion of such writers as Hardy,
Yeats, Eliot, Smith, Auden, Larkin, Heaney, Wolcott and Hill possible.

ENG 572 Modern British Drama 3.
Survey of modern British drama from its beginnings at turn of the century to
present.

ENG 573 Modern American Drama 3.
A survey of modern American drama centering on major figures.

ENG 575 Southern Writers 3.
Introduction to literary culture of "the South," tracing the roots of the
twentieth-century "Southern Renaissance" in such ante-bellum genres as
plantation fiction, Southern humor, fugitive-slave narration and pastoral elegy. Examination of persistence of "Southern" writing within
increasingly standardized culture of the United States.

Development of modern American poetry from rebellion against the
romantic and genteel verse of the 1890's; special attention to Robinson,
Frost, Pound, Williams, Stevens and Ransom.

ENG 577 20th-Century American Prose 3.
An examination of representative American writers of novel and short
fiction.

ENG 578 English Drama To 1642 3.
Prerequisite: ENG 261 and upper division or Graduate standing.
Elizabethan and Jacobean drama from 1580 to 1642, excluding
Shakespeare. Coverage of such writers as Marlowe, Jonson, Webster,
Beaumont and Fletcher, Heywood, Tourneur and Ford.

ENG 579 Restoration and 18th-Century Drama 3.
Representative British plays of the period 1660-1780 studied in cultural,
social and ethical contexts. Usually includes works by Etherege,
Wycherley, Behn, Dryden, Otway, Vanbrugh, Farquhar, Congreve, Lillo,
Gay, Goldsmith and Sheridan.

ENG 580 Literary Postmodernism 3.
Prerequisite: Graduate standing.
Post-1945 literary theory in relationship with representative avant-garde
writers. Theoretical and argumentative essays in such areas as chaos
theory, deconstruction, feminism and the limits of fiction. Fiction readings by Calvino, Pynchon, Barthelme, Cortazar and others.

R: Graduate Students Only.
Application of visual theory to rhetoric and of rhetorical theory to
visual forms of communication. Discussion and analysis may include
advertising, photography, news and informational media, political
communication, instructional material, scientific visualization, visual arts,
public commemorative artifacts, internet and other digital media.

ENG 582 Studies in Literature 3.
Prerequisite: Graduate standing.
Variation in content. Selected problems and issues in literature.

ENG 583 Studies In Composition and Rhetoric 3.
Prerequisite: Graduate standing.
Variation in content. Selected problems and issues in composition and
rhetoric.

ENG 584 Studies In Linguistics 3.
Prerequisite: Graduate standing.
Variation in content. Selected problems and issues in linguistics.

ENG 585 Studies In Film 3.
Prerequisite: Graduate standing.
Variation in content. Selected problems and issues in film.

ENG 586 Studies In Theory 3.
Prerequisite: Graduate standing.
Variation in content. Selected problems and issues in theory.

ENG 587 Interdisciplinary Studies in English 3.
Content varies. Selected topics and issues that cross disciplinary
boundaries in English Studies. May be repeated for credit with different
topics. Graduate standing is required.

ENG 588 Fiction Writing Workshop 3.
Prerequisite: ENG 488 or ENG 489.
Advanced work in techniques of writing fiction for students with
substantial experience in writing. Workshop sessions with students
commenting on each other's work.

ENG 589 Poetry Writing Workshop 3.
Prerequisite: ENG 488 or ENG 489.
Advanced work in techniques of writing poetry for students with
substantial experience in writing. Workshop sessions with students
commenting on each other's work.

ENG 590 Studies In Creative Writing 3.
Prerequisite: ENG 588 or 589.
Techniques special to a particular kind of writing within the traditional
genres of prose, poetry or drama, such as "Speculative Fiction" or "The
Long Poem or Poetic Sequence." Various subjects.

ENG 591 Studies in National Cinemas 3.
Aesthetic developments and historical importance of national cinema
traditions in specific cultural contexts. Focus on the relation between
cinema and linguistic, literary and artistic developments within a national
setting or in regional or international contexts. Topics, which change each
year, may include Italian Neorealism, French New Wave, and British
Social Realism.

ENG 592 Special Topics in Film Styles and Genres 3.
Critical approaches to focused film topics involving film genres, directorial
styles, or trends within a national cinema. Topics will vary from semester
to semester. Students cannot obtain credit for both ENG 492 and
ENG 592.

ENG 610 Special Topics English 1-6.

ENG 624 Teaching College Composition 3.
Prerequisite: ENG 511 and mentored assistantship in ENG 101.
Preparation for teaching college composition. Introduction to pedagogical
principles and practices. Practice in setting course goals, designing
writing assignments to meet those goals, developing instructional
activities to support assignments, and evaluating student writing. The
course is scheduled as a 5-day workshop before classes begin, followed
by weekly meetings and mentoring during the fall semester.
ENG 626 Advanced Writing for Empirical Research 3.
Prerequisite: Graduate standing.
A seminar and workshop for graduate students in empirical research fields working on grant proposals, theses and dissertations, papers for professional journals, conference proposals, and other significant research texts. Intensive practice and feedback on writing, grounded in an introduction to theory and research on writing processes, products, and contexts. Requirements include three major writing projects designed by the student, review and discussion of drafts written by other workshop members, analysis and presentation of discipline-specific communication patterns and practices.

ENG 636 Directed Readings 1-6.
Prerequisite: Graduate standing.
Intensive study of a specific topic from various specializations of the English faculty. Negotiation between the student and the director for variable credit and approved by Director of Graduate Studies.

ENG 669 Bibliography and Methodology 1-3.
Intensive study of the bibliography and methodology of literary research.
Required of all graduate students in English.

ENG 675 Projects in Technical Communication 3.
Prerequisite: ENG 518.
Capstone course for M.S. in Technical Communication. Students engage in major semester-long individual project under direction of instructor.

ENG 676 Master’s Project in English 3.
Individual capstone project in English Studies. Topic and mode of study determined in consultation with faculty project advisor. For students in the final semester of the English MA program.

ENG 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ENG 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master’s exam, etc.

ENG 690 Master’s Examination 1-9.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all other requirements of the degree except preparing for and taking the final master’s exam.

ENG 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

ENG 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

ENG 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

ENG 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their theses.

ENG 722 Linguistics and Literacy 3.
Prerequisite: ENG 525.
Focus on two-way relationship between linguistic theory and literacy. Metalinguistic awareness and acquisition of literacy, orthography and phonology, oral vs. written language, oral vs. literate cultures, and metalinguistic assumptions in linguistic theory.

ENG 727 Discourse Analysis 3.
Overview of major issues, theories, and research methods in contemporary discourse analysis. It explores how language as a form of social practice regulates social actions, relations and identities; how ways of speaking construct and are constructed by social order, cultural practice, and individual agency. Texts/discourses are analyzed to examine how speakers create meaning through formal linguistic choices; what the micro-organization of talk reveals about social order; how critical understanding of discourse helps to interpret complex processes of social life.

ENG 729 Language Variation and Social Theory 3.
Prerequisite: ENG 523.
Although the field of sociolinguistic variation has developed its own body of theory, its central questions continue to call for engagement with theory in related socio-cultural disciplines. This course examines sociolinguists’ explicit and implicit incorporation of social theory into the analysis of language variation; it also explores the many ways in which social theory could yet enrich, and be enriched by, empirical sociolinguistic analysis.

ENG 730 Ethnolinguistic Variation 3.
Prerequisite: ENG 525.
This course examines the nature of ethnolinguistic variation in the English-speaking diaspora, with particular attention to the ethnic varieties in the United States, including African American English, Hispanic English, and Native American English.

ENG 731 Applied Sociolinguistics 3.
Prerequisite: ENG 525.
This course will introduce the main research concentrations and methods in Applied Sociolinguistics, including first language acquisition and teaching, second language learning, bilingualism, and clinical assessment and treatment of communication disorders. Students will be introduced to the basic foundations of language variation from linguistic and sociocultural/historical perspectives and learn how sociolinguistic variation affects clinical and educational processes and organizations.

ENG 798 Special Topics in English Studies 3.
Intensive exploration of specialized or emerging topics in an area of language, literature, rhetoric, film, or other aspect of English studies. Emphasis on student research and writing. May be used to test and develop new courses. May be repeated for credit.

ENG 810 Directed Readings in English Studies 1-6.
Intensive study of a specific topic from various specializations of the English faculty. Negotiation between the student and the director for the variable credit and approved by the director of Graduate Studies. May be repeated for credit.

ENG 896 Summer Dissertation Research 1.

Entomology (ENT)
ENT - Entomology Courses

ENT 110 General Entomology 3.
Considers how insects live, their internal and external structures and their functions, classification and identification and control when desirable. Recognition of economically important beneficial and destructive insects and mites occurring in North Carolina and neighboring states, stressing information on their life histories, damage and control.

ENT 121 Pesticides and Their Utilization 3.
Basic characterization, classification, chemical and physical properties of pesticides. Use of pesticides including environmental effects; Federal and State laws and regulations relating to their manufacture, distribution and use; safety procedures including handling and storage; and application equipment including types, calibration, use and maintenance. TOTH.

ENT 132 Urban Pest Management 3.
AGI Students Only.
Insects and related arthropods found in residential and industrial buildings, nature of damage, and their control. Identification and life history of the different pest species, methods to detect their presence, and integrated pest management strategies. Hands-on learning of species in laboratory with emphasis on current control techniques. Field trips required. Agricultural Institute Students only.

ENT 163 Ornamental & Turf Insects 3.
Practical course in the biology, recognition, and management of common insect and related arthropod pests that attack ornamentals and turf. WALDVOGEL.

ENT 190 Current Topics in Pest Management 1.
Discussions of current topics of pest management. Topics selected by the students and instructors to include different phases of pest management. Discussions led by leaders in the various facets of the industry.

ENT 201 Insects and People 3.
Introduction to the fascinating world of insects and how they interact with people. Survey of insect history, diversity, structure and function, and behavior. Examples of harmful and beneficial insects in a variety of human activities concluding with some profound impacts insects have had on history, society and culture.

ENT 203 An Introduction to the Honey Bee and Beekeeping 3.
Introduction to honey bee biology and a fundamental understanding of beekeeping management including crop pollination by bees. Examination of the relationships between honey bees and humans from prehistoric through modern times and the behavior and social system of one of the animal world's most complex and highly organized non-human societies.

ENT 207 Insects and Human Disease 3.
This course is an introduction to the many interactions between insects, other arthropods and humans that result in disease, ranging from simple anxiety, phobias, discomfort and pain, to transmission of pathogenic organisms causing sickness and even death. Included will be an understanding of the special physical and chemical adaptations of insects that enable them to cause us harm. The major groups of insects, mites, ticks and related arthropods associated with human suffering and disease as well as an introduction to the diseases transmitted by them will be presented. Finally, the course will present information on how major outbreaks of disease transmitted by the insects have influenced human populations, demographics, warfare, religion, and societal structure throughout recorded history.

ENT 212 Basic Entomology 1.
This course offers a brief and basic introduction to the world of insects and the discipline of entomology. It is intended as a primer for several other more specialized entomology classes such as forensic entomology and forest entomology.

ENT 305 Introduction to Forensic Entomology 3.
This course provides a broad overview of forensic entomology - a specialized field of entomology employed in medico-criminal investigations. Forensic entomology relies on knowledge of insect ecology, biology, taxonomy, physiology and development to elucidate the circumstances surrounding death. The role of arthropods associated with decomposed human remains is one of several valued disciplines in forensic sciences. Understanding the general principles of forensic entomology and their application will be the focus of this course.

ENT 401 Honey Bee Biology and Management 3.
Prerequisite: (ENT 201, ENT 203, ENT 425, BIO 105 or PB 200).
A hands-on course in honey bee management including bee pollination of selected crops based on an understanding of bee behavior, bee behavior, bee pathology, and bee botany. Students must be able to provide their transportation to field sites or arrange to work with a beekeeping mentor. Students may choose, but are not required, to purchase their own beekeeping equipment and hive.

ENT 402 Forest Entomology 3.
Prerequisite: Junior standing.
Fundamentals of morphology, classification, biology, ecology and control of insects attacking trees, with emphasis on silvicultural practices.

ENT 425 General Entomology 3.
Prerequisite: BIO 181 or BIO 140 or BIO 350.
Explores the science of entomology by focusing on the basic principles of systematics, morphology, physiology, development, behavior, ecology, and control of insects. Field trips provide opportunities to collect insects and study their adaptations to a wide variety of natural environments.

ENT 470 Advanced Turfgrass Pest Management 2.
Prerequisite: C- or better in CS 200.
Characteristics and ecology of turfgrass weed, insect, and disease pests; identification and diagnosis of turfgrass pests, strategies for managing pests including cultural, mechanical, biological, and chemical methods; development of integrated pest management programs, characteristics and modes of action for herbicides, insecticides, fungicides, and plant growth regulators; behavior and fate of pesticides in soil; and the development and management of pesticide resistant pest populations.

ENT 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

ENT 493 Special Problems in Entomology 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.
ENT 495 Special Topics in Entomology 1-3.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

ENT 502 Insect Diversity 4.
Prerequisite: ENT 425 or Graduate Standing.
Diversity of insect biology and structure with emphasis upon identification of adults; includes speciation, evolutionary relationships, approaches to classification, nomenclature, zoogeography and techniques of collection.

ENT 503 Insect Morphology and Physiology 3.
Prerequisite: (CH 221 or CH 225) and (CH 223 or CH 227) and ENT 425 or Graduate Standing.
The objectives are to acquaint students with the internal morphology, histology, and ultra-structure and system functions of insects. The laboratory will assist in recognizing the internal anatomy and associated external structure of insects and provide practical experience in the study of insect function.

ENT 504 Professional Development for Entomologists 2.
A successful professional career in entomology is not limited to understanding just the science of Entomology. Also required is an understanding of career paths, professional ethics, written and verbal communication, safety, how to work with animals and human subjects, personal interactions, vita preparation, networking, and future directions of the discipline. These skills are essential to taking the knowledge obtained in entomology and applying them to a career in the discipline. Graduate Standing required.

ENT 506 Principles of Genetic Pest Management 3.
Introduction to the biological aspects of genetic pest management (GPM). Genetic techniques for GPM, including historical uses (such as the sterile insect technique) and approaches that are currently in development. Practical issues relating to the deployment of GPM, including ecological and economic considerations.

ENT 509 Biology of Aquatic Insects 3.
Prerequisite: ENT 425 or Graduate standing.
Life history descriptions and identification of aquatic insects. Emphasis on behavioral and physiological adaptations to diverse habitats and the role of insects in aquatic ecosystem function and as indicators of water quality.

ENT 520 Insect Behavior 3.
This course stresses comprehensive coverage of the principles of animal behavior using insects as models and examples. Physiology, genetics, mechanisms, behavioral ecology, and evolution of insect behavior will be covered.

ENT 525 Entomology for Educators 3.
Prerequisite: General Biology.
Insects and other arthropods used as paradigms for teaching basic principles of Biology and Ecology. Project-oriented format covering topics embracing the learning cycle, scientific method, critical thinking skills, and hand-on laboratory activities.

This is a multidisciplinary class, and lectures cover many aspects of organic production given by a number of experts from both on and off campus. Classes also include discussions of issues and controversies surrounding organic production, as well as field trips to selected farms. This course is restricted to upper level undergraduate, graduate, or post-baccalaureate continuing education students.

Prerequisite: ENT 425 or Graduate Standing.
The principles underlying modern methods for protecting food, clothing, shelter and health from insect attack.

ENT 560 Techniques in Molecular Ecology and Evolution 3.
Laboratory-intensive course providing hands-on experience in application of several commonly used techniques in molecular ecology and evolution. Lectures cover theory and application of specific techniques in the context of case studies from the primary literature. By end of course, students should be comfortable with theory and application of molecular markers in studies of ecology and evolution, and should be able to incorporate one or more techniques into their thesis research. Graduate standing or permission of the instructors required.

ENT 582 Medical and Veterinary Entomology 3.
Prerequisite: ENT 425 or Graduate standing.
The morphology, taxonomy, biology and control of the arthropod parasites and disease vectors of man and animals. The ecology and behavior of vectors in relation to disease transmission and control.

ENT 591 Special Topics In Entomology 1-6.
Prerequisite: Graduate standing.
A variable credit lecture and laboratory series offering topics such as advanced beekeeping, morphology, physiology, systematics, behavior, biological control, nursery and ornamental pests, plant resistance, information retrieval, biological monitoring and sampling, population modeling, extension entomology, computer methods and urban, forest and stored product pests.

ENT 601 Seminar 1.
Prerequisite: Graduate standing in ENT or closely allied fields.
Discussion of entomological topics selected and assigned by seminar chair.

ENT 604 Insect Natural History and Field Ecology 1.
Prerequisite: Graduate standing in Entomology.
Diversity of ecological roles and lifestyles of insects and related arthropods using techniques in field ecology. Two-week-long field trips to Coastal Plain and Mountains with orientation walks, evening lectures, and field projects. Taught during the two weeks prior to the Fall semester.

ENT 620 Special Problems 1-6.
Original research on special problems in entomology not related to a thesis problem. Provides experience and training in research. Credits Arranged.

ENT 641 Agricultural Entomology Practicum 3.
Prerequisite: Economic entomology (ENT 762 recommended).
Practical experience in research, extension and commercial aspects of insect pest management on a broad range of agricultural crops under actual field conditions. Class meets 9 hours each Friday for 10 weeks from early June to mid-August. Students should register for second summer session.

ENT 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ENT 690 Master’s Examination 1-9.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all other requirements of the degree except preparing for and taking the final master’s exam.
ENT 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

ENT 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

ENT 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

ENT 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their theses.

ENT 726 Biological Control of Insects and Weeds 3.
Prerequisite: ENT 425 or Graduate Standing.
Overview of the field of biological control and its role in Integrated Pest Management programs. Emphasis on the diversity and sometimes unusual interactions of insect parasitoids and predators with their hosts/ preys, controversies in biological control, critical analysis of selected projects, and basic conceptual and “hands-on” tools for approaching biological control research and implementing projects.

ENT 731 Insect Ecology 3.
Prerequisite: ENT 425 or Graduate standing.
The interrelationships among insects and components of their effective environments which result in dynamic spatial and temporal patterns of particular species. Also, the diverse roles of insects in structure and function of communities and ecosystems.

ENT 762 Insect Pest Management In Agricultural Crops 3.
Prerequisite: Graduate Standing.
Critical review of the biology and ecology of representative beneficial and injurious insects and arachnids of agricultural crops and the advantages and limitations of advanced concepts of their management in selected agroecosystems.

ENT 791 Special Topics In Entomology 1-6.
Prerequisite: Graduate standing.
A variable credit lecture and laboratory series offering topics such as advanced beekeeping, morphology, physiology, systematics, behavior, biological control, nursery and ornamental pests, host plant resistance, information retrieval, biological monitoring and sampling, population modelling, extension entomology, computer methods and urban, forest and stored product pests.

ENT 801 Seminar 1.
Prerequisite: Graduate standing in ENT or closely allied fields.
Discussion of entomological topics selected and assigned by seminar chair.

ENT 804 Insect Natural History and Field Ecology 1.
Prerequisite: Graduate standing in Entomology.
Diversity of ecological roles and lifestyles of insects and related arthropods using techniques in field ecology. Two week-long field trips to Coastal Plain and Mountains with orientation walks, evening lectures, and field projects. Taught during the two weeks prior to the Fall semester.

ENT 820 Special Problems 1-6.
Original research on special problems in entomology not related to a thesis problem. Provides experience and training in research.

ENT 841 Agricultural Entomology Practicum 3.
Prerequisite: Economic entomology (ENT 762 recommended).
Practical experience in research, extension and commercial aspects of insect pest management on a broad range of agricultural crops under actual field conditions. Class meets 9 hours each Friday for 10 weeks from early June to mid-August. Students should register for second summer session.

ENT 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ENT 890 Doctoral Preliminary Exam 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

ENT 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Entrepreneurship Initiative (EI)

EI - Entrepreneurship Initiative Courses

EI 201 Exploring Interdisciplinary Entrepreneurial Thinking 3.
Course covers the perspectives of entrepreneurial thinking from an interdisciplinary perspective including: expectations and understanding of successful entrepreneurs as well as entrepreneurial opportunities in a variety of disciplines and entities including sciences, technology, humanities and social sciences. Primary focus will be on developing the student’s entrepreneurial mindset.

EI 331 Interdisciplinary Entrepreneurial Thinking I: Skills and Planning Basics 3.
Prerequisite: EI 201.
Course covers the development and application of critical skills in entrepreneurship as well as the fundamentals of entrepreneurial planning including interdisciplinary opportunity identification and feasibility analysis. Some individual off campus travel might be required. Students are responsible for their own transportation to off campus activities. This course will be offered at least once per semester.

Entrepreneurship in Music and the Arts (EMA)
EMA - Entrepreneurship in Music and the Arts Courses

EMA 110 Introduction to Arts Entrepreneurship 3.
This course introduces students to the basic components of an entrepreneurial lifestyle in the arts for those interested in starting an arts business. Students explore fundamental issues arts entrepreneurs encounter and how they can be addressed before the startup process reaches the launch cycle. Students are required to provide their own transportation to and cover the admission costs of off-campus events.

EMA 293 Independent Study in Arts Entrepreneurship 1-3.
Independent study offering under the direction of a faculty member. Requirements for the independent study will be determined by the student and faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

EMA 295 Special Topics in Arts Entrepreneurship 1-3.
Timely topical courses or experimental course offerings in Arts Entrepreneurship.

EMA 365 Foundations in Arts Entrepreneurship 3.
This course will introduce and outline the role, purpose, and perception of "art" in various marketplaces and contexts for the emerging arts entrepreneur. Topics include: issues in marketing aesthetic products, consumer identification through art, models of consumer behavior, art and technology, macro-economic issues that affect the arts industries, arts policy and access.

EMA 370 Practical Arts Entrepreneurship 3.
This course will introduce and outline the cultural and economic environment of the arts in the United States. Topics include: the start-up process of for- and non-profit entities, economic and social impact of art and artists in communities, public and private arts support, non-profit culture and basic grantsmanship, arts policy, creative economy efforts, the role of geography, demand and infrastructure considerations in entrepreneurial decision-making, competition analysis and marketing.

EMA 375 Understanding the Arts Economies 3.
Prerequisite: EMA 370.
This course explores arts and arts-related economies of critical importance to the emerging arts entrepreneur. Topics include: creative, experimental and hybrid economies, Arts infrastructure in urban and rural areas, arts clusters, patronage, broader economic conditions effecting arts economies, the relationship of "art" to segmented technology economies.

EMA 430 Capstone Experience in Arts Entrepreneurship 3.
Prerequisite: EMA 375.
Students analyze arts and arts-related businesses through the use of case studies in addition to executing an entrepreneurial project concerning the arts in a Raleigh community. This class introduces students to the decision-making skills necessary to sustain arts ventures and focuses on constructing innovative solutions to common problems arts and arts-related entrepreneurs encounter. Information gained from the prerequisite courses will be put to authentic use in either a non- or for-profit setting. Transportation and some costs may be required for project work.

EMA 493 Advanced Independent Study in Arts Entrepreneurship 1-3.
Advanced Independent Study offering under the direction of a faculty member. Requirements for the independent study will be determined by the student and faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Environmental Assessment (EA)

EA - Environmental Assessment Courses

EA 502 Environmental Risk Assessment 3.
Prerequisite: Two semester sequence of college biology & college chemistry.
This course provides students with an appreciation and understanding of the principles of environmental risk assessment including: Hazard Identification, Toxicity Assessment, Exposure Assessment, and Risk Characterization. Emphasis is placed on contemporary problems in human health and the environment, and it will be based on the most current methodologies described in the "Risk Assessment Guidance for Superfund." Enrollment in the course requires graduate standing or consent of the instructor. Two semester sequence of college biology & college chemistry.

EA 503 Environmental Exposure Assessment 3.
Prerequisite: Two semester sequence of college biology & college chemistry.
Provides students with an appreciation and understanding of the principles of environmental exposure assessment including the sources, transport and fate of chemicals in the environment. Emphasis is on contemporary problems in human health and the environment, covering topics such as: transformation and degradation processes, classes of contaminants a well as predicting environmental fate and exposure. Enrollment in the course requires graduate standing or consent of the instructor. Two semester sequence of college biology & college chemistry.

EA 504 Environmental Monitoring and Analysis 3.
Prerequisite: One Year College Biology and One Year College Chemistry.
Monitoring and analysis of chemical and biological impacts to the environment. Theory of chemical, physical, biological, and ecological monitoring. Planning and conducting environmental sampling and monitoring programs. Management, analysis, and quality assurance and control. Enrollment in the course requires graduate standing or consent of the instructor.

EA 590 Special Topics in Environmental Assessment 1-6.
EA 665 Professional Project 1-6.
Prerequisite: EA 502, EA 503, and EA 504.
Environmental assessment project conducted under the mentorship of a member of the graduate faculty.

Environmental Science (ES)

ES - Environmental Science Courses

ES 100 Introduction to Environmental Sciences 3.
Interrelationships between human populations and the natural environment. Human population trends, agriculture, air and water pollution, biological diversity, forest and land use, energy and mineral resources, and toxic substances. Consideration of related economic factors, laws, politics, political behavior, and ethical questions.
ES 150 Water and the Environment 3.
This interdisciplinary course focuses on the essential role of water in supporting all life on earth, and the expected impacts of rapidly changing water resources. Aspects of water issues will include physical sciences and engineering, life sciences, and social sciences. Case studies outline the importance of water in the global context and in specific settings, including North Carolina. The course will help prepare students for living in a rapidly changing world.

ES 200 Climate Change and Sustainability 3.
This course explores the relationships between humans and the environment with interdisciplinary content. Focus is on past impacts of climate change on human activities and future prospects. Course content is based on lectures with students also responsible for developing and presenting seminars.

ES 295 Special Topics in Environmental Science 1-4.
Provides instruction on rapidly emerging curriculum. Also provides courses on an experimental basis before incorporation into the curriculum. See specific course offering for course details.

ES 300 Energy and Environment 3.
Prerequisite: CH 101 or PY 212 or PY 208.
This course explores relationships between humans, energy, and the environment with interdisciplinary context. Themes include environmental impacts of energy production, distribution and use with discussion of new technologies. Half of the course content is from subject lectures and half from self-selected student projects. Student projects emphasize analytical approaches to solving environmental problems, and enhance skills in writing, seminars, and team work.

ES 400 Analysis of Environmental Issues 3.
Prerequisite: ES 100, ES 200, ES 300 and Senior standing.
A capstone course for students in environmental sciences or related majors. The course teaches use of analytical approaches for solving environmental problems, and for communicating results. The course emphasizes development of student projects that lead to environmental decision-making, such as devising a resource management plan, developing a predictive model, prioritizing risk, identifying tipping points, designing new software or technologies, or predicting outcomes of environmental policies. Individual student projects fit within a team framework to simulate a work environment. Students enhance writing and seminar skills. Student may incur extra expenses with projects for this course.

ES 495 Special Topics in Environmental Science 1-6.
Prerequisite: Junior standing.
This course provides instruction on rapidly emerging environmental themes not currently covered in the undergraduate curriculum. Also provides courses on an experimental basis. See specific course offering for course detail.

ES 496 Environmental Science Internship 1-3.
Students can earn 1-3 credits for completing internships in the public or private sectors. Emphasis is placed on gaining work experience needed to explore and plan careers in the environmental field. Students must prepare an internship proposal. Students must provide own transportation for internship. Students are required to purchase internship liability insurance. Contact university insurance & risk management for details on acquiring the insurance and the current charge. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

ES 497 Professional Development in Environmental Science 1-3.
The course provides 1-3 credits for students who develop skills necessary to organize, promote, and participate in an event such as a workshop, conference or a seminar. Examples of acceptable events include organizing a panel of speakers on a specific topic. A speaker series, a career fair, or a workshop. The formats and topics of events are determined by the organizing student(s). Each student prepares an event proposal before the student can register for ED 497. Students must provide own transportation for professional development in environmental sciences. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ES 498 Research in Environmental Science 1-3.
Students can earn 1 credit in ES 498 for every 50 hours of research during a semester up to a total of 3 credits FOR 150 of research in a semester. A student cannot complete more than 3 credits of ES 498 research in a single semester, or more than 6 credits in their program of study. Research can be traditional laboratory and/or fieldwork, or other creative activity. The student must produce a final report, seminar, or product that can be evaluated. Typically, the work for 1-3 credit of ES 498 research will be completed in one semester. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

ES 499 Thesis in Environmental Science 3.
ES 499 thesis provides academic credit for students who participate in original, inquiry-based learning and discovery in environmental sciences. Students present the thesis to a community of peers and experts for evaluation. ES 499 thesis requires a thesis proposal signed by the student, ES faculty advisor, a thesis host, and a supporting faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Environmental Technology (ET)

ET - Environmental Technology Courses

ET 105 Introduction to Environmental Regulations 1.
ET 105 is a 1 hour lecture/discussion class, required of all environmental technology majors. The course reviews all the major federal and state regulations and laws addressing, water air and soil pollution; solid, toxic and hazardous waste, occupational safety/health and environmental management systems. For ET majors only.

ET 120 Introduction to Renewable Energy Technologies and Assessments 3.
Overview of the various renewable energy assessment technologies. Students will learn what assessments and measurements can be taken to determine if renewable energy technologies will be effective in a particular location. Topics include biomass and biofuels, geothermal systems, solar thermal systems, photovoltaics, wind energy, and hydroelectric.

ET 201 Environmental Technology Laboratory I 1.
Use of field and laboratory instrumentation for monitoring water quantity and quality. Management, analysis, interpretation, and oral and written reporting of complex environmental data sets. Hands-on, real-world experience in water quality monitoring and maintenance. Required field trips may extend beyond class time.
ET 202 Environmental Technology Laboratory II 1.  
Use of field and laboratory instrumentation for monitoring plants, soils, and natural systems. Management, analysis, interpretation, and oral and written reporting of complex environmental datasets. Hands-on, real-world experience in project and soil quality monitoring and maintenance. Required field trips may extend beyond class time.

ET 203 Pollution Prevention 1.  
Prerequisite: ES 100.  
This course studies the prevention of the pollution of air, water, and terrestrial ecosystems. State of art technological solutions are discussed. The social, economic, legal and ethical dimensions of pollution prevention are integrated into the scientific and technological challenges facing developed and developing economies.

ET 220 Solar Photovoltaics Assessment 3.  
Prerequisite: ET 120.  
This course introduces specific elements in photovoltaic (PV) systems technologies including efficiency, modules, inverters, charge controllers, batteries, and system installation. Topics include National Electric Code (NEC), electrical specifications, photovoltaic system components, array design and power integration requirements that combine to form a unified structure. Upon completion, students should be able to demonstrate an understanding of various photovoltaic designs and proper installation of NEC compliant solar electric power systems.

ET 240 Wind and Hydroelectric Energy Assessment 3.  
This course introduces concepts, designs, tools, techniques, and material requirements for systems that convert wind and water into usable energy. Topics include the analysis, measurement, and estimation of potential energy of wind and water systems. Upon completion, students should be able to demonstrate an understanding of the technologies associated with converting wind and water into a viable energy source.

ET 252 Introduction to Spatial Technologies 3.  
Introduction to types of spatial information technologies and their uses in environmental assessments. Topics include: map reading, geographic positioning systems, geographic information systems, and remote sensing. This course will provide a basic overview of these technologies through lectures, and will afford an exposure to their uses through a series of structured laboratory exercises.

Prerequisite: ET 120.  
Overview of the historical and current role of bioenergy and biomass potential, technologies and systems, resource supplies, current market developments, and barriers to use in the USA. Students will learn biomass classifications and develop skills to assess landscapes for woody and non-woody biomass stocks, yields and energy values. Skills for techniques to measure woody biomass for managed forest plantations and natural forest stands and select herbaceous bioenergy crops will be developed. Emphasize North Carolina sites and spatial data to develop conceptual framework and assessment skills. Targeted for science and non-science students.

ET 262 Renewable Energy Adoption: Barriers and Incentives 3.  
The understanding of the economic, social, and legal barriers and incentives to renewable energy adoption is an important facet to helping renewable energies reach their potential. This course explores mechanisms that can be used and that have been used successfully in the US and in other parts of the world to remove those barriers and to promote greater use of renewable resources, particularly in rural areas and on agricultural and forested lands.

ET 293 Independent Study in Environmental Technology & Management 1-6.  
Independent Study for Environmental Technology & Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ET 294 Independent Study in Environmental Technology & Management 1-6.  
Independent Study for Environmental Technology & Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ET 295 Special Topics in Environmental Technology & Management 1-6.  
Special Topics in Environmental Technology & Management at the 200 Level for offering courses on an experimental basis.

ET 301 Environmental Technology Laboratory III 1.  
Assessment of and response to environmental hazards caused by hazardous materials releases. Regulatory requirements associated with hazardous materials releases. Utilization of chemical protective clothing and respiratory protection. Students passing the class receive Occupational Safety and Health Administration (OSHA) 40-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) certification. Required field trips may extend beyond lab time.

ET 302 Environmental Technology Laboratory IV 1.  
Use of field and laboratory instrumentation for monitoring outdoor and indoor air quality. Management, analysis, interpretation, and oral and written reporting of complex environmental datasets. Hands-on, real-world experience in air quality monitoring and maintenance. Required field trips may extend beyond class time.

ET 303 Laboratory Safety Systems and Management 1.  
Theory and practice of regulation, management, and auditing of laboratory safety. Laboratory field trips may extend beyond class time.

ET 310 Environmental Monitoring and Analysis 3.  
Prerequisites:CH 101 or 100; BIO 181; ET students only.  
Monitoring and analysis of chemical, biological, and radiation impacts to the environment. Theory of chemical, physical, biological, and ecological monitoring. Planning and conducting environmental sampling and monitoring programs. Management, analysis, and quality assurance and control. Risk assessment in environmental technology. Laboratory practice and safety.

ET 320 Fundamentals of Air Pollution 3.  
Prerequisite: (MA 121, MA 131, or MA 141) and (PY 131 or PY 201 or PY 205 or PY 211).  
Air pollution sources, and the influence of natural and anthropogenic processes on the atmosphere. Roles of local, state and federal governments in air pollution control and importance of the Clean Air Act and its amendments.

ET 330 Environmental Technology Practicum 3.  
Preparation for practicum, including resume writing, interviewing skills, cover letters, and practicum search techniques and resources. Professional practice as an environmental technologist. Written and oral communications of the practicum experience.
ET 401 Environmental Technology Laboratory V 1.
Scientific and legal definitions of brownfield and EPA Superfund sites. Physical, chemical, and biological methods for remediating contaminated sites. Impacts of hazardous waste management on public and private sector organizations. Field trips to public and private brownfield and Superfund remediation sites to examine real-world applications of principles. Required field trips may extend beyond class time.

ET 410 Toxic Substances and Society 3.
Prerequisite: Junior standing.
Interdisciplinary evaluation of past, present and future effects of toxic substances in the environment. Addresses various dimensions of toxic substances; special emphasis on ways to minimize adverse effects in contemporary and future societies.

ET 455 Adaptive Management and Governance 3.
Junior standing or above.
Some environmental and natural resource problems are more difficult to resolve than others. The purpose of this course is to understand the factors that condition intractable or "wicked" environmental and natural resources conflicts. These factors include narrow conceptions of science, rigid bureaucratic structures and narrow policy targets. We also explore some of the alternatives for addressing intractable environmental and natural resource problems- including adaptive management and governance.

ET 460 Practice of Environmental Technology 3.
Prerequisite: ET 310 or SSC 442; and ET Senior Only.
Preparation and presentation of comprehensive environmental assessments and analyses. Critical roles of quality control and assurance. The ISO 14000 environmental management standard of the American National Standards Institute (ANSI). Preparation for certification as an environmental auditor by ANSI and registration as an Environmental Professional by the National Register of Environmental Professionals. Optional training and exams for Environmental Auditors Registration Association and American National Standards Institute/ Register Accreditation Board Written Examination available.

ET 470 Environmental Forensics 3.
Prerequisite: ET 310 or SSC 442.
Use of site assessment methodologies and state of the art technologies from analytical chemistry, molecular biology, biogeochemistry, and GIS to solve environmental cases of "Who done it?" with regards to soil/sediment, water, and air contamination. Two field trips which may extend beyond class time are required.

ET 484 Practice of Renewable Energy Assessments 1.
P: ET 220 and (ET 240 or ET 255 or ET 262); R: Renewable energy assessment minors only.
Renewable Energy Assessment principles, practices, and technologies. Lectures and field practicum concerning renewable energy potential on a variety of types of land across North Carolina. This course is for enrollment by students who are minoring in renewable energy assessments only.

ET 490 Senior Seminar in Environmental Technology 1.
Prerequisite: ET Senior Only.
Weekly departmental and university seminars and group discussions to enrich and broaden student perspectives on the practice and development of environmental technology. Oral and written reporting of seminars topics.

ET 493 Independent Study in Environmental Technology & Management 1-6.
Independent Study for Environmental Technology & Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ET 494 Independent Study in Environmental Technology & Management 1-6.
Independent Study for Environmental Technology & Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ET 495 Special Topics in Environmental Technology & Management 1-6.
Special Topics in Environmental Technology & Management at the 400 level for offering courses on an experimental basis.

Fashion and Textile Design (FTD)

FTD - Fashion and Textile Design Courses

FTD 104 Fashion and Textile Design First Year Studio I 6.
Co-requisite: D 100.
This course provides Fashion and Textile Design freshman with a comprehensive introduction to foundational design concepts and methods representative of the creative thought and processes of fashion and textile design disciplines. The coursework encourages entering freshmen to think creatively through design and art, and the world around them, as they secure a skillful level of craftsmanship in the design and making of textile products. Design language, design elements and principles, and design communication and theory will be studied through readings and applications and will be experienced in person through field trips. Additional costs may be incurred for field trips.

FTD 105 Fashion and Textile Design First Year Studio II 6.
Prerequisites: D 100 and FTD 104; Co-requisites: D 101 and FTD 200.
This course is the continuation of the comprehensive introduction to foundational design concepts and methods representative of creative thought and activity across design and artistic disciplines, started in FTD FY Studio I. The course work encourages first year students to think critically in depth about concept, context, material, and design process, for textile and fashion product development. There will be readings and applications in advanced design theory, including processes, methods, philosophies and related concepts. The class will involve field trips to experience these advanced design principles in person. Additional costs may be incurred.

FTD 200 Design Skills Workshop 3.
Prerequisite: TT 105 and Corequisite: D 105.
First course in developing student's use of design tools for the production of prototype products from textile materials, beginning with the selection of appropriate fabric and other raw materials and extending through critiquing the product. Concepts of ethical and sustainable design are built into the analysis and design of the product. A variety of techniques for designing sewn textile products are explored, as well as methods and safe practices for using equipment in the studio. FTD Majors Only.
Prerequisite: D101, D103, FTD 105, and a grade of C or better in FTD 200.  
Application of industry textile design and visualization software to conception, design, development and presentation of creative textiles and textile products. Essential creative skills for textile design, such as motif and repeat development, will be introduced. Textile design solutions will be sampled using industrial technologies such as a digital printing, electronic knitting and computer-driven weaving. Color will be explored as a primary designer's tool including use in textile design, sensitivity and skills in communicating color, color perception and color theories, and color forecasting, creative projects will build skills in CAD for textiles and color. Additional costs may be incurred for course materials/equipment. FTD majors only.

FTD 215 Fashion Design 1  3.  
Prerequisite: Grade of C or better in FTD 200 and Corequisite: FTD 201.  
Studio course which introduces students to the basic rules and principles of flat pattern-making for apparel products. Advanced applications will be demonstrated through workshops utilizing concept-driven problems and follow-up critiques. Concurrent practices with computer-aided design will be presented where applicable. FTD majors only.

FTD 216 Fashion Workroom Practices  3.  
Prerequisite: (Grade of C or better in FTD 200) or (Grade of C or better in FTM 219).  
Studio course introducing the basic concepts and practices for the creation of final garments and extending through quality analysis of the final product. Incorporates workroom techniques for production of a variety of sewn product applications using various fabrications. FTD majors only. Additional costs may be incurred for course materials/equipment.

FTD 218 Fashion Illustration  3.  
Prerequisite: ADN 281.  
Concepts and practices for the fashion figure and fashion illustration, including the analysis of fashion figure structure details, proportion, and fashion figures clothed with different apparel and materials. The training of effective drawing of different fashion styles, wearing status and occasions, and the study of applying multiple illustration approaches to enhance fashion design and presentation. Additional costs may be incurred for course materials/equipment. FTD and FTM majors only.

FTD 321 Fashion Design by Draping  3.  
Prerequisite: (C or better in FTD 215 and FTD 216) or (C or better in FTM 219 and FTD 315).  
Exploration of three-dimensional methods of apparel design using textile substrates. Design and execution of draped garment structures will be explored in a studio setting. Additional costs may be incurred for course materials/equipment. FTD and FTM majors only.

FTD 373 Yarn Design Studio  3.  
Prerequisite: TT 221 and a grade of C or better in FTD 201.  
Design of yarns and sample production, including the creation of novelty yarns, fancy yarns, and innovative effects in spun and plied fibers. Exploration of color, luster, twist, and slub variations in yarns to address both functional and aesthetic challenges. Studio experiences in creating innovative yarns appropriate for use in different fabric formation technologies. Additional costs may be incurred for course materials/equipment. FTD majors only.

FTD 374 Surface Design and Texture  3.  
Prerequisite: TT 105 and a grade of C or better in FTD 200 and FTD 201.  
Exploration of innovative surface design and texture techniques for commercial and art applications. Embroidery, applique, stitching, fabric manipulation and aesthetic finishing processes for creative and functional design will be taught in state of the art facilities including digital printing, screen printing, cad embroidery, and industrial cad software for print design. Additional costs may be incurred for course materials/equipment. FTD majors only.

FTD 375 Woven Textile Design Studio I  3.  
Prerequisite: Grade of C or better in both TT252 and FTD 373.  
Design and sample production of woven fabrics. Exploration of basic structures, color and textural effects. Development of design abilities through creative projects executed using hand production methods, including an introduction to computer-integrated woven textile design systems and industrial processes. Study of actual fabrics and digital images, presentations will be made. Studio experience will be augmented, when possible, through outside speakers and field trips to mills. Additional costs may be incurred for course materials/equipment. FTD majors only.

FTD 376 Knitted Textile Design Studio I  3.  
Prerequisite: Grade of C or better in both TT252 and FTD 373.  
Design and sample production of hand and machine knitted textiles. Exploration of basic structures, terms and definitions, including knitting notation and terminology. Development of creative knitted products utilizing design abilities and appropriate yarns through hand and machine production methods. Introduction to computer integrated knit design system and industrial knitting products and processes. Additional costs may be incurred for course material/equipment. FTD majors only.

FTD 419 Fashion Design 2  3.  
Prerequisite: Grade of C or better in FTD 215, FTD 216, FTM 317, and FTD 321.  
Studio course which poses fashion problems to be solved with an emphasis on elements of design. Explores use of experimentation and development of “studies” as an aid in developing design ideas. Uses combination of flat pattern and CAD. Introduction to grading, marker making, and computer-controlled cutting. Additional costs may be incurred for course materials/equipment. FTD majors only.

FTD 420 Fashion Collection Preparation  3.  
Prerequisite: Grade of C or better in FTM 318 or (FTD 321 and corequisite of FTD 419).  
Studio course exploring sources of inspiration requiring students to research, develop and translate ideas into a line plan for a collection of garments. Stresses the extension and elaboration of ideas within a specific market. Integrates knowledge across the curriculum. Student may work with a firm, contest, or current theme to develop a fashion design statement. Additional costs may be incurred for course materials/equipment. FTD and FTM majors: Fashion Design and Fashion Development concentrations only.
FTD 479 Senior Textile Design Studio 6.
Prerequisite: FTD 374, FTD 475, FTD 476.
Design and execution of creative projects integrating learning within the curriculum, solution of textile design problems through synthesis of knowledge and skills gained through previous courses, preparation of work for portfolio, exhibition and participation in industry focused design competitions. Professional textile design practices and methods including advanced portfolio development concepts and presentation, development of textile collections suited to specified end use with emphasis on ideation, refinement, and design development, presentation and visual communication. The student will be expected to work with design, science, engineering, technology, and management disciplines. Additional costs may be incurred for course materials/equipment. Senior Standing, BS Fashion and Textile Design, Textile Design majors ONLY.

FTM 217 The Textile Industry 3.
Prerequisite: TT 105.
Study of the structure and organization of the integrated textile complex and its strategic functions. Critical stages involved in the manufacture of textile and apparel products. Fundamental aspects of cost management and finance as related to the integrated Textile Complex. One Saturday attendance during the semester is required.

FTM 219 Fashion Product Analysis 3.
Concepts and practices for the production and evaluation of fashion goods, beginning with selection of fabric and other raw materials and extending through quality analysis of the final product. Provide techniques for production of a variety of garment applications, as well as methods for evaluation.

FTM 220 Principles of Retailing and Supply Chain Management in Textiles 3.
Prerequisite: FTM 217.
Introduction to theories and principles in fashion and textiles retailing and supply chain management including: the framework of textile retailing, textile retail strategies, textile supply chains and investigation of the strategic planning process. Emphasis placed on conducting an environmental scan, identifying and targeting the consumer, analyzing the trade area, site selection and textile product merchandise planning.

Introduction to the operation of design software for woven, knitted and printed textiles. Adobe Photoshop, Pointcarre’ and Monarch programs will be taught. Peripheral equipment essential to the design process will be included. Field trips to areatextile design centers. Credit not allowed for students enrolled in TT curriculum with the exception of the dual degree in the Bachelor of Art and Design and BS in Textile Technology.

FTM 282 Introduction to Textile Brand Management and Marketing 3.
An introduction to the essential elements of brand management and marketing with specific reference to the marketing of textile and apparel goods with the integrated textile complex (from fiber to retail). The course covers both the principles and practice of marketing, in general, and provides an introduction of major concepts of brand management and marketing with a focus on branding activities used in by major textile and apparel firms within the integrated textile supply chain.

Prerequisite: Junior standing.
Academic dimensions of the entrepreneurship body of knowledge. Integration of new product development (NPD) process and entrepreneurship in textiles. Critical thinking skills for the textile entrepreneurial mindset. Teams exercise entrepreneurial skills to develop innovative textile products. Write a business plan to take the textile product to market. Multidisciplinary and experiential learning environment is cultivated through in-class activities and online collaboration.

FTM 315 Fashion Product Design 3.
Prerequisite: FTM 217 and FTM 219.
Concepts and practices for the design and development of fashion apparel items, beginning with selection of fabric and other raw materials and extending through flat pattern development, pattern engineering, and generation of final garments. Provide techniques for development of styled patterns, which address issues of body measurements, body shape, comfort and fit.

FTM 317 Computer-Aided-Design for Apparel 3.
Prerequisite: FTM 215 or Corequisite: FTM 315.
Introduction to the operation of industry design software for apparel & other sewn products. Euphoria and/or Artworks visual design programs, Gerber Accumark or Lectra pattern design programs, and other programs used by the industry to create, market and/or visualize products will be taught. Peripheral equipment essential to the design process will be included.
FTM 318 Fashion Development Processes 3.
Prerequisite: FTM 317.
The principles of apparel manufacturing including computerization of the design; marker making and production areas; spreading and cutting technology; apparel assembly systems; production systems evaluations; fusing and pressing; production capacity; and quality evaluations.

FTM 320 Retail Merchandising in Fashion and Textiles 3.
Prerequisite: FTM 220.
An in-depth study of textile product merchandising and its functions, focusing on a comprehensive approach to textile product merchandising that links manufacturing and retailing to the consumer through the merchandising process. Textile merchandising as a process is studied in newly restructured consumer-centric businesses and textile product strategy needed for employees to function successfully in today's global, integrated world of merchandising.

FTM 352 Dress, Style, Change 3.
Interdisciplinary course focusing on historical and cultural principles of style as related to dress and fashion. Examination of fashion and stylistic trends in cycles of dress.

FTM 380 Management and Control of Textile and Apparel Systems 3.
Prerequisite: FTM 217; Corequisite: TT 221.
Management approaches, practices and basic economic considerations in the development, production and distribution of industrial and consumer textile and apparel products.

Prerequisite: FTM 282 and (EC 201 or ARE 201).
This course builds on the introduction of the basic concepts introduced in TAM 282 by providing an in-depth examination of the major theories and concepts associated with brand management and brand marketing. Included is the identification and analysis of major strategic tools used for brand management and marketing activities by firms across the integrated textile complex. Students will be assigned practical application projects that require utilization of academic knowledge with industry application.

FTM 384 Visual Merchandising Principles and Management 3.
Prerequisite: Junior standing or higher, FTM 217, Corequisite: FTM 382.
Study and application of techniques in the effective display of merchandise, from fiber to finished product. The focus of the course placed on the integration of textile and apparel product characteristics, target market characteristics and the latest merchandising technology and concepts.

FTM 385 Fashion and the Consumer 3.
Prerequisite: FTM 217, FTM 282.
This course focuses on consumer decision process for textile products, including the study of environmental, individual, psychological and marketing influences on behavior of consumers in the textile consumption process. Further examination will include influences on the process, including fashion theories, the mass media, demographics and psychographics, and societal trends. Current development and research in the textile consumer decision process are reviewed.

FTM 387 Textile Brand Communications & Promotions 3.
Prerequisite: FTM 382.
Examines the utilization of textile brand marketing communication and promotion tools to build, maintain or expand a brand's value in the textile complex marketplace. Includes examination of principles and theories for Integrated Brand Marketing (IBMC) and how these strategies and tactics are used within the textile complex advance brand positioning. Knowledge of IBMC will be demonstrated via case studies, examination and textile industry-related application projects. FTM Majors Only.

FTM 400 Major Fashion Designers 3.
Study of fashion designers from the early 1800s to the present. Emphasis will be placed on historical and cultural events that may have influenced the work of fashion designers during the time and trends that have emerged. Of specific interest will be major historical and current fashion designers that have had an international influence on US fashion merchandise. An additional focus of the course will be on the career path of major fashion designers. A study of haute couture and pret-a-porter will be conducted to provide insight into special management issues.

FTM 415 Fashion Product Development 3.
Prerequisite: FTM 318.
Fashion product development for specific target markets. Line production using various methods of generating patterns for mass-produced apparel with emphasis on "flat pattern" design techniques. Relationship of body configuration to pattern shape, specifications to garment size and fit, standards for judging fit, distinctions between ease and style fullness, and design analysis procedures are included.

FTM 416 The Fashion Industry 3.
Prerequisite: Senior standing.
Planning and sourcing of fashion apparel products to meet the needs of the consumer. Emphasis is placed on the role of the merchandiser and merchandising function together with the measures of performance required by the fashion businesses. The interactions of the merchandiser with the functions of marketing, design, development and sourcing during pre-production are studied with respect to successful sourcing. Sourcing is studied from the requirements of compliance, product quality, cost, and manufacturing capability.

FTM 420 Retail Buying in Fashion and Textiles 3.
Prerequisite: FTM 320.
Overview and analysis of the components of buying and selling products at the retail level. Management of profit factors to improve performance in textile merchandising driven organizations. Analysis of the practices, procedures and systems that track textile merchandising decisions and aid in meeting profit goals. The course consists of an integrated framework that applies merchandising theory and mathematical processes to textile retail problems.

FTM 431 Quality Management and Control In Textile Manufacturing 3.
Prerequisite: TT 221, TT 252, TT 331, and ST 361 or BUS 350.
Principles of quality and process management and control in textile/ apparel manufacturing with emphases in quality management systems, quality costs, statistical control chart procedures, process capability, acceptance sampling, and optimal process and product design and improvement methods.

FTM 460 Textile Market Research 3.
Prerequisites: FTM 382 and (ST 311, ST 361, or ST 370).
Data from textile and apparel industry firms are utilized to explore the role of marketing research in managerial decision-making within the textile and apparel industry, and allow students to develop basic skills in the market research process (problem identification to final reporting). Topics included are problem formulation, research design, data collection (instruments and sampling), and data analysis techniques (qualitative and quantitative).
Prerequisite: TT/FTM 380 and ACC 210 and ([MA 131 and MA 132) or MA 141] and (ST 311 or ST 361 or BUS 350 or ST 370).
Quantitative techniques for decision making and management in the textile complex. Applications include vendor selection, plant location, retail inventory management, forcasting demand, project management, and logistics planning. Techniques covered include simulation, PERT/CPM, mathematical modeling.

Capstone course covering cost issues in yarn manufacturing, fabric formation, finishing, apparel production and retail operations. Traditional and activity-based costing systems will be addressed. Relevance of costing to managerial decisions as well as cost reduction strategies will be emphasized.

FTM 482 Advanced Textile Brand Management and Marketing 3.
Prerequisite: FTM 382.
An applied textile marketing course that integrates textile product development, brand management, and global marketing. This course provides an overview of the global textile and apparel industries, their distribution channels and markets---with positioning the US textile, apparel, and retail industries in the global competitive environment. The course includes diverse textile end uses, including apparel, nonwovens, home textiles, transportation textiles and medical textiles. Development and implementation strategies of launching textile products in the global marketplace are analyzed.

FTM 483 Global Trade & Sourcing 3.
Prerequisite: FTM 282 and EC 201 or ARE 201 or EC 205.
This course provides students with an understanding and appreciation of the global textile and apparel market. Included is the explanation and guidance in understanding the uniqueness of textile and apparel regulations in global trade. Students will learn global sourcing strategies and the identification and analysis of major strategic decisions used in global sourcing, as impacted by global trade dynamics. Students will be assigned practical application projects that require utilization of academic knowledge with industry application.

FTM 484 Strategic Planning and Decision Making in the Textile and Fashion Industries 3.
Prerequisite: BUS 320 or FTM/TT 380, and TT 221 or equivalent.
The course provides a framework for understanding and analyzing strategic planning and decision making in the textile and apparel supply chain, from fiber through retail. It integrates theory and practice through lectures, case studies, and exercises to provide students an understanding of the competitive dynamics in the textile industry, including structural and behavioral components and the role of entrepreneurship.

FTM 485 Textile Computer Integrated Enterprise 3.
Prerequisite: TT/FTM 380.
Survey of information technology in textile and apparel industries. Topics discussed include: computer aided design (CAD); computer aided manufacturing (CAM); computer aided engineering (CAE); material handling systems; automation and robotics; logistics and warehousing systems; retail product tracking, and Internet resources.

FTM 486 Supply Chain Management in the Textile Industry 3.
Prerequisite: TT/FTM 380.
Study of the operations necessary to produce and distribute a product, starting with the procurement of the raw material used in making the goods and ending with the delivery of the finished product. Topics covered include approaches to solving problems in manufacturing, sourcing, transportation logistics, and retail operations within the Integrated Textile Complex. Credit cannot be given for both TAM486 and MT386.

FTM 487 Textile and Apparel Labor Management 3.
Prerequisite: Senior standing.
Labor management problems. Emphasis directed toward role of production supervision in textile and apparel plants. Study of NLRB decisions and court opinions involving textile and apparel corporations.

FTM 490 Development Projects in Textile and Apparel Management 1-3.
Prerequisite: Junior standing and 2.75 GPA.
Directed research in Textile and Apparel Management through experimental, theoretical and literature studies in textile and apparel-related problems. Courses may be taken twice provided projects are different subject matter.

FTM 491 Special Topics in Textile and Apparel Management 1-4.
Prerequisite: Senior standing.
Special topics related to textile and apparel management.

FTM 494 International Industrial Internship in Textile Management 3.
Prerequisite: At least FL 202 for internships in non-English speaking countries, Minimum GPA 2.5, Junior standing.
Professional level work experience in textile management abroad, relating academic training, international textile management and technology to industrial practice under professional guidance. Grading based on written report and oral presentation. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

FTM 497 Senior Fashion Collection Studio 6.
Prerequisite: FTM 318.
Advanced fashion product design. Design and production of a "collection" using various methods of generating patterns for garments, such as flat pattern, draping, and CAD techniques. Relationships of body configuration and fabrication to garment design. Emphasis on ideation, creativity, communication, theme development, fit, quality, and exhibition of a fashion collection. Work culminates in a Fashion show or Static exhibition format.

FTM 499 Textile Senior Project 4.
Prerequisite: Senior standing.
This is a project based course to be taken in the last semester of the Senior year. In this capstone course the students work in cross-functional teams to research and solve applied problems in textile related fields. The results of the projects will be presented formally at the end of the semester. Course should be taken in the last semester of the Senior year. It cannot be substituted by other project courses.

Feed Mill (FM)
FM - Feed Mill Courses

FM 425 Feed Manufacturing Technology 3.
Prerequisite: ANS(NTR,PO) 415 or ANS 230 or ANS 225.
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

FM 460 Feed Mill Operations and Leadership 2.
Prerequisite: PO(ANS) 425.
Principles and current practices of modern feed mill operations. Topics include managing employees, team building, safety, budgets, regulations, and key performance indicators.

FM 480 Feed Quality Assurance & Formulation 3.
Prerequisite: PO(ANS) 425.
Introduction to the principles of ingredient and feed quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of approved suppliers, ingredient specifications, feed manufacturing procedures, and formulation based on dynamic ingredient matrices.

FM 490 Feed Science Seminar 1.
Exploration of topics related with current and future potential to influence the feed industry. Guest lectures from feed industry leaders and university representatives will include: vertically integrated and commercial feed production, current research topics, government regulations, trade organizations, and quality assurance.

FM 494 Feed Mill Learning Experience 1.
Prerequisite: PO(ANS) 425.
Hands-on laboratory teaching students how to safely operate feed mill equipment and manufacture feed using a computer system.

FM 525 Advanced Feed Science and Technology 3.
Prerequisite: PO/ANS/NTR 415 or ANS 230 or related feed industry experience.
Feed mill management, equipment, maintenance, operation, safety, and regulations pertaining to feed manufacturing. Feed ingredient purchasing, inventory, storage, quality evaluation, and computerized feed formulation. Advanced NTR525 topics include more detailed aspects of feed science and technology, feed mill design and process flow, operations management, feed quality assurance, regulations, and computer applications. The Distance Education section will have independent study assignments in place of lab experience. Credit will not be given for both PO/ANS 425 and NTR 525.

FM 580 Feed and Ingredient Quality Assurance 3.
Prerequisite: NTR(FM) 525.
The course will teach students the principles of feed and ingredient quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of an approved supplier list, ingredient specifications, feed manufacturing quality assurance procedures, and risk based feed safety programs.

FM 594 Advanced Feed Mill Practicum 1.
Prerequisite: NTR(FM) 525.
This course will teach students the principles of operating a modern feed mill. Students will receive ingredients, grind grain, manufacture feed, and perform quality checks on finished feed products. Students will complete safety, quality assurance, and feed processing training units as part of their training.

FM 790 Advanced Feed Formulation 3.
Prerequisite: NTR(FM) 525.
Principles of feed and ingredient quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of an approved supplier list, ingredient specifications, feed manufacturing quality assurance procedures, and risk based feed safety programs.

Film Studies (FLM)

FLM - Film Studies Courses

FLM 378 Women & Film 3.
This course will introduce students to the rich international history of women’s participation in the motion picture industry. Course includes readings, screenings, discussions, and a final examination.

Financial Mathematics (FIM)

FIM - Financial Mathematics Courses

FIM 528 Options and Derivatives Pricing 3.
Prerequisites: MA 341 and MA 405 and MA 421.
The course covers (i) structure and operation of derivative markets, (ii) valuation of derivatives, (iii) hedging of derivatives, and (iv) applications of derivatives in areas of risk management and financial engineering. Models and pricing techniques include Black-Scholes model, binomial trees, Monte-Carlo simulation. Specific topics include simple no-arbitrage pricing relations for futures/forward contracts; put-call parity relationship; delta, gamma, and vega hedging; implied volatility and statistical properties; dynamic hedging strategies; interest-rate risk, pricing of fixed-income product; credit risk, pricing of defaultable securities.

Prerequisites: (MA 421 or ST 421), MA 341, and MA 405.
Monte Carlo (MC) methods for accurate option pricing, hedging and risk management. Modeling using stochastic asset models (e.g. geometric Brownian motion) and parameter estimation. Stochastic models, including use of random number generators, random paths and discretization methods (e.g. Euler-Maruyama method), and variance reduction. Implementation using Matlab. Incorporation of the latest developments regarding MC methods and their uses in Finance.

FIM 549 Financial Risk Analysis 3.
Prerequisites: MA 405 and (MA 421 or ST 421) and (MA/ST 412 or MA/ST 413).
This course focuses on mathematical methods to analyze and manage risks associated with financial derivatives. Topics covered include aggregate loss distributions, extreme value theory, default probabilities, Value-at-Risk and expected shortfall, coherent risk measures, correlation and copula, applications of principle component analysis and Monte Carlo simulations in financial risk management, how to use stochastic differential equations to price financial risk derivatives, and how to backtest and stress-test models.

FIM 590 Special Topics in FIM 1-6.
Special Topics in FIM.

FIM 601 Seminar in Financial Mathematics 1-3.
Seminar in Financial Mathematics.

FIM 610 Special Topics in Financial Mathematics 1-6.
Special Topics in Financial Mathematics.

FIM 620 Special Problems in FIM 1-6.
Special Problems in FIM.
FW 314 Coastal Ecology and Management 1.
Prerequisite: BIO 181.
Hands-on study of the fishery and wildlife resources associated with North Carolina coastal plain habitats. These habitats will include estuarine, ocean, longleaf pine savanna, pocosin, and Carolina bays. Common techniques and concepts used in terrestrial, marine, and estuarine ecology and management will be taught. Field identification of habitats, animals, and plants. Use of multiple sampling gear including bottom trawl, beam trawl, beach seine, gill nets, and coverboards. Use of water quality measurement equipment. This course meets all day for 1 week off-campus at CMAST in Morehead City, NC. Additional charge for room and board and boat rental. Students must provide their own transportation to CMAST.

FW 333 Conservation Biology in Practice 3.
Prerequisite: FW 221 or PB 360 or BIO 360 or FOR 260.
An introductory course designed to focus on the scientific fundamentals of conservation biology, including population dynamics, extinction and its causes, metapopulations, modeling, population viability analysis, the design and management of protected areas, rare species management, and captive breeding and release programs. Students will participate in active learning exercises, projects, and debates. Projects will require students to make their own arrangements for transportation to field locations within Wake County.

FW 353 Wildlife Management 3.
R: Sophomore Standing.
Historical development of Wildlife Management from anecdotal, observational practices to modern, scientific approaches used around the world. Principles of population analysis, management, protection and conservation of animals, particularly those of conservation, aesthetic, sport or food values in urban, rural and wilderness areas. Ethics of hunting and trapping. Contradictory objectives challenging modern wildlife managers.

FW 373 Vertebrate Natural History 3.
Prerequisite: BIO 360 or PB 360.
This course provides an introduction to the natural history of vertebrates, including fish, amphibians, reptiles, birds, and mammals. The emphasis is on systematics, identification, and natural history of each vertebrate group.

FW 403 Urban Wildlife Management 3.
Prerequisite: Junior standing.
Issues facing wildlife in urbanizing landscapes and the general courses of action to minimize the negative effects of urbanization on native wildlife. Large-scale planning and zoning for roads, developments and open space; meso-scale planning and landscaping of new neighborhoods and other developments; and small-scale landscaping for backyard habitats. Coexistence between wildlife and humans in urban environments and management of wildlife damage to human property.
FW 404 Forest Wildlife Management 3.
Prerequisite: Junior standing.
Relationships between forest and wildlife management and the effects of silvicultural systems on wildlife. Species-habitat requirements, forest wildlife management techniques, and forest-wildlife policies and economics.

FW 405 Tropical Wildlife Ecology in Nicaragua 3.
This 9-week course provides an overview of tropical wildlife ecology and management, sustainable land use, and the Nicaraguan culture. The course addresses the challenges of natural resource conservation in a developing country and the sustainable approaches that may be used to conserve natural resources there. Various methods to sample wildlife will be employed in Nicaragua, but emphasis will be on the use of mist nets in long-term bird monitoring program in a shade-grown coffee plantation. Expenses associated with this course are the responsibility of the student. Requires instructor approval.

FW 411 Human Dimensions of Wildlife and Fisheries 3.
Juniors and Seniors Only.
Study of human interactions with wildlife and fisheries, including principles important for understanding and addressing wildlife management and conservation challenges. Discussions of wildlife at the urban fringe, human attitudes towards hunting and fishing, and the public trust approach to wildlife management are included.

FW 415 Professional Development in Fisheries, Wildlife, and Conservation Biology 1.
This course provides guidance for students in the fall semester of their senior year in preparation for graduate school or a career in the field of Fisheries, Wildlife, and Conservation Biology. Junior or Senior standing.

FW 444 Mammalogy 3.
Prerequisite: PB 360 or BIO 360 or FOR 260.
The biology of mammals: evolution, functional morphology, reproduction, behavior, ecology, population biology, classification and identification. One weekend field trip planned. One independent field research project is required. Graduate students will prepare a full written report of their research projects, which will not be required of the undergraduates.

Prerequisite: One 200-level or higher course in BIO, ES, ET, FOR, FW, NR, PB, PRT, or ZO.
This course examines the fundamental concepts, problems, and methods regarding human dimensions of conservation biology in The Bahamas. Combining lecture, lab, and fieldwork, students directly experience the process of science, with students conducting semester-long, group research projects tackling important unanswered questions involving conservation biology in The Bahamas. Gaining first-hand experience at the interface of basic and applied sciences, students will spend eight weeks on campus and two weeks in the largely undeveloped Andros Island in The Bahamas, home to the third largest coral reef in the world and over 1.5 million acres of national parks.

Prerequisite: FW 353 and ST 311.
Principles and applications of population dynamics and biology to the management of terrestrial vertebrates. Predicting population levels, composition and growth rates with and without management constraints. Strategies for wildlife conservation, utilization, and enhancement. Laboratories stress the collection and analysis of data, and often meet in outdoor environments.

Prerequisite: Junior standing and above.
An international perspective on wildlife management and conservation through investigation and comparison of historical events, policies, international conservation organizations and transfrontier conservation areas. Fundamental principles necessary in managing the African savanna ecosystem, protected areas and game ranches. Identifying global biomes, zoogeography and the impacts of ecotourism. Cannot receive credit for both FW 460/560.

Prerequisite: One 200-level or higher course in ES, ET, FOR, FW, NR, PB, PRT, or ZO.
This course provides an international perspective on desert ecology, the African savanna ecosystem, African wildlife ecology and management. In addition, the management of a large national park of international importance, conservation of predators and their conflict with humans, and international tourism are discussed. Various sampling techniques are practiced during field work. A combination of lectures, field lectures, field work, field excursions, data analyses and home work form an integral part of the course.

FW 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

Independent Study for Fisheries, Wildlife, and Conservation Biology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Independent Study for Fisheries, Wildlife, and Conservation Biology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FW 495 Special Topics in Fisheries and Wildlife Science 1-3.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

FW 511 Human Dimensions of Wildlife and Fisheries 3.
Study of human interactions with wildlife and fisheries, including principles important for understanding and addressing wildlife management and conservation challenges. Discussions of wildlife at the urban fringe, human attitudes towards hunting and fishing, and the public trust approach to wildlife management are included.

FW 515 Fish Physiology 3.
Prerequisite: GN 411, ZO 420, 421, 441.
The biology of fishes: physiology, anatomy, endocrinology, behavior and genetics. Designed especially for graduate students in fisheries. Several trips to research laboratories taken.
FW 544 Mammalogy 3.
The biology of mammals: evolution, functional morphology, reproduction, behavior, ecology, population biology, classification and identification. One weekend field trip planned. One independent field research project is required. Graduate students will prepare a full written report of their research projects, which will not be required of the undergraduates.

FW 553 Principles Of Wildlife Science 3.
Prerequisite: BO 360 or ZO 260.
The principles of wildlife management and their application studied in the laboratory and in the field.

Prerequisite: One course in wildlife management or zoology or biology or natural resources or forestry or botany, Graduate standing.
An international perspective on wildlife management and conservation through investigation and comparison of historical events, policies, international conservation organizations and transfrontier conservation areas. Fundamental principles necessary in managing the African savanna ecosystem, protected areas and game ranches. Identifying global biomes, zoogeography and the impacts of ecotourism. Cannot receive credit for both FW 460 and FW 560.

This course provides an international perspective on desert ecology, the African savanna ecosystem, African wildlife ecology and management. In addition, the management of a large national park of international importance, conservation of predators and their conflict with humans, and international tourism are discussed. Various sampling techniques are practiced during field work. A combination of lectures, field lectures, field work, field excursions, data analyses and home work form an integral part of the course.

FW 567 Aquaculture 3.
Prerequisite: BO 360 or ZO 260 or Graduate standing or Senior standing.
Biological and general principles of aquaculture. Emphasis on the present status of aquaculture, species involved, techniques employed, and problems encountered. Discussion of recent advances in research and development and identification of areas of future research and development.

FW 587 Aquaculture Laboratory 1.
Prerequisite: BO 360 or ZO 260 or Graduate standing or Senior standing, Corequisite: ZO 586.
Methods and techniques of cultivating aquatic organisms. Field trips and reports on local hatcheries and facilities required. (Three to four overnight field trips taken on week days to coastal areas, state hatcheries, and private hatcheries; students responsible for shared room costs and their meals. Four field trips also taken on laboratory day within driving range of Raleigh.)

FW 595 Special Topics in Fisheries and Wildlife Sciences 1-6.
Special topics in various aspects fisheries and wildlife sciences are developed under the direction of a graduate faculty member. Also used to test and develop new courses.

FW 602 Seminar In Wildlife Management 1.
Current topics and issues in wildlife biology and management. Students select and research topics, give seminars and lead group discussions.

FW 610 Special Topics in Fisheries and Wildlife Sciences 1-6.
Special topics in various aspects of fisheries and wildlife science are developed under the direction of a graduate faculty member. Also used to develop new courses.

FW 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

FW 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

FW 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

FW 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

FW 720 Epidemiology of Wildlife Diseases 3.
Concepts related to infectious disease outbreaks in free-ranging species of wildlife. Numerous examples of wildlife diseases will be used to illustrate factors affecting host-agent-environment interactions in fish, amphibians, birds, and both aquatic and terrestrial mammals. Enrollment in the Fisheries and Wildlife graduate program or Masters of Veterinary Public Health program; clinical residents or veterinary students at the College of Veterinary Medicine.

FW 726 Quantitative Fisheries Management 3.
Current methods for assessment and management of exploited fish populations, including sampling methods, data analysis and modeling. A required research paper or project.

FW 730 Ethics in Fisheries and Wildlife Sciences 2.
Students will explore historical and current thinking concerning the search for truth about natural systems, and the complex ethics scientists and practitioners who operate in the public sector must consider. Standards of professional and ethical behavior specific to Fisheries and Wildlife Sciences will be addressed. Faculty will introduce topics and guide discussions; students will give seminars and lead some discussions. For doctoral students in Fisheries and Wildlife Sciences.

FW 801 Issues in Fisheries and Wildlife Sciences Doctoral Seminar 2.
Current topics and issues in Fisheries and Wildlife Sciences Research. Students select and research topics, give seminars on Ph.D. proposals, and lead group discussions. For doctoral students in Fisheries and Wildlife Sciences.
FW 802 Seminar in Fisheries and Wildlife 1.
Current topics and issues in fisheries and wildlife biology and management. Students select and research topics, give seminars, and lead group discussions. For doctoral students in Fisheries and Wildlife Sciences.

FW 810 Special Topics in Fisheries and Wildlife 1-6.
Individual students or groups of students, under direction of a faculty member, will explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to dissertation. Also used to develop and test new 800-level courses. For doctoral students in Fisheries and Wildlife Sciences.

FW 885 Doctoral Supervised Teaching 1-3.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment. For doctoral students in Fisheries and Wildlife Sciences.

FW 890 Doctoral Preliminary Exam 1-9.
For students who are preparing for and taking written and/or oral preliminary exams.

Instruction in research and research under the mentorship of a member of the Graduate Faculty. For doctoral students in Fisheries and Wildlife Sciences.

Dissertation Research. For doctoral students in Fisheries and Wildlife Sciences.

Summer Dissertation Research. For doctoral students in Fisheries and Wildlife Sciences.

For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

**Food Science (FS)**

**FS - Food Science Courses**

**FS 201 Introduction to Food Science 3.**
Science and practice of providing a wholesome, nutritious, economical and readily available supply of basic and processed foodstuffs.
Chemical nature of foods, nutritional requirements, health-related dietary considerations, microorganisms, foodborne illnesses, preservation and processing, food additives, food labeling, food safety and the consumer.

**FS 231 Principles of Food and Bioprocess Engineering 4.**
*Prerequisite: PY 211.*
Engineering concepts and their applications to the food and bioprocessing industries. Mass and energy balances and principles related to fluid flow, heat transfer, refrigeration and freezing, psychrometrics, and selected unit operations found in these industries.

**FS 250 Basics of Food Safety & Quality 3.**
This course examines the programs that maintain food safety and quality in food processing environments. It is based on international standards for food safety prerequisite programs in food manufacturing. Students will learn how to evaluate and manage pre-requisite programs for food safety. Examples include Good Manufacturing Practices (GMPs), Sanitation Standard Operating Procedures (SSOPs), Sanitation Control Procedures, and Preventive Controls.

**FS 290 Careers in Food and Bioprocessing Sciences 1.**
Careers and opportunities related to food and bioprocessing industries and regulatory agencies. Development of professional enhancement skills. Resume preparation, interviewing techniques, leadership development, oral and written communication, and team building. Benefits of undergraduate research, internships, and graduate education.

**FS 295 Special Topics in Food Science 1-4.**
Offerings of new or experimental courses in Food Science at the early undergraduate level.

**FS 301 Introduction to Human Nutrition 3.**
*Prerequisite: Sophomore standing.*
Functions, dietary sources, digestion and absorption, deficiencies and excesses of essential nutrients in humans; dietary guidelines; food labels; the study of diet-disease relationships; the role of diet in heart disease, diabetes, hypertension, osteoporosis; energy balance and weight control; dietary supplement regulation; diet and athletic performance.

**FS 322 Muscle Foods and Eggs 3.**
*Prerequisite: ZO 160, BIO 181 or BIO 183.*
Processing and preserving fresh poultry, red meats, seafood, and eggs. Ante- and post-mortem events as they affect quality, yield, and compositional characteristics of muscle foods. Principles and procedures involved in the production of processed meat items.

**FS 324 Milk and Dairy Products 3.**
*Prerequisite: BIO 181 or 183, CH 101.*
Introduction to the manufacture of dairy products. Dairy processing procedures from the farm, through the dairy plant, and to the consumer are studied. The course consists of 15 learning modules, three exams, and a project.

**FS 330 Science of Food Preparation 3.**
*Prerequisite: FS 201 and CH 101.*
Basic elements of culinary practices are taught in conjunction with the scientific basis for how flavor, texture, and appearance of foods are created or maintained during food preparation.

**FS 350 Introduction to HACCP 3.**
Introductory course on the Hazard Analysis and Critical Control Points System (HACCP) which is designed to decrease hazards in foods. An International HACCP Alliance approved curriculum which covers prerequisite programs. A step by step approach for developing and implementing a HACCP plan for USDA regulated food processing plants. Offered only as a world wide web course through the Office of Instructional Telecommunications.
FS 351 Sanitation Standard Operating Procedures in Food Safety Control.
This course is one of a series of six courses that are part of North Carolina State University’s Food Safety Certification program. "Sanitation Standard Operating Procedures (SSOP’s) in Food Safety Control" addresses current federal regulatory requirements for seafood, meat, and poultry processing operations. The course also addresses the international dimensions of sanitary standards in import/export of food. The course is designed to provide the student with the background necessary to develop, implement and maintain a sanitation plan based on sanitation standard operating procedures (SSOP’s).

FS 352 Introduction to Microbiological Food Safety Hazards.
For non-science students. The course is designed to provide an introduction to the more prominent microbial foodborne safety hazards and their control. Lessons are provided on specific pathogens, their pathogenesis and transmission and the scientific basis for specific control options. In addition, the course provides up-to-date information on current "hot-topics" in food microbiology, including food safety regulations and emerging food safety issues. Course is offered to non-science majors. Students may not receive credit for both FS 352 and FS 405.

FS 353 Good Manufacturing Practices.
Food Safety sanitation in the United States is primarily regulated by FDA under their “Good Manufacturing Practices (GMP).” This course will introduce the student to the GMP and consider how and why they were developed. Students will become familiar with the issues of compliance and consider the regulations in light of international laws and current practices. The student should have some familiarity with food processing and safety.

FS 354 Food Sanitation.
Prerequisite: FS/ANS/PO 350 or equivalent HACCP industry experience. Discussion of hygienic practices, requirements for sanitation programs, and modern sanitation practices in food processing facilities. At the end of this course, students will have the knowledge to develop and maintain a sanitation program.

FS 355 Advanced Nutrition and Metabolism.
Prerequisite: (NTR 301 or NTR 415) and (CH 221 or CH 220 or CH 225). Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference Intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone muscle, blood, growth and development and communication. Credit will not be awarded for both NTR (FS) 401 and NTR (FS) 501.

FS 402 Chemistry of Food and Bioprocessed Materials.
Prerequisite: CH 220 or 221 or 225. The course focuses on the properties of biological molecules (e.g., proteins, enzymes, lipids, carbohydrates and pigments) found in foods and pharmaceuticals. Basic elements of molecules, such as structure and reactive groups, are presented in regard to how they affect the properties of foods and pharmaceuticals. Reactions such as Maillard browning and lipid oxidation are discussed regarding mechanisms, products and controlling processes. Laboratory experiments emphasize basic concepts discussed in lecture and provide a practical working knowledge of select analytical equipment.

FS 403 Analytical Techniques in Food & Bioprocessing Science.
Prerequisite: FS 402. Principles, methods and techniques for quantitative physical and chemical analyses of food, nutraceutical, and pharmaceutical products. Results of analyses evaluated in terms of quality standards and governing regulations.

FS 405 Food Microbiology.
Prerequisite: MB 351. Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage: foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

FS 406 Food Microbiology Lab.
Prerequisite: MB 351 and Corequisite: FS 405 or FS 505. Laboratory experience to complement FS/MB 405. Skills in detecting and quantitating microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunoassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

FS 407 Risk Analysis and Hazard Analysis in Food Safety.
Prerequisite: FS/ANS/PS 350 or equivalent HACCP industry experience. In-depth focus on the application of the first HACCP principle, Hazard Analysis, on the identification of food safety hazards, as well as the emerging importance of risk assessment. Distance Education Only.

FS 416 Quality Control in Food and Bioprocessing.
Prerequisite: ST 311. Organization and principles of quality control in the food and bioprocessing industries. Regulations and process control to maintain safety and quality. Evaluation of physical, microbiological, chemical, sensory, and stability testing for food and bioprocessed materials. Risk assessment, hazard analysis and critical control point (HACCP), process control, water quality, waste water analysis and reduction. Cleaning and sanitation and compliance inspection.

FS 421 Food Preservation.
Prerequisite: FS 231 and FS 405. Food preservation methods. Emphasis on thermal, freezing, drying and fermentation processes and corresponding physical, chemical and organoleptic changes to products. Application of preservation schemes to the development of an overall processing operation.

FS 426 Upstream Biomanufacturing Laboratory.
Prerequisite: (MB 351 and FS 231) CHE/BEC 463. This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.
FS 453 Food Laws and Regulations 3.
Prerequisite: Junior standing.
Federal and state laws and regulations, and case law history affecting food production, processing, packaging, marketing, and distribution of food and food products. History of food law, enactment of laws and regulations, legal research, and regulatory agencies. Credit will not be given for both FS 453 and FS 553.

FS 462 Postharvest Physiology 3.
Prerequisite: PB 421.
Preharvest and postharvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve postharvest quality and extend storage life of fruits, vegetables and ornamentals.

FS 475 Problems and Design in Food and Bioprocessing Science 3.
Prerequisite: FS 231, FS 402, FS 405 or BAE(BBS) 425.
Team approach to problem solving and product/process design and development. Ingredient functionality; formulation, safety, processing, packaging, sensory evaluation, regulatory issues, hazard analysis, critical control points (HACCP), nutritional labeling and other pertinent scientific, technical, marketing and financial aspects. Oral and written presentations are required.

FS 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by the student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

FS 493 Special Problems in Food Science 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by the student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

FS 495 Special Topics in Food Science 1-3.
Offered as needed to present materials not normally available in regular course offerings or for offering new courses on a trial basis.

FS 501 Advanced Nutrition and Metabolism 3.
Prerequisite: (NTR 301 or NTR 415 or NTR 500) and (CH 221 or CH 220 or CH 225).
Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone, muscle, blood, growth and development, and communication. Credit will not be awarded for both NTR(FS) 401 and NTR(FS) 501.

FS 502 Chemistry of Food and Bioprocessed Materials 4.
Prerequisite: CH 220 or 221 or 225.
The course focuses on the properties of biological molecules (e.g., proteins, enzymes lipids, carbohydrates and pigments) found in foods and pharmaceuticals. Basic elements of molecules, such as structure and reactive groups, are presented in regard to how they affect the properties of foods and pharmaceuticals. Reactions such as Maillard browning and lipid oxidation are discussed regarding mechanisms, products and controlling processes. Laboratory experiments emphasize basic concepts discussed in lecture and provide a practical working knowledge of select analytical equipment.

FS 505 Food Microbiology 3.
Prerequisite: MB 351.
Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage; foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

FS 506 Food Microbiology Lab 1.
Prerequisite: MB 351 and Corequisite: FS 405 or FS 505.
Laboratory experience to complement FS/MB 405. Skills in detecting and quantifying microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunoassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

FS 520 Pre-Harvest Food Safety 3.
Dairy, beef, swine, poultry, and seafood modules: production, government regulation of products, use of antimicrobials in production, and the emergence of resistant human pathogens. Field fruit and vegetable crops section: hazards in food including pesticide residues and philosophy and practice of organic farming and public's perception of food and biotechnology.

FS 521 Food Preservation 3.
Corequisite: MB 351.
Food preservation methods. Emphasis on thermal, freezing, drying and fermentation processes and corresponding physical, chemical and organoleptic changes to products. Application of preservation schemes to the development of an overall processing operation.

FS 522 Food Packaging 3.
This course deals with the history of packaging, types of packages, and packaging equipment, factors involved in choice of package, aseptic packaging, shelf-life studies, modified atmospheric packaging, active packaging, packaging for e-commerce, automatic identification and data capture, closures, seal integrity, tamper evidence, graphic design & printing, distribution, labeling, environmental issues, regulatory agencies and stipulations, new frontiers in packaging, and packaging resources. Restricted to students enrolled in (or degree received in) the Food Bioprocessing and Nutrition Sciences Program or a closely related program such as the Biological & Agricultural Engineering Program.
FS 526 Upstream Biomanufacturing Laboratory 2.
Prerequisite: (MB 351 and FS 231) CHE/BEC 463.
This course is an introduction to current food manufacturing practice (CGMP) as applied to the growth of microbial cells in bioreactors. Hands-on experience is obtained in the operation and control of 30 liter bioreactors to study agitation, oxygen transfer, cleaning, sterilization, media preparation and the growth of recombinant E. coli for protein production. Credit will not be awarded in both BBS 426 and BBS/FS 526. This is an eight week course.

FS 530 Post-Harvest Food Safety 3.
Prerequisite: MB 351/352.
Background on the current issues and developments associated with post-harvest food safety, including biological, chemical, and physical food safety hazards. Additionally, regulations governing food safety and consumer perceptions.

FS 540 Food Safety and Public Health 3.
Prerequisite: MB 351/352.
Issues and developments related to the relationship between food safety and public health, including emerging foodborne pathogens; virulence and pathogenicity; foodborne toxins; epidemiological techniques used in the investigation of foodborne disease; rapid detection methods; and quantitative microbial risk assessment in food safety.

FS 550 Food Industry Study Tour 2.
The Food Industry Study Tour is designed to give students a behind the scenes look into the food processing industry. This week-long trip will allow students to travel throughout North Carolina and the Southeast region, touring various meat, dairy, seafood, produce, cereal, snack food, beverage, and candy production facilities. The class trip will run 5-6 days during the week of Spring Break holiday. Enrollment is limited and subject to the permission of the instructor.

FS 553 Food Laws and Regulations 3.
Federal and state laws and regulations and case law history affecting food production, processing, packaging, marketing and distribution of food and food products. History of food law, enactment of laws and regulations, legal research, and regulatory agencies. Credit for both FS 453 and FS 553 is not allowed.

FS 554 Lactation, Milk, and Nutrition 3.
Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421.
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 452 and 554.

FS 555 Exercise Nutrition 3.
Prerequisite: NTR 400/500.
Metabolism of macro- and micronutrients as affected by exercise and physical activity. Effects of dietary patterns, specific foods, dietary supplements and ergogenic aids on sports performance. Reading and discussion of current literature and individual or group projects.

FS 557 Nutraceuticals and Functional Foods 3.
This course evaluates the weight of evidence from peer-reviewed scientific literature relating food bioactives, whole foods, and diets to disease prevention, athletic performance, and cognitive development/ enhancement. Data are viewed in the context of processing effects, global food and supplement regulations, as well as commercial marketing claims. Key concepts include dose-response, signal transduction, and the use of advanced technologies such as genomics, proteomics and metabolomics. Students will work in teams to develop and write a critical review manuscript suitable for publication.

FS 562 Postharvest Physiology 3.
Prerequisite: PB 321.
Pre- and post-harvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve quality and extend storage life of crops.

FS 567 Sensory Analysis of Foods 3.
Prerequisite: Statistics 511.
Techniques of sensory analysis and data interpretation, a crucial aspect of food science research and marketing both at the academic and industrial levels. Fundamental and applied aspects of sensory analysis of foods, including human senses, descriptive analysis, scaling, consumer testing and sensory-instrumental relationships.

FS 580 Professional Development and Ethics in Food Safety 1.
Prerequisite: FSA 520 or FSA 530 or FS 540.
Professional development and thics related to food safety. Food safety communications to lay-audiences and the media; the ethical frontier between science/policy and science/profit. Planned student and faculty presentations as well as guest lectures on current topical issues.

FS 591 Special Problems In Food Science 1-6.
Prerequisite: Graduate standing or Senior standing.
Analysis of scientific, engineering and economic problems of current interest in foods. Problems designed to provide training and experience in research.

FS 592 Special Research Projects in Food Science 1-6.
FS 620 Special Problems In Food Science 1-6.
Prerequisite: Graduate standing or Senior standing.
Analysis of scientific, engineering and economic problems of current interest in foods. Problems designed to provide training and experience in research.

FS 623 Special Research Projects In Food Science 1-6.
Directed research in a specialized phase of food science designed to provide experience in research methodology and philosophy.

FS 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

FS 690 Master’s Examination 1-9.
Prerequisite: Master’s student.
For students in non thesis master’s programs who have completed all other requirements of the degree except preparing for and taking the final master’s exam.

FS 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.
Prerequisite: Master's student.
Thesis research.

FS 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

FS 706 Vitamin Metabolism 2.
Prerequisite: ANS(NTR,PO) 415 and BCH 453.
Structures, chemical and physical properties, functions, deficiency symptoms, distribution, absorption, transport, metabolism, storage, excretion and toxicity of vitamins in humans and domestic animals. Nutritional significance of essential fatty acids and metabolism of prostaglandins, prostacyclins and leukotrienes.

FS 725 Fermentation Microbiology 3.
Prerequisite: BCH 451, MB 351.
Fermentation bioprocessing and characteristics, function and ecology of responsible microorganisms. Fermentative activities, growth responses and culture interactions related to metabolism, physiology and genetics of lactic acid bacteria and selected yeasts and molds. Current developments in starter culture technology and genetics; application to food and industrial fermentations.

FS 741 Thermal Processing of Foods 3.
Prerequisite: FS 231.
Fluid flow, heat transfer, food preservation, kinetics of chemical, microbiological, and enzymatic reactions, decimal reduction time, pasteurization, sterilization, cook value, process lethality, canning of foods, thermal process evaluation, quality considerations, optimization, shelf-life studies, thermal processing equipment, hot-fill, extended shelf-life products, heat exchanger design, pumps, sanitation, aseptic processing, minimal processing, NFPA bulletins, alternative processing technologies, regulatory issues, HACCP.

FS 751 Food Ingredient Technology In Product Development 4.
Prerequisite: FS 402, FS 405, FS 421.
Chemistry and functional properties of major food ingredient materials. Legal and regulatory restrictions, as well as consumer biases, in existence with respect to selection of ingredients, package materials, processes and labeling statements. Necessary skills and techniques for efficiently and successfully conducting food product development projects in a competitive corporate setting.

FS 785 Food Rheology 3.
Prerequisite: FS 331 or MAE 314.
Principles and methods for measuring rheological properties. Theories of elastic, viscous, viscoelastic and viscoplastic behavior and relationships to food texture and commodity damage during harvest, handling and processing. Influence of time, composition and processing.

FS 791 Special Problems In Food Science 1-6.
Directed research in a specialized phase of food science designed to provide experience in research methodology and philosophy. Credits Arranged.

FS 792 Special Research Projects in Food Science 1-6.
Credits Arranged.

FS 820 Special Problems In Food Science 1-6.
Prerequisite: Graduate standing or Senior standing.
Analysis of scientific, engineering and economic problems of current interest in foods. Problems designed to provide training and experience in research.

FS 823 Special Research Problems In Food Science 1-6.
Directed research in a specialized phase of food science designed to provide experience in research methodology and philosophy.

FS 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

FS 890 Doctoral Preliminary Exam 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

FS 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

**Food Science (FSA)**
**Foreign Language - Chinese (FLC)**

**FLC - Foreign Language - Chinese Courses**

**FLC 101 Elementary Chinese I 3.**
*Corequisite: FLC 103.*

**FLC 102 Elementary Chinese II 3.**
*Corequisite: FLC 104.*
Continuation of basic skills. Emphasis on speaking and listening with some reading, writing and Chinese culture.

**FLC 103 Elementary Chinese I Conversation 1.**
*Corequisite: FLC 101.*
Supplements conversational practice and handwriting skills for FLC 101. Students will gain practice at using their speaking skills in a variety of basic social situations.

**FLC 104 Elementary Chinese II Conversation 1.**
*Prerequisite: FLC 101 and FLC 103; Corequisite: FLC 102.*
Supplements conversational practice and handwriting skills for FLC 102. Students are encouraged to use their speaking skills in a variety of typical social situations. Special attention is given to naturalness of speech.

**FLC 201 Intermediate Chinese I 3.**
*Corequisite: FLC 203.*
Continuation of basic skills. Greater emphasis on reading, writing and Chinese cultural traditions.

**FLC 202 Intermediate Chinese II 3.**
*Corequisite: FLC 204.*
Continuation of basic skills. Focus on reading, writing, Chinese cultural traditions and patterns of behavior.

**FLC 203 Intermediate Chinese I Conversation 1.**
*Prerequisite: FLC 102 and FLC 104; Corequisite: FLC 201.*
Supplements conversational practice and handwriting skills for FLC 201. Students are encouraged to use their speaking skills in a variety of situations. Special attention is given to naturalness of speech and intonation.

**FLC 204 Intermediate Chinese II Conversation 1.**
*Prerequisite: FLC 201 and FLC 203; Corequisite: FLC 202.*
Supplements conversational practice and handwriting skills for FLC 202. Students are encouraged to use their speaking skills in a variety of situations. Special attention is given to naturalness of speech and intonation.

**FLC 301 Intermediate Chinese III 3.**
*Prerequisite: FLC 202.*
Last of the foundation courses in Chinese. Continued practice in speaking and understanding Chinese with new emphasis on writing and on the reading of cultural and literary texts.

**FLC 302 Intermediate Chinese IV 3.**
*Prerequisite: FLC 301.*
Continued practice in speaking and understanding Chinese with greater emphasis on reading and writing. Continued study of cultural and literary texts.

**FLC 351 Modern Chinese Popular Culture 3.**
Introduction to basic aspects of cultural practices and production in Chinese society, including consumer culture, education, work life, family relationships, everyday religious practices, aesthetic traditions, national identity, and gender. Reading and analysis of representative works of modern Chinese visual and print culture including literature, film, advertising, digital media and consumer products with attention to cultural analysis as well as to historical and cultural background.

**FLC 401 Advanced Chinese: Readings in Literature and Social Sciences 3.**
*Prerequisite: FLC 302.*
Continued training in the foundations of Chinese language, with emphasis on nuances of written Chinese. This course introduces advanced Chinese language students to modern literature and social science texts. Students read and analyze some of the finest works of 20th c. Chinese intellectuals, authors and social critics. The class explores a wide range of prose forms, styles, and subject matter. Emphasis will be placed on developing advanced-level proficiency in reading & writing, and on literary analysis & discussion of cultural & historical contexts.

**Foreign Language - English (FLE)**
FLE - Foreign Language - English Courses

FLE 100 Introduction to Academic Writing 3.
For non-native speakers of English. Intensive introduction to critical writing and reading in academic contexts. Exploration of writing processes and academic literacy skills: interpreting assignments; comprehending, analyzing, and evaluating college-level texts; inventing, drafting, and revising; seeking, providing, and responding to constructive feedback; collaborating effectively under varied learning models. Extensive writing practice and individualized coaching. Attention to grammar and conventions of standard written English. Intended as preparation for FLE 101. Only for non-native speakers of English. Requires C- or better. Credit for FLE 100 is not allowed if student has prior credit for FLE 101.

FLE 101 Academic Writing and Research 3.
Prerequisite: Grade of C- or better in FLE 100 or placement via ESL testing guidelines.
For non-native speakers of English intensive instruction in academic writing and research. Basic principles of rhetoric and strategies for academic inquiry and argument. Instruction and practice in critical reading, including the generative and responsible use of print and electronic sources for academic research, adapted for non-native speakers. Exploration of literate practices across a range of academic domains, laying the foundation for further writing development in college. Continued attention to grammar and conventions of standard written English. Satisfies freshman English requirements. Successful completion of FLE 101 requires a C- or better. Credit for FLE 101 is not allowed if the student has already fulfilled the first-year writing requirement.

FLE 201 Oral Communication in English for International Students 3.
Oral communication in English; active and interactive speaking skills, listening comprehension and reading. Specific tasks in spoken English such as communicating information, making inquiries, requests and complaints. Individual and group work in the form of oral reports, role play, presentations, etc. Listening to lectures and note taking skills.

FLE 400 American English Pronunciation for International Students 3.

FLE 401 Advanced Oral Communication in English for International Students 3.
Oral communication in English; pronunciation skills, reading, aural comprehension and oral skills; communication strategies and cross-cultural communication; individual and group activities such as presenting information, teaching a class, fielding questions and leading a discussion.

FLE 402 Advanced Written Communication in English for International Students 3.
Written communication skills for graduate students; integrated writing tasks focusing on writing, reading, grammar and comprehension, specifically geared to the needs of research students and teaching assistants. Reading, critical analysis and synthesis of written material such as journal articles, research reports, etc.

FLF - Foreign Language - French Courses

FLF 101 Elementary French I 3.
First in a four-course sequence to develop language skills. Oral and written practice in classroom and language laboratory. Readings in French culture and civilization.

FLF 102 Elementary French II 3.
Prerequisite: FLF 101.
Continuation of FLF 101 with intensive practice in spoken French. Readings in French culture and civilization.

FLF 110 Accelerated Elementary French 3.
Prerequisite: Placement into this course determined by The Department of Foreign Languages and Literatures Placement Test: http://sasw.chass.ncsu.edu/fll/place.htm.
Content of FLF 101 and 102, at an accelerated pace, for students with previous study of French (1-2 years in high school) who placed into the course based on results of the NC State French Placement Test. Includes a refresher of 101 material before covering 102 material. Development of skills in listening, speaking, reading, writing and understanding Francophone cultures. Significant amount of work outside of class. Fulfills the FL 102 requirement.

FLF 201 Intermediate French I 3.
Prerequisite: FLF 102 or FLF 110.
Third of four consecutive courses to develop skills of speaking, listening, reading and writing. Readings and discussions of French culture, civilization and literature.

Prerequisite: FLF 201.
Last of four sequential language courses. Increased emphasis on reading and writing. Readings in the literature, culture, and civilization of France and the Francophone world.

FLF 212 French: Language, Culture, and Technology 3.
Prerequisite: FLF 102 or FLF 110.
A study of the language structures and vocabulary necessary for an intermediate level of communication in French together with cultural and technological issues of our global society, in the context of the French-speaking world and the European Union. Students are responsible for providing their own transportation for required field trip. Fulfills the FL 201 requirement.

FLF 301 Survey of French Literature from the Middle Ages through the Enlightenment 3.
Prerequisite: An advanced language skills course (FLF 308, 310, 315) or FLF 202 with permission of instructor.
Reading and discussion of representative works with attention to literary analysis as well as to historical and cultural background.

FLF 302 Survey of French Literature from Romanticism to the Contemporary Period 3.
Prerequisite: An advanced language skills course (FLF 308, 310, 315) or FLF 202 with Consent of Instructor.
Reading and discussion of representative works with attention to literary analysis as well as to historical and cultural background.

FLF 306 French Business Communication 3.
Prerequisite: FLF 202.
Study of major forms of written and oral business communication used in the French-speaking world. Extensive work with current, culturally authentic materials. Emphasis on development of practical communicative skills, with special attention to cross-cultural comparisons of French and American business practices and modes of communication.
FLF 307 Business French 3.
Prerequisite: FLF 202.
Business French vocabulary and concepts with emphasis on cultural differences and their importance in the new global village business world.

FLF 308 Advanced Conversation: Contemporary French Cultures 3.
Prerequisite: FLF 202.
Conversation and reading emphasizing idiomatic and practical usage with attention to contemporary civilization and cultures of the French speaking world. Emphasis on social structures, political features, events, world views and modes of communication.

FLF 309 French Phonetics and Pronunciation 3.
Prerequisite: FLF 202.
A study of the oral production of standard French with the aim of improving pronunciation, fluency and skill in communication. Extensive oral practice through conversation and phonetics.

FLF 310 Advanced Written Communication 3.
Prerequisite: FLF 202.
An in-depth study of French written communication at the advanced level, including the more advanced aspects of the French grammar with extensive writing practice serving a variety of practical communicative needs.

FLF 315 French Civilization and Culture 3.
Prerequisite: FLF 202.
French civilization and culture from its origins to the modern period. Reading and discussion of the social, cultural, economic and political structures of France, including its geography, history, music, art and national consciousness.

FLF 318 The Heritage of French Cinema 3.
Prerequisite: 3 hrs. in French at 300 level.
Survey of the major contributions of French cinema from its origins to the present. Attention to film as an artistic medium and to the cinematic representation of French history and culture. Reading, discussion, and viewing of films including *Un Chien Andalou*, *La Passion de Jeanne d'Arc*, *Le Retour de Martin Guerre*, *La Marseillaise*, *Les 400 Coups*, and *Divas*.

FLF 321 French Cultures and Contexts 3.
Prerequisite: FLF 202.
An approach to important periods in the history of French culture through the reading of texts by several important writers. Films, slides, painting, music, and the Internet will be included to put the readings in a cultural context.

FLF 401 French Graduate Reading 3.
Basic French grammar, with special attention to characteristics of formal expository style, and illustrative readings. Study of extracts from scholarly publications in students' areas of research. Prepares students to take the graduate foreign language certification exam.

FLF 411 Approaches to French Translation 3.
Prerequisite: at least two French (FLF) 300 level courses.
Intensive practice of translating to and from French a variety of texts selected from the areas of business, law, technology and science, as well as literature and the arts. Focus on Documentation, Research and Translation techniques and ethics.

FLF 414 Studies in French Prose 3.
Prerequisite: 3 hrs in French at 300 level with 3 hrs in literature.
Major developments in the French essay, letter, novel and other prose forms from the Renaissance to 1900. Readings from such authors as Montaigne, Sevigne, Lafayette, Rousseau, Sand, Balzac, Stendhal, Flaubert.

FLF 425 Literature, Cinema and Culture of the Francophone World 3.
Prerequisite: Graduate standing.
A study of a number of literary texts and films from across the spectrum of the Francophone world - West Africa, the Maghreb, and the Caribbean. Through these texts and films we will study the diversity of the French colonial empire as well as the different historical, political and cultural effects of colonialism and postcolonialism. Films, videos, internet sites will be used. Course taught in French.

FLF 492 Seminar in French Studies 3.
Prerequisite: Junior standing and 6 hrs in French literature.
A small-group study of a topic in literature resulting in either a substantial essay or series of essays by each student. Topics vary each semester.

FLF 502 Variety in Language: French 3.
Prerequisite: Graduate standing.

FLF 511 Approaches to French Translation 3.
Prerequisite: Graduate standing.
Intensive practice of translating to and from French a variety of texts selected from the areas of business, law, technology and science, as well as literature and the arts. Focus on Documentation, Research and Translation techniques and ethics. Course taught in French. Credit not allowed for both 411 & 511.

FLF 516 Art and Society in France 3.
An overview of the visual arts in France, defined broadly, and their relationship to French society and culture: painting, architecture, photography, cinema, book production, gardens, fashion, cuisine, television, popular culture, and mass media will be studied. Course taught in French.

FLF 521 French Cultures and Contexts 3.
Prerequisite: Graduate status required for FLF 521.
Study of important periods in the history of French culture through the reading of key literary texts. Films, slides, painting, music, and the Internet will be included to put the readings in a cultural context. Topics vary. Students cannot get credit for both 421/521.

FLF 525 Literature, Cinema and Culture of the Francophone World 3.
Prerequisite: Graduate standing.
A study of a number of literary texts and films from across the spectrum of the Francophone world - West Africa, the Maghreb, and the Caribbean. Through these texts and films we will study the diversity of the French colonial empire as well as the different historical, political and cultural effects of colonialism and postcolonialism. Films, videos, internet sites will be used. Course taught in French.

FLF 592 Seminar in French Studies 3.
Prerequisite: At least one 400-level French class; Graduate standing.
Seminar on literary, linguistic, or cultural topic in French studies. Research paper and oral presentation required. Conducted entirely in French. Rotating topics. Credit not allowed for both 492 and 592.

FLF 595 Special Topics in French 3-6.
Prerequisite: Graduate standing.
In depth exploration of specialized topics in French literature, culture or language. Also used to test and develop new courses. Course taught in French.
FLG 630 Independent Study in French 1-3.
Individualized study in French language or literature at the graduate level. Topic and mode of study to be determined in consultation with the faculty member supervising work.

FLG 675 Special Project in French 1-3.
Prerequisite: Student must be in final semester of his or her program.
Individual project in French language or literature at the graduate level. Topic and mode of study to be determined in consultation with student's project advisory committee within the parameters of specific options.

FLG 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

### Foreign Language - German (FLG)

**FLG - Foreign Language - German Courses**

**FLG 101 Elementary German I 3.**
The first in a four-course sequence to develop the language skills of listening, speaking, reading, and writing. Emphasis on the acquisition of everyday German and cultural awareness. Active class participation, practice in the language lab and computer lab, and written assignments.

**FLG 102 Elementary German II 3.**
Prerequisite: FLG 101.
Second in a four-course sequence to develop the language skills of listening, speaking, reading, and writing. Emphasis on the acquisition of everyday German and cultural awareness. Active class participation, practice in the language lab and computer lab, and written assignments.

**FLG 201 Intermediate German I 3.**
Prerequisite: FLG 102.
The third of four consecutive courses in German. Intensive conversational practice to develop proficiency in speaking and listening, advanced reading and writing skills by learning complex grammatical structures and through the use of authentic texts. Acquisition of cultural knowledge about the German-speaking countries.

**FLG 202 Intermediate German II 3.**
Prerequisite: FLG 201.
Last of four consecutive courses in German. Continued conversational practice to develop proficiency in speaking and listening. Development of advanced writing skills by refining grammatical structures and style through assignments, and of advanced reading skills through the use of cultural and literary texts from the German-speaking countries.

**FLG 212 German Language, Culture, Science, and Technology 3.**
Prerequisite: FLG 201.
Discussion of German, Austrian and Swiss scientific discoveries and technological inventions as well as their impact on global society, such as aspirin, x-rays, printing technology, diesel engine, computer, microchip, television, mp3 format, genetics, and environmental technologies. Also a fourth semester German course, with intensive practice to develop proficiency in intermediate speaking and listening, reading and writing, using materials from scientific and technological disciplines.

**FLG 301 Advanced German 3.**
Prerequisite: FLG 202 or FLG 212 or a score of 688 on the NC State placement test.
Review and consolidation of aspects of German grammar and development of writing skills. Listening and speaking practice through group activities and oral reports. Class discussions on topics from the cultures of Germany, Austria, and Switzerland, such as film, history, and the fine arts. FLG 301 and 302 can be taken in random order.

**FLG 302 German Oral and Written Expression 3.**
Prerequisite: FLG 202 or FLG 212 or a score of 688 on the NC State placement test.
Review and practice of spoken and written German using authentic texts and materials from contemporary Germany (short stories, films, and online media). Review of German grammar through conversation, writing, and vocabulary building exercises. Oral reports by students. FLG 301 and 302 can be taken in random order.

**FLG 307 Business German 3.**
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
Business German vocabulary and terminology. Readings and discussions on current business topics. Special consideration to intercultural communication relative to international business operations.

**FLG 311 Introduction to German Translation 3.**
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
Introduction to theory, methods, and techniques in translation applied to materials of various fields and professions. Emphasis on written translation.

**FLG 315 Germanic Civilization and Culture 3.**
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
Culture and civilization of the German-speaking countries. Analysis of the social, economic and political structures of Germany, Austria, and Switzerland. Lectures, reports, conversation. Taught in German.

**FLG 318 New German Cinema and Beyond 3.**
Prerequisite: FLG 202 or FLG 212.
Survey of the major contributions to German Cinema from the 1960's to the present day. Attention to film as an artistic medium and to the cinematic representation of German history and culture. Topics covered include Nazism, German Terrorism, former East Germany, debates on the position of minorities in Germany, and German Jewish relations. Taught in German.

**FLG 320 Introduction to German Literature 3.**
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
An introduction to reading and analyzing German, Austrian, and Swiss literary texts in their cultural and historical contexts. Discussion of various genres (short story, novel, drama, poetry) formal aspects, literary periods, and a variety of critical approaches. Lectures and much discussion. Oral and written assignments, exam.

**FLG 323 Twentieth Century German Literature 3.**
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
Twentieth century literature from German-speaking countries. Readings of Mann, Kafka, Rilke, Hesse, Durrenmatt, Frisch, Grass, and a variety of poets.
FLG 325 German Lyric Poetry 3.
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
A historical and interpretative study of the German lyric from the fifteenth into the twentieth century with special attention to the poet's choice of theme, the ways in which that theme is treated, and the relevance of the poem to the human experience.

FLG 390 German Studies Topics 3.
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
Presentation of material not available in regular course offerings, or offering of new courses on a trial basis. Course may be offered through videoconferencing with other UNC campuses as an offering of the German Studies Consortium. Content determined by faculty member in consultation with the department's German section coordinator. May be repeated.

FLG 398 Independent Study in German 1-6.
Prerequisite: FLG 202 or FLG 212 or placement at 300 level through the NC State placement exam.
Individualized study in German language, culture, or literature. Topic, mode of study, and credit hours to be determined in consultation with the faculty member supervising work. Departmental approval required. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FLG 401 German Graduate Reading 3.
Basic German grammar, with special attention to characteristics of formal expository style, and illustrative readings. Study of extracts from scholarly publications in students' areas of research. Prepares students to take the graduate foreign language certification exam.

FLG 420 Current Issues in German-Language Media 3.
Prerequisite: Two courses at the FLG 300 level.
Using the internet and a textbook, the course will be constructed from current topics circulated in the German, Austrian and Swiss media, e.g. newspaper websites, radio programs and TV news in streaming video format. Overview of the different news genres, the German-language media scape, and major political, economic, social and cultural issues in the German-speaking countries. Discussion, oral presentations, written assignments.

FLG 430 Cultural Artifacts in the German-Speaking Countries 3.
Prerequisite: One FLG 300-level course and one from this list: FLG 315, 316, 318, 320, 323, 325, 390.
Focuse on major cultural achievements in Germany, Austria and Switzerland, including literature, film, art, and music. Topics will vary. Examples are: "Kafka and Modernism", "German/Austrian/Swiss Literature and Film-Adaptations", "German-LanguageOpera", "German Art and Society in the 20th Century", or "The Faust Theme in Literature, Art, and Music". This course is repeatable so long as a different topic is covered each time.

FLG 440 Green Germany: Nature and Environment in German Speaking Cultures 3.
Prerequisite: 3 Hours of 300-Level German.
Survey of the long "Green" tradition in German-speaking cultures as reflected in the arts, in literature, and in scientific discoveries that have made Germany, Austria, and Switzerland leaders in development of alternative environmental technologies. Discussion in German of issues such as Romantic nature poetry, industrialization, Nazi attitudes towards nature, deforestation, the Green Party, air and water pollution, waste management, energy production, climate change, transportation systems, green architecture, sustainability, and the latest environmental technologies. Practice and assessment through class debates, group work, writing tasks, student presentations, and a portfolio.

FLG 492 Senior Seminar in German Studies 3.
Prerequisite: Two 300 level FLG courses on literature or culture or film. Capstone seminar in German literature or culture. Student presentations and either a substantial essay or a series of essays. Topics vary each semester.

FLG 499 Internship in Germany, Austria, or German-Speaking Switzerland 1-6.
Prerequisite: Two courses at the FLG 300 level.
Professional internship in a company or organization in Germany, Austria, or German-speaking Switzerland, with German as the main language of daily operations. Contract between the student, department, and company or organization about content, scope, and requirements. 1-6 credits for an approved internship. Essay describing and evaluating the internship experience in the context of student's professional development. Students are responsible for their own travel and living expenses. Departmental approval required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Foreign Language - Greek (GRK)

GRK - Foreign Language - Greek Courses

GRK 101 Elementary Greek I 3.
Introduction to Classical Greek. Greek alphabet, basic grammar and syntax. Readings based on Greek mythology, philosophy, and literature.

GRK 102 Elementary Greek II 3.
Prerequisite: GRK 101.
A second course in Classical Greek, continuing and expanding the work of GRK 101, and completing the study of grammar. Readings from major authors including Herodotus, Thucydides, and Xenophon.

GRK 201 Intermediate Greek I 3.
Prerequisite: GRK 102.
Introduction to Greek prose. Emphasis upon improvement of reading skill through vocabulary acquisition and study of complex grammar. Introduction to Attic dialect through reading Plato, and Koine Greek through reading the New Testament. Examination of the importance of these works to Western literature and culture.

GRK 202 Intermediate Greek II 3.
Prerequisite: GRK 201.
GRK 399 Directed Readings in Greek 3.
Prerequisite: GRK 202.
Advanced Greek language course introducing students to research methods in classical studies. Readings may include Plato, Homer, Sophocles, New Testament, or others. May be taken up to two times with different readings for credit.

Foreign Language - Hindi (FLN)

FLN - Foreign Language - Hindi Courses

FLN 101 Elementary Hindi-Urdu I 3.
Corequisite: FLN 103.
Introduction to standard Hindi-Urdu. Emphasis on speaking and listening, and on reading and writing in the Hindi writing system (Devanagari). Readings in South Asian culture and civilization.

FLN 102 Elementary Hindi-Urdu II 3.
Prerequisite: FLN 101, Corequisite: FLN 104.
Continuation of FLN 101. Emphasis on oral communication and reading and writing in the Hindi writing system (Devanagari). Further readings in South Asian culture and civilization.

FLN 103 Elementary Hindi-Urdu I Conversation 1.
Corequisite: FLN 101.
Required conversational practice for FLN 101. Special attention to individual pronunciation and intonation. Introduction of formal and informal speech. Use of audiovisual materials.

FLN 104 Elementary Hindi-Urdu II Conversation 1.
Prerequisite: FLN 101, Corequisite: FLN 102.
Required conversational practice for FLN 102. Extensive use of speaking skills in variety of situations. Attention to supplemental non-verbal communication. Use of audiovisual materials.

FLN 201 Intermediate Hindi-Urdu I 3.
Prerequisite: FLN 102, Corequisite: FLN 203.
Continuation of basic language skills. Further practice of Urdu/Hindi writing systems. Introduction to grammatical divergence of Hindi and Urdu. Readings in South Asian culture and civilization.

FLN 202 Intermediate Hindi-Urdu II 3.
Prerequisite: FLN 201, Corequisite: FLN 204.
Continuation of FLN 201. Further practice of both Hindi/Urdu writing systems. Further distinction of spoken and literary Urdu and Hindi. Further readings in South Asian culture and civilization.

FLN 203 Intermediate Hindi-Urdu I Conversation 1.
Prerequisite: FLN 202, Corequisite: FLN 201.
Required conversational practice for FLN 201. Advancement of speaking skills through role playing, interviews, debates. Further Hindi and Urdu non-verbal communication. Use of audiovisual materials, including responses to commercial television and movies.

FLN 204 Intermediate Hindi-Urdu II Conversation 1.
Prerequisite: FLN 201, Corequisite: FLN 202.
Required conversational practice for FLN 202. Refinement of speaking skills through role playing, interviews, debates. Further Hindi and Urdu non-verbal communication. Use of audiovisual materials, including responses to commercial television and movies.

FLN 301 Twentieth Century Hindi & Urdu Fiction 3.
Prerequisite: FLN 202.
Introduces advanced Hindi-Urdu students to the prose fiction of major Hindi and Urdu literary figures including Munshi Premchand, Saadat Hasan Manto and others. Texts will be provided in both Hindi and Urdu scripts and/or English translation as available.

FLN 302 Modern Hindi & Urdu Poetry 3.
Prerequisite: FLN 301.
Introduces advanced Hindi-Urdu students to representative works of 19th and 20th century Hindi and Urdu poets and poetic forms. Texts will be provided in both Hindi and Urdu scripts and/or English translation as available.

FLN 401 Hindi Literature and South Asian Cultural Contexts 3.
Selected topics in Hindi literature and/or South Asian literature in Hindi, such as drama in modern South Asia, the twentieth-century novel, literature and the nation, narratives of pain and resistance, gender and social reform. Readings and discussion in Hindi, with emphasis on the examination of formal literary characteristics and the interconnections of texts and relevant South Asian cultural contexts. Topics will be rotated so that students can take this course for credit up to three times.

Foreign Language - Italian (FLI)

FLI - Foreign Language - Italian Courses

FLI 101 Elementary Italian I 3.
Begins the development of a balanced foundation in all four language skills. Concentrates on listening and speaking, emphasizing idiomatic Italian. Short readings in Italian culture and civilization. Class and laboratory practice, written homework.

FLI 102 Elementary Italian II 3.
Prerequisite: FLI 101.
Continuation of FLI 101 with emphasis on acquisition of oral skills through class practice and use of audio aids. Readings in Italian culture, civilization and literature.

FLI 201 Intermediate Italian I 3.
Prerequisite: FLI 101.
Third of four consecutive courses to develop skills of speaking, listening, reading and writing. Readings and discussion of Italian culture, civilization and literature.

FLI 202 Intermediate Italian II 3.
Prerequisite: FLI 201.
Last of four sequential language courses. Increased emphasis on reading and writing. Readings in the literature, culture, and civilization of Italy.

FLI 208 Intermediate Italian Conversation 3.
Intensive practice in speaking and understanding Italian through role playing, discussion, interviews, and use of audio-visual materials.

FLI 308 Italian Reading and Conversation 3.
Prerequisite: FLI 202.
Advanced readings and intensive conversational practice in Italian for students beyond the intermediate level.

FLI 318 Italian Society Through Cinema 3.
Prerequisite: FLI 202.
Italian culture and society through cinema from the fascist era to the present. A study of selected films representative of major social-political, ideological, and artistic developments. Weekly film viewings.

Foreign Language - Japanese (FLJ)
FLJ - Foreign Language - Japanese Courses

FLJ 101 Elementary Japanese I 3.
Corequisite: FLJ 103.
Introduction to standard, formal Japanese. Emphasis on speaking and listening skills. Exposure to Japanese culture, reading, and writing.

FLJ 102 Elementary Japanese II 3.
Prerequisite: FLJ 101, Corequisite: FLJ 104.
Continuation of basic skills. Emphasis on speaking and listening skills; inclusion of Japanese cultural factors in communication. Some reading and writing.

FLJ 103 Elementary Japanese I Conversation 1.
Corequisite: FLJ 101.
Supplements conversational practice in FLJ 101. Students are encouraged to use their speaking skills in a variety of situations. Special attention is given to correcting and improving pronunciation and intonation.

FLJ 104 Elementary Japanese II Conversation 1.
Prerequisite: FLJ 101, Corequisite: FLJ 102.
Supplements conversational practice in FLJ 102. Extensive use of speaking skills in a variety of situations. Special attention given to correcting and improving pronunciation and intonation.

FLJ 201 Intermediate Japanese I 3.
Prerequisite: FLJ 102 or FLJ 105, Corequisite: FLJ 203.
Continuation of basic skills. Greater emphasis on reading and writing. More exposure to Japanese cultural traditions.

Prerequisite: FLJ 201, Corequisite: FLJ 204.
Continuation of the learning of the basic skills. Emphasis on reading and writing as well as on spoken Japanese and on cultural patterns of behavior.

Prerequisite: FLJ 102, Corequisite: FLJ 201, FLJ 202 or FLJ 301.
Practice in spoken Japanese through use of the language in a variety of situations. Increase vocabulary and develop fluency and ease in the structural patterns of the language. May be repeated for a maximum of three credit hours.

FLJ 204 Intermediate Japanese Conversation 1.

FLJ 301 Intermediate Japanese III 3.
Prerequisite: FLJ 202.
Continued study of Japanese language. Primary emphasis on spoken Japanese, but attention also given to reading, writing and culture.

FLJ 302 Intermediate Japanese IV 3.
Prerequisite: FLJ 301.
Continued training in the foundations of Japanese language. Primary emphasis on spoken Japanese, with increased attention to reading and writing.

FLJ 302 Advanced Japanese I 3.
Prerequisite: FLJ 302.
Continued training in the foundations of Japanese language, with emphasis on complex verb forms. Increased attention to reading and writing.

FLJ 402 Advanced Japanese II 3.
Prerequisite: FLJ 401.
Elaboration on grammatical forms learned in the previous courses with applications in reading and writing, combined with more sophisticated vocabulary and idioms and attention to development of natural reading skills.

Foreign Language - Latin (LAT)

LAT - Foreign Language - Latin Courses

LAT 101 Elementary Latin I 3.
Beginning course in Classical Latin, emphasizing elementary grammatical form and basic syntax. Readings based on brief selections from Roman authors, including Cicero and Catullus.

LAT 102 Elementary Latin II 3.
Continuation of Latin 101. Completion of the study of elementary grammar. Readings from a variety of Latin authors, including texts on mythological themes.
LAT 201 Intermediate Latin I 3.
Prerequisite: LAT 102.
Introduction to Latin prose and poetry. Emphasis on increased reading skill. Review of grammar fundamentals and exposure to new and more complex syntax. Examination of cultural significance of readings.

LAT 202 Intermediate Latin II 3.
Prerequisite: LAT 201.
Lyric poetry of Catullus and Horace emphasizing vocabulary, syntax, and techniques of Latin verse. Traditions and the evolution of lyric poetry and the social role of the Roman poet.

LAT 399 Directed Readings in Latin 3.
Prerequisite: LAT 202.
Advanced Latin language course introducing students to research methods in classical studies. Readings may include Vergil, Ovid, Livy, Cicero, or others. May be taken up to two times with different readings for credit.

Foreign Language - Persian (PER)

PER - PER Courses

PER 101 Elementary Persian I 3.
Elementary Persian 101 is a beginning course for students who have little or no prior knowledge of the language. It is designed to give the students an introduction to the phonology, morphology, and script of Persian which will develop, by the end of the semester, into outcome skills including the ability to read aloud and comprehend written texts from dictation, and carry on conversations at elementary levels. A textbook with grammar explanations in English is supplemented with tapes and videos of authentic language and culture used in situational communication.

PER 102 Elementary Persian II 3.
Prerequisite: Elementary Persian 101 (PER 101) or instructor's permission.
Elementary Persian 102 is the second-semester continuation of Persian 101. It continues and develops the students' familiarity with and command of the written and spoken forms of the language by actively involving them in communicative activities at the first-year level. A textbook with grammar explanations in English is supplemented with tapes and videos of authentic language and culture used in situational communication.

PER 201 Intermediate Persian I 3.
Prerequisite: Elementary Persian 102, or instructor's permission.
Persian 201 is the third semester (beginning of second-year) in Persian. It deepens the students' familiarity with the syntax of the literary language of Persia and expands their command of the spoken vernacular of Iran through exposure to more varied and sophisticated communicational contexts. An intermediate textbook with grammar explanations in English is supplemented with tapes and videos of authentic language and culture used in situational communication.

PER 202 Intermediate Persian II 3.
Prerequisite: Elementary Persian (PER 201) or instructor's permission.
Persian 202 is the fourth semester, which completes the intermediate level (second year) in Persian. It further deepens the students' familiarity with the syntax of the literary language of Persia and expands their command of the spoken vernacular of Iran through exposure to more varied and sophisticated communicational contexts. It deals principally with the acquisition of the conversation register of the language, which differs considerably from the formal written style. An intermediate textbook with grammar explanations in English is supplemented with tapes and videos of authentic language and culture used in situational communication.

Foreign Language - Portuguese (FLP)

FLP - Foreign Language - Portuguese Courses

FLP 101 Elementary Portuguese I 3.
Introduction to the fundamentals of Brazilian Portuguese: pronunciation, comprehension, and spoken syntax and grammar.

FLP 102 Elementary Portuguese II 3.
Prerequisite: FLP 101.
Continuation of the essentials of Brazilian Portuguese. Further stress on pronunciation and comprehension and introduction of reading and writing skills.

FLP 201 Intermediate Portuguese I 3.
Prerequisite: FLP 102 or placement in course.
The third level of Portuguese with special attention to speaking, reading, writing and developing a cultural awareness of the cultural heritage of the Portuguese-speaking peoples of Portugal, Brazil and Portuguese-speaking Africa.

FLP 202 Intermediate Portuguese II 3.
Prerequisite: Native/Heritage Spanish Speaker or FLS 202 or Equivalent and Instructor's Approval.
A one semester on-line intensive introductory course to Brazilian Portuguese for Spanish speakers taught in Spanish focusing on the development of: 1) Reading Comprehension in Brazilian Portuguese; 2) Basic translation skills: Spanish>Portuguese>Spanish; 3) Colloquial writing skills in Brazilian Portuguese; 4) Basic speaking ability in Brazilian Portuguese. This course is open to undergraduate, graduate and extension students with a formal knowledge of Spanish who fulfill the prerequisite. Instructor approval required.

Foreign Language - Russian (FLR)

FLR - Foreign Language - Russian Courses

FLR 101 Elementary Russian I 3.
First in a four-course sequence to develop language skills in Russian. Oral and written practice in the classroom and language laboratory and attention to Russian cultural heritage.

FLR 102 Elementary Russian II 3.
Prerequisite: FLR 101.
Emphasis on acquisition of basic oral skills, with complementary reading and writing exercises and attention to Russian cultural heritage.
FLR 201 Intermediate Russian I 3.
Prerequisite: FLR 102.
Basic Russian language skills continued. More emphasis given to writing and essential conversational practice. Intermediate level readings in Russian literature and culture. Class and laboratory practice; written assignments.

FLR 202 Intermediate Russian II 3.
Prerequisite: FLR 201.
Advanced aspects of Russian syntax through study of text. Continued attention to conversational practice and vocabulary building.

A study of selected plays, short stories and novels of the great Russian writers of the nineteenth century: Pushkin, Lermontov, Gogol, Goncharov, Turgenev, Dostoevsky, Saltykov-Shchedrin, Leskov, Tolstoy and Chekhov. Examinations of peculiarly Russian as well as the universal aspects of this literature. All readings, lectures and discussions in English.

FLR 304 Russian Literature in Translation: The Twentieth Century 3.
A study of selected poems, plays, short stories and novels by major Russian writers of the twentieth century, such as Chekhov, Gorky, Blok, Mayakovskiy, Esenin, Zamyatin, Olesha, Bulgakov, Babel, Plinyak, Pasternak, Solzhenitsyn, Evtushenko, and Voznesensky. All readings, lectures and discussions in English.

FLR 318 Russian Cinema and Society 3.
Russian culture and society through cinema. A study of selected films representative of major social-political, ideological, and artistic developments. Weekly film screenings. No knowledge of Russian required.

Foreign Language - Spanish (FLS)

FLS - Foreign Language - Spanish Courses

FLS 101 Elementary Spanish I 3.
For students with little or no background or previous study of Spanish or those who place into course via Spanish placement exam. Development of communicative abilities within an integrated skill approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

FLS 102 Elementary Spanish II 3.
Prerequisite: FLS 101.
Continuation of FLS 101. Development of communicative abilities within an integrated skills approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

FLS 105 Intensive Elementary Spanish 6.
An intensive course equivalent to FLS 101 plus FLS 102. Development of communicative abilities within an integrated skills approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

FLS 110 Accelerated Elementary Spanish 3.
Prerequisite: A score of 167 or better on the Spanish placement exam is required for matriculation in this course.
Contents of FLS 101 and FLS 102 at an accelerated pace, for students placed into the course based on results of the Spanish placement test. Development of communicative abilities within an integrated skills approach (speaking, listening, reading, writing). Introduction to the cultures of the Spanish-speaking world. Includes extensive written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

FLS 201 Intermediate Spanish I 3.
Prerequisite: FLS 102,105 or 110.
Continued development of communicative abilities for students with previous study of elementary level Spanish. Integrated skills approach (speaking, listening, reading, writing). Students will learn to function in everyday situations, expressing opinions and doubts, and narrating and describing in present, past, and future time, and will explore cultural issues through literary and other types of readings. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

FLS 202 Intermediate Spanish II 3.
Prerequisite: FLS 201 or FLS 212.
Development of communicative abilities at the intermediate level of the American Council on the Teaching of Foreign Language proficiency scale, with an integrated skills approach (reading, writing, speaking, listening) and additional emphasis on knowledge and competence in the cultures of the Spanish-speaking world. Includes written and oral assignments of language structures and vocabulary. Conducted entirely in Spanish. Closed to native speakers of Spanish.

FLS 212 Spanish: Language, Technology, Culture 3.
Prerequisite: FLS 102, FLS 110, or FLS 105.
A study of the language structures and vocabulary necessary for an intermediate level of communication in Spanish together with cultural and technical issues of our global society in the context of the Spanish-speaking world. Fulfills the FLS 201 requirement.

FLS 295 Intermediate Special Topics in Spanish 3.
Prerequisite: FLS 201.
Special Topics in language and cultures of the Spanish speaking world for students at the intermediate (200) level. Includes courses taught in Spanish study abroad programs. Course may be taken up to three times.

FLS 331 Spanish Oral and Written Expression I 3.
Prerequisite: FLS 202.
Development of speaking and writing skills at the Intermediate Mid to Intermediate High levels of the American Council on the Teaching of Foreign Languages proficiency scale, as well as listening/viewing and reading skills. Focus on sentence and paragraph-length discourse, narration and description in present, past, and future time frames within a variety of topics and contexts, and communication skills such as circumlocution. Course readings, video and discussion content center upon cultural aspects of the Spanish speaking world.
FLS 332 Spanish Oral and Written Expression II 3.
Prerequisite: FLS 202.
Development of speaking and writing skills at the Intermediate High levels of the American Council on the Teaching of Foreign Languages proficiency scale, as well as listening/viewing and reading skills. Focus on paragraph-length discourse, narration and detailed description in present, past, and future timeframes within a variety of topics and contexts, and communication skills such as circumlocution. Course readings, video and discussion content center upon cultural aspects of the Spanish speaking world.

FLS 333 The Sounds of Spanish 3.
Prerequisite: FLS 202.
A study of the pronunciation and phonological system of Spanish, with the goals of improving student pronunciation and analyzing native Spanish pronunciation. Extensive practice in phonetic transcription and pronunciation, as well as phonetic/phonological dialect variation.

FLS 335 Spanish for Native and Heritage Speakers 3.
Native or heritage speaker of Spanish with Advanced or Superior proficiency on the ACTFL Oral Proficiency Scale.
This course is designed to meet the needs of native and heritage speakers of Spanish whose linguistic level is above that of our 200-level courses. Development of oral and writing skills at the Advanced-Mid through Superior levels of the American Council on the Teaching of Foreign Languages proficiency scale.

FLS 336 Spanish for Business 3.
P: FLS 331 or FLS 335.
Business Spanish vocabulary and terminology. Emphasis on everyday spoken and written Spanish. Readings and discussions of business topics. Cross-cultural considerations relative to international business operations.

FLS 337 Spanish for Tourism in the Hispanic World 3.
Prerequisite: FLS 202.
Exploration of the tourism industry in the Spanish speaking world from cultural-historical, geographic, and linguistic perspectives. Course can lead to Tourism Certificate in Spanish from the Chamber of Commerce and Industry of Spain.

FLS 340 Introduction to Hispanic Literatures and Cultures 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Exploration of what literature is; what it means to read literature; and why one might be interested in analyzing literature. Introduction to literary terminology, as well as literary genres and movements in the Spanish language. Examination of social-cultural-historical contexts of Spain and Latin America, particularly matters of race, class, gender, and political ideas as they relate to literatures of the Spanish speaking world. Interpretation and analysis of literary texts, cultural institutions, and objects of national, mass, and popular cultures.

FLS 341 Literature and Culture of Spain I 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Survey of literary and cultural contexts of medieval and early modern Spain (12th to 17th centuries). Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Spanish society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

FLS 342 Literature and Culture of Spain II 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Survey of literary and cultural contexts of 18th and 19th century Spain. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Spanish society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

FLS 343 Literature and Culture of Spain III 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Survey of literary and cultural contexts of 20th and 21st century Spain. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Spanish society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

FLS 344 Literature and Culture of Latin America I 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Survey of literary and cultural contexts of Latin America from the pre-conquest, colonial and early-independence periods (15th to mid 19th centuries). Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Latin American society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

FLS 345 Literature and Culture of Latin America II 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Survey of literary and cultural contexts of Latin America from the Mid 19th to the Mid 20th centuries. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Latin American society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

FLS 346 Literature and Culture of Latin America III 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Survey of literary and cultural contexts of Latin America since 1960. Examination of literary genres in connection with concurrent cultural and historical events. Exploration of literature as a reflection of the experiences and events meaningful to Latin American society during this time period. Emphasis on the ways in which literature and other cultural artifacts give voice to value systems, traditions, and beliefs.

FLS 360 Hispanic Cinema 3.
Prerequisite: FLS 331 or FLS 332 or FLS 335.
Survey of the major contributions of Hispanic cinema from its origins to the present. Analysis of film as an artistic medium and as the cinematic representation of Hispanic histories and cultures. Reading, discussions, and viewing of films by representative directors.

FLS 395 Special Topics in Spanish 3.
Prerequisite: FLS 202.
Special Topics in language and cultures of the Spanish speaking world for students at the 300 level. Includes courses taught in Spanish study abroad programs. Course may be taken up to three times.
FLS 399 Intensive Spanish Oral Proficiency Workshop 1.
Prerequisite: 3 Hours of 300-level Spanish.
Extensive conversation centered upon the communicative functions of the intermediate high to advanced levels of the American Council on the Teaching of Foreign Languages (ACTFL) Oral Proficiency Scale. Assignments will include listening/viewing and speaking tasks to support in class activities. Designed to help Spanish majors to achieve the intermediate high oral proficiency level required for graduation. This is a 5-week course. Departmental permission is required.

FLS 400 Methods and Techniques in Spanish Translation and Interpretation 3.
Prerequisite: 12 credits of 300 level Spanish.
Study and practical application of theory, methods and techniques of translation based on materials relevant to various fields and professions.

FLS 401 Spanish Graduate Reading 3.
Basic Spanish grammar, with special attention to characteristics of formal expository style, and illustrative readings. Study of extracts from scholarly publications in students' areas of research. Prepares students to take the graduate foreign language certification exam.

FLS 402 Introduction to Spanish Linguistics 3.
Prerequisite: 12 credits of 300 level Spanish.
Introduction to fundamental terminology and concepts in the study of linguistics. Overview of the Spanish phonetics and phonology, morphology, syntax, semantics, pragmatics, sociolinguistics and historical linguistics.

FLS 405 Spanish-English Comparative Grammar 3.
Prerequisite: 12 credits of 300 level Spanish.
Analysis of the linguistic and grammatical structure (phonology, morphology, syntax, and discourse) of English and Spanish in order to develop a deeper understanding of how both linguistic systems function in similar and different ways.

FLS 411 Topics in the Culture of Spain 3.
Prerequisite: 12 credits of 300-level Spanish.
Exploration of particular themes related to the culture of Spain, with culture broadly defined as history, social and political aspects of society, as well as human and artistic expression including use of language, literary production, performance, print, and electronic media. Themes in this course expand upon those introduced in the 300 level of the Spanish curriculum. Class discussion and assignments require greater depth and sophistication than introduction to literature and culture courses of the 300 level.

FLS 412 Topics in the Culture of Latin America and the Caribbean 3.
Prerequisite: 12 credits of 300-level Spanish.
Exploration of particular themes related to the culture of Latin America and the Caribbean, with culture broadly defined as history, social and political aspects of society, as well as human and artistic expression including use of language, literary production, performance, print, and electronic media. Themes in this course expand upon those introduced in the 300 level of the Spanish curriculum. Class discussion and assignments require greater depth and sophistication than introduction to literature and culture courses of the 300 level.

FLS 413 Spain and the Americas in Transatlantic Perspective 3.
Prerequisite: 12 credits of 300-level Spanish.
Exploration of key moments of communication, exchange and conflict between the different parts of the Spanish speaking world, from the point of contact between imperial Spain and the indigenous civilizations of the “New World”. Examination of the commonalities and distinctions of the quest for independence, modernity and democracy. Analysis of immigration across national frontiers in the present day Hispanic World and greater American continent.

FLS 492 Seminar in Hispanic Studies 3.
Prerequisite: 12 credits of 300 level Spanish.
Advanced seminar on a specific area of Hispanic studies (topics vary), leading to a major term paper and/or a series of essays by the student.

FLS 495 Advanced Special Topics in Spanish 3.
Prerequisite: 12 credits of 300-level Spanish.
Advanced special topics in language and cultures of the Spanish speaking world for students at the 400 level. Includes courses taught in Spanish study abroad programs. Course may be taken up to three times.

FLS 502 Linguistic Structure of Spanish 3.
Introduction to fundamental terminology and concepts in the study of linguistics. Overview of the Spanish sound system (phonology), principles of word formation such as derivation and inflection (morphology), structure and grammatical relations of phrases and sentences (syntax), as well as the relationship between linguistic levels. Graduate standing required.

FLS 503 Spanish Applied Linguistics 3.
Prerequisite: FLS 502 (Linguistic Structure of Spanish).
Overview of prominent theoretical perspectives in the acquisition of Spanish as a second language. Application of theory to the learning and teaching of the Spanish language. Analysis of issues in the acquisition of Spanish phonology, morphosyntax, semantics, and pragmatics. Graduate standing required.

FLS 504 Spanish Language Change and Variation 3.
Prerequisite: FLS 502 (Linguistic Structure of Spanish).
Overview of phonological and morphosyntactic change from Latin to modern Spanish. Linguistic exploration of social and geographical dimensions Spanish language variation. Examination of issues of Spanish/English contact in the United States, including bilingualism and bilingual education. Graduate standing required.

FLS 509 Spanish Phonetics and Phonology 3.
Prerequisite: FLS 502 (Linguistic Structure of Spanish).
A theoretical introduction to the phonetics and phonological system of Spanish. Topics covered include articulatory phonetics, narrow and broad transcription, and the analysis of linguistic data with the goal of understanding the underlying system of Spanish sounds. Current topics in Spanish phonology are included. Graduate standing required.

FLS 515 History of Spanish Language 3.
Prerequisite: FLS 502 or equivalent; or permission of instructor.
Overview of historical evolution of modern Spanish from spoken Latin. Focus on theories of language change as applied to the historical development of Spanish. Graduate status or instructor permission required.

FLS 528 Don Quixote 3.
This course studies the historical and political contexts of Cervante's writing, his place in Renaissance culture, and the role of Don Quixote in the formation of the modern novel. Taught in Spanish. Graduate status or permission of the instructor.
FLS 530 The Cultural Production of Spanish Democracy 3.
Challenges, contradictions, accomplishments, and shortcomings in the political, social, economic, cultural, and literary dimensions of Spain in the last quarter of the 20th century. Treatment of literary texts, historical and journalistic documents, critical and theoretical essays, as well as fiction and non-fiction films, music, and other products of popular and mass culture since 1975. Particular attention to significant cultural events such as the 1992 Barcelona Olympics, and the celebration of the 500th anniversary of the "Discovery" of America. Must hold graduate standing.

FLS 553 The Latin American Avant-Garde 3.
An in-depth analysis of the cultural avant-garde in Latin America at the beginning of the twentieth century (1905-1939). Students will study European and Latin American theories of the avant-garde, literature, art, music, and manifestation from the period in several Latin American countries. Graduate standing required. Taught in Spanish.

FLS 554 The Sixties in Latin America 3.
An in-depth analysis of the cultural production during the 60s in Latin America. Students will study novels, short stories, poetry, music, and film from several Latin American countries. Graduate standing required.

FLS 563 The Latin American Novel 3.
The course offers a comprehensive view of Latin American novel (from the 19th Century until the present). It centers its attention foremost on canonical works (Isaacs, Gallegos, Vargas Llosa, Puig, etc.). Besides familiarizing students with the political, social and cultural contexts that gave rise to these texts, it also provides, through the reading of various theoretical articles, a basic introduction to narrative theory (Genette, Booth, Bal, Brooks, etc.). Graduate standing required.

FLS 592 Graduate Seminar in Hispanic Studies 3.
Prerequisite: Graduate standing in Hispanic Studies; M.A. students in Hispanic Studies.
A concentrated study of genres, periods or other special topics in Hispanic Studies to be determined as needed in the departmental program. Rotating topics on literature and/or culture; may be taken more than once for credit.

FLS 595 Special Topics in Spanish 3-6.
Prerequisite: Graduate standing.
In depth exploration of specialized topics in Spanish literature, culture or language. Also used to test and develop new courses. Course taught in Spanish.

FLS 630 Independent Study in Spanish 1-3.
Individualized study in Spanish language or literature at the graduate level. Topic and mode of study to be determined in consultation with the faculty member supervising work.

FLS 675 Special Project in Spanish 1-3.
Prerequisite: Student must be in final semester of his or her program.
Individual project in Spanish language or literature at the graduate level. Topic and mode of study to be determined in consultation with student's project advisory committee within the parameters of specific options.

FLS 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

Foreign Language-Classical Studies (CLA)

CLA - Foreign Language-Classical Studies Courses

CLA 110 Greek and Latin Roots of English 3.
Study of the formation of English words from Greek and Latin roots, designed to build English vocabulary and word power (Students who plan to enter medical professions should take CLA 115. Students may not receive credit for both CLA 110 and CLA 115.).

CLA 115 Medical Terminology 3.
Study of the formation of medical terms from their Greek and Latin roots designed both to build vocabulary and to teach the uses of a medical dictionary. Students may not receive credit for both CLA 110 and CLA 115.

CLA 210 Classical Mythology 3.
Greek and Roman mythology through the writings and art of the Classical period. Discussion of creation stories, the major gods and heroes, the underworld and afterlife, intellectual, religious and educational role of myth, and the most important theories of interpretation and classification. All readings and discussion in English.

CLA 215 The Ancient World in Modern Media 3.
Study of the ways classical myth and culture appear in modern media such as film, TV, comics, the internet and others, with focus on why ancient stories, ideas and images are still appealing, but also how and why they are used in new ways with new meanings.

CLA 320 Masterpieces of Classical Lit 3.
R: Sophomore Standing.
Study of great works of Greek and Latin Literature in a genre such as tragedy, comedy, epic or lyric, with attention to both literary merit and cultural importance. All readings in English. May be taken up to three times in different genres for credit.

CLA 325 Gender, Ethnicity & Identity in the Ancient World 3.
R: Sophomore Standing.
Study of the formation of ideas and practices regarding gender, ethnicity, and identity in the ancient Greek and Roman world, with attention to both continuities and difference between ancient and modern views.

CLA 395 Special Topics in Classical Studies 3.
For topics not part of regular course offerings, or offering of new courses on a trial basis. May be taken up to three times provided the topics are different.

CLA 398 Independent Study in Classical Studies 1-3.
R: Sophomore Standing.
Individualized study in classical language, culture or literature. Topic, mode of study, and credit hours to be determined in consultation with faculty member supervising work. May be taken up to three times provided the topic is sufficiently different. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Foreign Languages (FL)
FL - Foreign Languages Courses

FL 216 Art and Society in France 3.
An overview of the visual arts in France, defined broadly, and their relationship to French society and culture: painting, architecture, photography, cinema, book production, gardens, fashion, food, television, popular culture, and mass media, including the Internet. The principal themes of the course are how France's cultural heritage is embodied in its rich tradition of visual expression and how artists' visual expressions have either served to represent, glorify, or critique the nation.

FL 219 Studies in Great Works of Non-Western Literature 3.
Readings, in English translation, or non-Western literary masterpieces from the beginnings of literacy in the Middle East, Asia, and Africa to the modern period, including excerpts from texts such as the Upanishads, the Ramayana, the Sudiata, Gilgamesh, A Thousand and One Nights, and the Quran and such authors as Confucius, Oe Kenzaburo, Omar Khayyam, Rumi, and Amos Oz.

FL 220 Studies in Great Works of Western Literature 3.
Readings, in English translation, of Western literary masterpieces, from the beginnings of literacy in the Middle East and Europe towards the present, including such authors as Homer, Sophocles, Virgil, Ovid, Augustine, Dante, Machiavelli, Shakespeare, Cervantes, Moliere, Voltaire, Goethe, Austen, Flaubert, Dickinson, Tolstoy, Kafka, and Woolf. Credit will not be given for both ENG/FL 220 and either ENG/FL 221 or ENG/FL 222.

FL 221 Literature of the Western World I 3.
Readings from English translations of Biblical, Classical, Medieval, and Early Renaissance literature, including works by such authors as Homer, Plato, Virgil, Ovid, St. Paul, St. Augustine, Marie de France, and Dante.

FL 222 Literature of the Western World II 3.
Readings from English translations of Renaissance, Neo-Classical, Romantic, and Early Modern literature, emphasizing the cultures of continental Europe from the Renaissance to 1900, and including such authors as Petrarach, Erasmus, Rabelais, Machiavelli, Shakespeare, Moliere, Voltaire, Rousseau, Goethe, Flaubert, Tolstoy.

FL 223 Contemporary World Literature I 3.
Prerequisite: ENG 112.
Twentieth-century literature of some of the following cultures: Russian, Eastern European, Western European, Latin American, Canadian, Australian.

FL 224 Contemporary World Literature II 3.
Prerequisite: ENG 112.
Twentieth-century literature of some of the following cultures: Asian, Arabian, African, Caribbean, Native-American.

FL 246 Literature of the Holocaust 3.
Fictional and nonfictional versions of the Holocaust, focusing on themes of survival, justice, theology, and the limits of human endurance.

FL 295 Special Topics in Foreign Languages and/or Literatures 1-6.
A special projects course on topics to be determined as needed in the departmental program.

FL 298 Independent Study in Foreign Language or Literature 1-6.
Individualized study in a foreign language or literature. Topic, mode of study and credit hours to be determined in consultation with the faculty member supervising work. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FL 299 Field Experience for 21st Century Teaching 1.
Prerequisite: ECI 204 and ED 204.
This course has a required fieldwork component in local K-12 schools, and students are responsible for their own transportation to and from the schools. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. This course is restricted to Foreign Language Education majors.

FL 392 Major World Author 3.
Intensive study in English, of the writings of one (or two) author(s) from outside the English and American traditions. Sample subjects: Homer, Virgil and Ovid, Lady Murasaki, Marie de France and Christine de Pizan, Dante, Cervantes, Goethe, Balzac, Flaubert, Kafka, Proust, Lessing and Gordiner, Borges and Marquez, Neruda, Achebe, Soyinka, Calvino, Walcott and Naipaul. Topics will vary from semester to semester. May be repeated for credit with new topic.

FL 393 Studies in Literary Genre 3.
Concentrated treatment of one literary genre, such as the epic, the lyric, the drama, satire, romance, autobiography, the essay, the novel, or the short story. Treatment of materials from several national or ethnic cultures and several periods. All readings in English. Course may be taken three times for credit. Course may be taken 3 times in different genres.

FL 394 Studies in World Literature 3.
Prerequisite: ENG 111 and 112 or 113.
Study of a subject in world literature: for example, African literature, Asian literature, Hispanic literature, East European literature, Comedy, the Epic, the Lyric, Autobiography, the Faust legend, or Metamorphosis. Subjects vary according to availability of faculty. Readings in English translation.

FL 395 Study Abroad Programs 1-3.
Specific category of courses involving language and/or culture taught in foreign countries through the Department Study Abroad Program.

FL 406 Modernism 3.
International Modernist movement in literature, from its nineteenth-century origins to its culmination in the early twentieth century. Definitions of modernity, as embodied in a variety of genres. Placement of Modernist texts within a variety of cultures that produced them.

FL 407 Postmodernism 3.
Literary expressions of Postmodernism, from its origins in the Modernist movement through its culmination in the later decades of the twentieth century. Definitions of post modernity, as embodied in a variety of genres. Placement of Postmodernist texts within a variety of cultures that have produced them.

FL 424 Linguistics for ESL Professionals 3.
Prerequisite: Admission to ESL teacher licensure candidacy. Corequisite: NC teacher licensure in any area.
Study of the diachronic nature of language and the phonological, morphological, syntactic, and semantic features of English in relation to other world language groups. Application of linguistic principles to the ESL classroom. Analysis of English speech and writing patterns of non-native speakers. Examination of the ways children, adolescents, and adults learn a second language.
FL 425 Methods and Materials in Teaching English as a Second Language 3.
Prerequisite: Admission to ESL Teacher Licensure Program, Corequisite: NC teaching license in any area.
Methodologies and current approaches to teaching English as a Second Language. Techniques and strategies for teaching reading, writing, listening, speaking and culture. Selection, adaptation, and creation of instructional materials for various levels of proficiency and teaching situations. Evaluation and assessment of written and oral language proficiency through standardized and non-standardized assessment tools.

FL 439 Perspectives on English as a New Language 3.
Prerequisite: Admission to ESL Teacher Licensure, Corequisite: NC teaching license in any area.
Examination of the complexity of multiculturalism in American society and the challenges faced by immigrant families in adapting to U.S. institutions. Emphasis on understanding historical, legal, cultural and pedagogical issues with respect to learning English as a new language (ENL).

FL 440 Internship in Teaching English as a Second Language 3.
Prerequisite: Admission to ESL Licensure Program, Corequisite: Teacher Licensure in any primary area.
Skills and techniques required in teaching ESL in a public school setting. 15 hours of classroom observation and 30 hours in direct instruction. Demonstration of competencies essential for teaching ESL. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

FL 492 Senior Seminar in Foreign Languages & Literatures 3.
Prerequisite: FLJ 301 or FLC 301 or FLN 301 or FLA 301.
Senior seminar for foreign language majors with concentration in non-European / less-commonly taught languages. Focus on recent trends in scholarship, career guidance, senior research projects or equivalent. Conducted in English. Students will be required to provide a detailed summary of their project in the language of their concentration.

FL 495 Special Topics in Foreign Languages and Literatures 1-6.
A concentrated study of a special period, author or genre to be determined as needed in the departmental program.

FL 497 Senior Seminar in World Literature 3.
Prerequisite: Junior standing or Senior standing.
Rotating topics in world literature, including treatment of materials from more than one culture and including consideration of the subject's theoretical or methodological framework. Readings in English (original languages encouraged but not required).

FL 498 Independent Study in Foreign Language or Literature 1-6.
Individualized study of a foreign language or literature. Topic, mode of study, and credit hours to be determined in consultation with the faculty member supervising work. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FL 505 Issues and Trends in Foreign Language Education: Theory & Practice 3.
Prerequisite: Graduate standing.
An exploration of theory and practice issues related to foreign language teaching. Inquiry into proficiency-oriented instruction, innovative methodological approaches, the National Standards and learning scenarios, integrating culture, options for testing and assessment, content-based instruction, the role of grammar in second language acquisition, teaching foreign language students with learning disabilities, and Foreign Language in the Elementary School (FLES) in North Carolina. Students will examine case studies related to these topics and engage in a classroom action research project.

FL 506 Instructional Technology in Foreign Language Education: Addressing the National 3.
Prerequisite: Graduate standing.
Hands-on experience in appropriately selecting and applying a number of instructional technologies to foreign language teaching and learning in relation to the current National Standards. Analysis and use of effective technology tools including hardware, software, and courseware. Emphasis will be on the application of Technology-Enhanced Language Learning (TELL) as it integrates the National Standards' goals of Communication, Cultures, Connections, Comparisons, and Communities.

FL 507 College Teaching of Foreign Languages 3.
Prerequisite: Graduate status.
Principles of second language acquisition and foreign language pedagogy. Examination of problematic concepts in teaching Spanish and French. Thorough treatment of instructional technology appropriate to foreign language teaching and learning. Regular observation of practicing instructors and micro-teaching in college-level Spanish or French classes. Credit not given for both FL 507 and either FL/ECI 505 or FL/ECI 506. Course taught in English. Required for new FLL Teaching Assistants.

FL 508 Second Language Acquisition Research: Interlanguage Development 3.
Prerequisite: Graduate Standing or Permission of the Instructor.
This course introduces students to the objectives, methods, and findings of research investigating how classroom learners acquire French and Spanish as a second language. It examines specific features of French and Spanish interlanguage including: grammatical gender, copular ser/estar and idiomatic uses of etre/avoir, pronominalization, verbal systems, and longitudinal/cross-sections studies of interlanguage development. Course content bridges the gap between second language acquisition research, foreign language teaching methodology courses, and curriculum implementation. Graduate standing or consent of instructor required.

FL 539 Seminar In World Literature 3.
Prerequisite: Graduate Standing or Permission of the Instructor.
Rotating topics in world literature, including treatment of the subject's theoretical or methodological framework. Possible subjects: colonialism and literature; orality and literature; the Renaissance; the Enlightenment; translation; comparison of North and South American literature; African literary traditions; post-modernism and gender. Readings in English (original languages encouraged but not required).

FL 541 Literary and Cultural Theory 3.
A survey of literary theory in the 20th century from New Criticism to postmodernism. Examines the virtues and pitfalls of these approaches to the study of culture and literature. A course on issues, concepts, theorists and the sociohistorical and political context in which the theorists are writing. Taught in English. No formal pre-requisites. However, students who have not had advanced literature will be disadvantaged.
Foreign Languages and Literatures - Arabic (FLA)

FLA - Foreign Languages and Literatures - Arabic Courses

FLA 101 Beginning Arabic 101 3.
Beginning Arabic is for students who have had no prior experience with the language. It is the first in a series of courses which develop reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. Authentic materials from the Arabic media will be used in addition to text-related video and audio materials. An introduction to Arab culture will be integrated throughout the semester. This course is designed for true beginners who have had no previous experience with the Arabic language, either written or spoken. Credit will be awarded for either FLA 101 or FLA 111, but not for both.

FLA 102 Beginning Arabic 102 3.
Prerequisite: FLA 101 or 111.
This course is the second in a series which develops reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. Authentic materials from the Arabic media will be used in addition to text-related video and audio materials. An introduction to Arab culture will be integrated throughout the semester. Credit will be awarded for either FLA 102 or FLA 112, but not for both.

FLA 103 Beginning Arabic 101 Conversation 1.
Corequisite: FLA 101.
Supplements conversational practice for FLA 101 to help students develop oral proficiency at the beginning level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in basic social situations.

FLA 104 Beginning Arabic 102 Conversation 1.
Prerequisite: FLA 103; Corequisite: FLA 102.
Supplements conversational practice for FLA 102 to help students develop oral proficiency at the advanced beginning level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in basic social situations.

FLA 201 Intermediate Arabic I 3.
Prerequisite: FLA 102 or FLA 112.
Intermediate Arabic I is the third in a series of courses which develop reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. An increased emphasis is placed on the acquisition of vocabulary and grammatical tools necessary to undertake more in-depth readings and discussions of news articles from the Arab media. Authentic materials from the Arab media will be used in addition to text-related video and audio materials.

FLA 202 Intermediate Arabic II 3.
Prerequisite: FLA 201.
Intermediate Arabic II is the fourth in a series of courses which develop reading and writing skills in Modern Standard Arabic with active speaking and listening skills in both formal Arabic and the Egyptian dialect. A continued emphasis is placed on the acquisition of vocabulary and grammatical tools necessary to undertake more in-depth readings and discussions of news articles from the Arab media. Authentic materials from the Arab media will be used in addition to text-related video and audio materials.

FLA 203 Intermediate Arabic Conversation I 1.
Prerequisite: FLA 102.
Supplements conversational practice for FLA level 201 or higher. This course helps students develop oral proficiency at the intermediate level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in various social situations.

FLA 204 Intermediate Arabic Conversation II 1.
Prerequisite: FLA 201.
Supplements conversational practice for FLA level 202 or higher. This course helps students develop oral proficiency at the intermediate high level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in various social situations.

FLA 301 Advanced Intermediate Arabic I 3.
Advanced Intermediate Arabic I is the fifth in a series of courses which develop whole language skills in Modern Standard Arabic with active speaking and listening skills in the Egyptian dialect. Upon completion of this course the student will have the tools necessary to understand and produce all the basic structures of Modern Standard Arabic. Arabic film and media will be used in class. The student will also be introduced to selected short stories from modern Arabic literature.

FLA 302 Advanced Intermediate Arabic Conversation 1.
Supplements conversational practice for FLA level 202 or higher. This course helps students develop oral proficiency at the advanced intermediate level. Students will practice using their speaking skills in a variety of individual and group activities to build competency in various social situations.

FLA 318 Egyptian Culture through Film 3.
This course offers a survey of cinema in modern Egypt using film as a medium to learn about the cultural and social structures in Egypt. The course incorporates weekly screenings of feature films representing different styles and periods. Students will be required to take relevant material, write film reviews, and give a presentation of their final paper. The course is taught in English.

FLA 330 Media Arabic 3.
Prerequisite: FLA 202.
An introduction to the language of print and Internet news media of the Arab world, using authentic materials from Arabic newspapers, Internet news sites, and magazines. This course provides students with the tools necessary to build a core media vocabulary base, comprehend front page news stories, read critically, and detect bias, in selected news content, and develop listening skills necessary for understanding oral news reports.

FLA 440 Modern Arabic Short Story 3.
Prerequisite: FLA 301 or FLA 330.
An advanced language skills course which introduces students to contemporary Arabic literature through selected readings of modern Arabic short stories. Students will develop an understanding of this rich literary genre as a reflection of concurrent social structures, political landscapes, and cultural traditions in Middle Eastern societies. Emphasis will also be placed on recognizing advanced grammatical structures in Modern Standard Arabic with attention given to the increased use of vernacular expression in modern literary works. Assigned readings, writing assignments, and class discussions will be in Arabic.

Forestry (FOR)
FOR - Forestry Courses

FOR 150 Critical Thinking and Data Analysis 2.
Exploration and practical experience with basis for making resource management decisions. Learning to pose questions that drive research and analysis. Discovering differences between found and built answers. Examining spreadsheet structure and functionality for manipulating data. Establishing solid grounds for conclusions and actions in natural resources contexts. Experiencing thinking processes from posing questions to articulating well-founded answers in coherent, persuasive discourse.

FOR 172 Forest System Mapping and Mensuration I 2.
Concepts and application of basic forest and land resource measurement techniques used in forestry and related fields. Measuring distances and areas; orienteering; basic air photo and topographic map interpretation; introduction to GPS; measuring tree characteristics; introduction to forest sampling. Application of spreadsheets and word processing to analyze and summarize resource characteristics. Field trip required.

FOR 204 Silviculture 2.
Prerequisite: Summer camp eligibility.
Silvical characteristics and growth requirements of forest trees; dynamics of stand growth, species-site relationships, site productivity, forest pest interactions, hydrology and nutrient cycling in forest ecosystems; emphasis on understanding and applying ecological principles to the production of multiple benefits at the forest community level.

FOR 220 Urban and Community Forestry 3.
Introduction to the interdisciplinary study of urban forestry and greenspaces. Study of urban forest history, distribution and ownership patterns, urban ecology and ecosystems, benefits and uses of urban forests, vegetation establishment and maintenance, urban planning and policy, community interactions, urban forestry implementation.

FOR 248 Forest History, Technology and Society 3.
Examining forest resource use and issues throughout history. Tracing developments and concepts that created the context for today’s issues concerning global forest resources. Examining how wood resource availability shaped civilization’s development, and examining consequences on forest resources of civilization’s scientific, social, and technological progress.

FOR 250 Professional Development II: Communications in Natural Resources 1.
Development of written and oral communication skills for forestry and natural resources management. Discussion topics include interactive communication, writing to a target audience, common pitfalls in technical writing, various kinds of technical writing, poster and oral presentations, reviewing and revising writing, and responding to questions in a professional manner.

FOR 252 Introduction to Forest Science 3.
Not open to Forest Management Majors (15FOMND, 15FORMTBS, 15FGM).
Integration of biological principles into studies of tree growth, reproduction, establishment, survival, and disturbance. Discussions of regional silviculture and of effects of humans on forest ecosystems. Instruction in forest sampling and tree identification. Many laboratories meet outdoors. Not open to Forest Management majors.

Introduction to forest ecosystems, their structure and functions, and the processes that regulate them including: radiation, temperature, water, and biogeochemistry; productivity; plant populations; forest communities; succession; natural disturbances; and human influences. Must have a strong love of trees.

FOR 261 Forest Communities 2.
Prerequisite: FOR 339 or PB 220 or PB 403.
Study of the species composition, distribution, site requirements, and succession of the principal forest communities of southeastern North America. Identification of important member plant species. Field trips to typical examples.

FOR 264 Forest Wildlife 1.
Prerequisite: Summer camp eligibility.
Diversity of fauna that inhabits forest communities in the Piedmont of North Carolina. Inventory terrestrial and aquatic habitats and identify various vertebrate and invertebrate species. Insect collection initiated. The life histories of representative species presented.

FOR 265 Fire Management 1.
Prerequisite: Summer camp eligibility.
Effects of wildfire and prescribed fire on forest ecosystem components and processes; fire behavior and the ecosystem and meteorologic factors that affect it; silvicultural uses of fire; organization, equipment, and tactics for wildfire suppression; fire suppression exercises on the North Carolina Division of Forest Resources’ Forest Fire Simulator.

FOR 273 Forest System Mapping and Mensuration II 3.
Prerequisite: FOR 172.
Procedures and Instruments for measuring various tree and stand characteristics. Determination of stem volume and taper. Planning and implementation of forest resource samples to provide population estimates using fixed-radius and variable-radius sampling. Detailed coverage of land measurements and mapping of boundary surveys. Use of aerial photography, topographic maps, and GPS to aid in resource assessment. Incorporation of inventory data into a GIS. Basic statistical concepts applied to resource measurements. Taught off-campus at Hill Forest.

FOR 293 Independent Study in Forest Management 1-6.
Independent Study for Forest Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FOR 294 Independent Study in Forest Management 1-6.
Independent Study for Forest Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FOR 295 Special Topics in Forestry 1-6.
Study of forestry topics not covered in existing courses at the introductory level. Development of a new course on a trial basis.
FOR 303 Silvics and Forest Tree Physiology 3.
Prerequisite: (CH 101 or 103) and [(CH 201 and 202) or (CH 203 and 204) or PY 205 or PY 211].
Ecological and physiological processes influencing establishment, growth, and development of forest stands with particular emphasis on forest types of Southeastern United States; influence of resource availability on forest stand productivity; physical and biochemical processes associated with tree function, including water relations, mineral nutrition, transport and translocation, photosynthesis, respiration; internal and environmental factors regulating tree growth and development.

FOR 304 Theory of Silviculture 4.
Prerequisite: FOR 260.
Ecological processes affecting the establishment and growth of forest stands with particular emphasis on forest types of the Southeastern United States. Forest stand productivity, how productivity is influenced by site, stand, climatic factors, and the application of site specific prescriptions to establish and manipulate the composition, growth, and health of forest stands.

FOR 318 Forest Pathology 3.
Prerequisite: PB 200.
Major diseases of forest trees and deterioration of wood products emphasizing principles of plant pathology; diagnosis; nature, physiology, ecology, and dissemination of disease-causing agents; mechanisms of pathogenesis; epidemiology and environmental influences; principles and practices of control.

FOR 319 Forest Economics 3.
Prerequisite: ARE 201 or EC 205 or EC 201.
Economic approaches for evaluating the production and costs of forest management, timber harvesting activities, and nontimber forest products. Estimating the financial returns of long-term investments in timber or other forest resources, including discounted cash flow analysis and capital budgeting techniques. Property taxes and income tax treatment of timber and their effects on investment returns. Demand estimation and timber supply analyses.

FOR 330 North Carolina Forests 3.
An introduction and overview of forests in North Carolina with emphasis on the importance of forests in the 21st century. Topics include: history and distribution of forests, soils-sit relationships, forestry practices, non-conventional management objectives. Two required Saturday field trips.

FOR 334 Operations Research Applications in Natural Resources 1.
Introduction to the application and use of management science in forestry and natural resources. The course will introduce decision and information theory and mathematical programming techniques including linear, non-linear and integer programming concepts. The emphasis is on problem formulation and solution using computer programs. Half semester course.

FOR 339 Dendrology 4.
Identification and elementary silvics of woody plants of eastern North America with studies of their classification, characteristics, and habitats. Consideration of trees from northern and western North America and the Caribbean region. Field identification with trips to forest communities.

Prerequisite: Junior standing.
Study of ethical issues confronting natural resource management professionals, including: biodiversity conservation, private property rights, traditional religion and ecological values, community rights, environmental racism, hunting and animal rights, business ethics, and the purpose and content of professional codes of ethics.
FOR 420 Watershed and Wetlands Hydrology 4.
Prerequisite: SSC 200, BIO 360.
Principles of hydrologic science; classification and assessment of watersheds and stream networks; hydrologic, erosion, and water quality processes in natural and managed watersheds; wetlands hydrology; hydrologic measurements and data analysis; applications of hydrology and water quality management for forest agriculture, and urban ecosystems; watershed restoration. Emphasis field study of watersheds and hydrologic measurements. Two weekend field trips are required. Credit will not be given for both FOR(NR)420 and FOR(NR)520.

FOR 422 Consulting Forestry 3.
Prerequisite: Senior standing in Forest Management.
Forest land acquisition and ownership: ownership, appraisal, legal considerations, financial management and planning. Producing forest resources: timber, wildlife, recreation, farm products, water, minerals, specialty products, and development. Marketing forest resources: timber, recreation, farm leases, minerals, specialty products, and developed property. Forest resources consulting: forms of organization, pricing of services, consultant client relationships (Law of Agency), professional ethics and continuing education.

FOR 430 Forest Health and Protection 3.
Prerequisite: PB 200 or BIO 181 or BIO 183 or FOR 260 or BIO 360 or PB 360 (or other Biology or Plant Biology course). This course will introduce students to the major insect and disease problems of North American forests, both native and introduced, with an emphasis on the recognition and management of pests and the damage they cause. Wild land fire, invasive plants, and climate change and their interactions with forest insect and diseases will also be covered.

FOR 434 Forest Operations and Analysis 3.
Junior standing or above.
Management science and operational techniques in forestry. Logging road layout and construction, and machine systems: harvesting machine optimization and selection. Harvesting, production and forest planning, Decision and inventory theory, and other techniques for solving problems typically encountered in forest operations management. Required overnight weekend field trip.

FOR 450 Professional Development IV: Leadership 1.
Prerequisite: Junior standing.
Concepts and applications of leadership principles with emphasis on leadership challenges and opportunities for professionals in natural resource management. Assessment and development of leadership skills.

FOR 491 Special Topics in Forestry and Related Natural Resources 1-4.
Independent (or group) study or research of a forestry or related natural resources topic with a faculty supervisor of the student's choice. Also courses offered on a trial basis.

FOR 493 Independent Study in Forest Management 1-6.
Independent Study for Forest Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FOR 494 Independent Study in Forest Management 1-6.
Independent Study for Forest Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

FOR 501 Dendrology 3.
Prerequisite: PB 200.
Identification and natural history of eastern woody species with studies of their taxonomic classification, physical characteristics, and typical habits. Laboratories stress site recognition and use of identification keys and trips to natural forest communities.

FOR 502 Forest Measurements 1.
One-third semester mini-course. Forest measurements covering principles, terminology, and practical field applications. Land area measurement, units of timber measure (cubic feet, cords, weight, board feet), estimating volume of standing trees, sampling techniques for forest inventory (strips, plots, points), measures of site quality and stand density, methods for projecting future timber volumes.

FOR 503 Tree Physiology 1.
Prerequisite: Graduate standing.
One-third semester mini-course. Fundamental principles of physiological processes in forest trees affecting tree and stand growth and development in natural forests and managed plantations. Concepts of whole plant physiological processes including photosynthesis, respiration, water relations, nutrition, periodic growth, sexual and vegetative reproduction, and seedling quality with forestry examples of each process.

FOR 505 Forest Management 4.
Fundamental principles and analytical techniques necessary in planning, management and optimization of forest operations. Formulation of objectives and constraints, yield forecasting, forest regulation, procurement and marketing, inventory methods, and management plan preparation. Written and oral reporting. Credit not allowed for both FOR 505 and FOR 405.

FOR 507 Silviculture Mini Course 1.
One-third semester mini-course. A condensed version of silviculture. Ecological processes affecting establishment and growth of forest stands with particular emphasis on forest types of southeastern United States. Forest stand productivity, how productivity influenced by site, stand, climatic factors, and application of site specific prescriptions to establish and manipulate composition, growth, and health of forest stands.

FOR 509 Forest Resource Policy 1.
One-third semester mini-course. Principles of forest policies and processes. Political processes, institutional and interest group participation, forestry laws and programs, current issues, and policy analyses.

FOR 510 Introduction to GPS 1.
One-third semester mini-course. Introduction to collection and use of mapping grade global positioning satellite systems data. Includes review of cartographic properties, mission planning, hands-on collection of GPS points, lines, and areas, differential correction, editing, and exporting GPS files to a GIS.

FOR 513 Silviculture for Intensively Managed Plantations 3.
Prerequisite: FOR 507.
This course provides an up-to-date understanding of the ecological and physiological bases of forest stand productivity and a silvicultural systems framework to use this knowledge for making site specific prescriptions that are cost effective and environmentally sustainable.
FOR 519 Forest Economics 3.
Prerequisite: Basic course in economics.
Economics applied to problems in forest management, including timber demand and supply models, optimal rotation length, benefit-cost analysis of forestry projects, impacts of forest taxation and consideration of non-market forest goods and services.

FOR 520 Watershed and Wetlands Hydrology 4.
Prerequisite: SSC 200, BIO 360.
Principles of hydrologic science; classification and assessment of watersheds and stream networks; hydrologic, erosion, and water quality processes in natural and managed watersheds; wetlands hydrology; hydrologic measurements and data analysis: applications of hydrology and water quality management for forest, agriculture, and urban ecosystems; watershed restoration. Field study of watersheds and hydrologic measurements. Two weekend field trips required. Credit for both FOR(NR) 420 and FOR(NR) 520 is not allowed.

FOR 522 Consulting Forestry 3.
Prerequisite: Graduate standing.
Forest land acquisition and ownership: ownership, appraisal, legal considerations, financial management and planning. Producing forest resources: timber, wildlife, recreation, farm products, water, minerals, specialty products, and development. Marketing forest resources: timber, recreation, farm leases, minerals, specialty products, and developed property. Forest resources consulting: forms of organization, pricing of services, consultant client relationships (Law of Agency), professional ethics and continuing education. To receive graduate credit, a student must write a term paper on a topic mutually agreed upon with the instructor. Credit for both FOR 422 and FOR 522 is not allowed.

FOR 531 Wildland Fire Science 3.
Physical, chemical, biological, and ecological processes associated with wildland fire, particular emphasis on fire behavior, fuels, weather, climate and the associated effects on ecology, management, fire suppression, prescribed fire, and smoke emissions and exposure. Fire's effect on national policy, social and natural history of North America. In-depth exercises in fire and smoke modeling using established predictive systems.

FOR 534 Forest Operations and Analysis 3.
Management science and operational techniques in forestry. Road layout, construction, and machine systems: harvesting machine optimization and selection. Harvesting, production and forest planning. Linear programming, queuing, decision and inventory theory, and other techniques for solving problems typically encountered in forest operations management. Credit not allowed for both FOR 534 and FOR 434.

FOR 540 Advanced Dendrology 3.
Prerequisite: BO 403 or FOR 339.
Identification and life histories of native and naturalized woody plants. Use of taxonomic manuals and literature. Identification of problematic groups. Concentration on North America, with discussion of other continents. Overnight field trips to natural forest communities.

FOR 561 Forest Communities of the Southeastern Coastal Plain 1.
Prerequisite: FOR 212, FOR 501.
Species composition, distribution, site requirements, and succession of principal forest communities of southeastern Coastal Plain. Identification of important member plant species. Overnight field trips to typical examples.

FOR 562 Forest Communities of the Southern Appalachians 1.
Prerequisite: FOR 212, FOR 501.
Species composition, distribution, site requirements, and succession of principal forest communities of southern Appalachians. Identification of important member plant species. Overnight field trips to typical examples.

FOR 575 Advanced Terrestrial Ecosystem Ecology 3.
Views organisms and physical environment as integrated system. Outlines processes governing assimilation and cycling of energy, carbons, nutrients, and water. Evaluates ecosystem responses to intensive management, global climate change, air pollution, biofuels production, fragmentation, large-scale land use change. Illustrates application of ecosystem science approach to important regional and global questions through scaling of empirical, ecosystem-level data, ongoing research. Provides experience in hypothesis testing and experimental design, data analysis and interpretation, proposal development, and publication for research professionals. Graduate Standing.

FOR 583 Tropical Forestry 3.
Prerequisite: Senior standing.
Principles of tropical ecology, dendrology and agroforestry. Primary emphasis on establishment and management of tropical plantations with lesser emphasis on natural stands. Operation and management of tropical nurseries.

FOR 595 Special Topics 1-6.
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis. Also used to develop and test new 500-level courses.

FOR 601 Graduate Seminar 1.
Weekly seminar in which students registered for course present the results of research and special projects. Invitation to all graduate students and faculty in department to attend and join discussion.

FOR 603 Research Methods in Forestry and Environmental Resources 1.
Prerequisite: Graduate standing.
Philosophy and objectives of scientific research and steps in the research process. Basic and applied research, inductive and deductive reasoning and need for hypothesis development and testing as a basis for scientific research. Special emphasis on preparation of study plans, graduate theses, published articles and technical presentations.

FOR 610 Special Topics In Forestry 1-6.
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis. Also used to develop and test new 500-level courses. Credits Arranged.

FOR 620 Woodland Stewardship 3.
An introduction and overview of non-industrial private forestry in the Southeast United States with emphasis on active forest management. Topics include history of human impact on forests, evolution of forest, forestry practices, timber and non timber management objectives, financial aspects of forest land management, and management planning. One required all day field trip.
FOR 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

FOR 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

FOR 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

FOR 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

FOR 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

FOR 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

FOR 698 Master's Thesis Preparation 1-9.
Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

FOR 713 Advanced Topics In Silviculture 3.
Prerequisite: FOR 304.
Critical examination of selected silvicultural topics, with special emphasis on concepts and phenomena distinguishing forests from other biotic communities and silviculture from other fields of applied biology. Emphasis on intensive silviculture in United States and selected international locations. A required written research proposal.

FOR 725 Forest Genetics 3.
Application of genetic principles to silviculture, management and wood utilization. Emphasis on variation in wild populations, the bases for selection of desirable qualities and fundamentals of controlled breeding.

FOR 726 Advanced Topics In Quantitative Genetics and Breeding 3.
Prerequisite: ST 511, Corequisite: ST 512.
Advanced topics in quantitative genetics pertinent to population improvement for quantitative and categorical traits with special applications to plant and animal breeding. DNA markers - phenotype associations. The theory and application of linear mixed models, BLUP and genomic selection using maximum likelihood and Bayesian approaches. Pedigree and construction of genomic relationships matrices from DNA markers and application in breeding.

FOR 727 Tree Improvement Research Techniques 3.
Prerequisite: FOR 411 or GN 411.
Research methods involved in forest tree breeding and genetics programs. Emphasis on laboratory, greenhouse and field research techniques. Stress also on summary and presentation of research results.

FOR 728 Quantitative Forest Genetics Methods 3.
Prerequisite: GN 703, ST 701.
Applications of basic quantitative genetic methods in forest tree breeding and genetic research. Principles and procedures for partitioning experimental variance, estimating genetic parameters from different mating and test designs. Predicting breeding value and gain and developing breeding strategies.

FOR 734 Advanced Forest Management Planning 3.
Prerequisite: FOR 405 or FOR 434 or OR 501, Corequisite: FOR 772.
History, principles, structures and use of modern forest management planning and decision-making techniques. Emphasis on optimization procedures and public forest management.

FOR 750 Ecological Restoration 3.
Prerequisite: BO 360, SSC 200, Corequisite: BO 565.

FOR 753 Environmental Remote Sensing 3.
Prerequisite: FOR 353.
Principles and applications of remote sensing technology to earth resources and environmental studies. Electromagnetic energy, data acquisition platforms, sensors and scanners, processing of digital remotely sensed data, error analysis and accuracyassessments, and integration of remotely sensed data with other data types used in natural resource management.

FOR 784 The Practice Of Environmental Impact Assessment 4.
Impact assessment principles, practices and their evolution. Lectures and field practicums concerning problems addressed by environmental assessment practitioners. Practical implications of current regulatory requirements, especially concerning endangered species and wetlands, as they affect environmental practitioners' performance. Required reports combine varied technical tasks and documentation for regulatory process review.

FOR 795 Advanced Special Topics in Forestry 1-6.
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis. Also used to develop and test new 700-level courses.

FOR 801 Seminar 1.
Weekly seminar in which students registered for course present the results of research and special projects. Invitation to all graduate students and faculty in department to attend and join discussion.
FOR 803 Research Methods in Forestry and Environmental Resources 1.  
Prerequisite: Grad. standing.  
Philosophy and objectives of scientific research and steps in the research process. Basic and applied research, inductive and deductive reasoning and need for hypothesis development and testing as a basis for scientific research. Special emphasis on preparation of study plans, graduate theses, published articles and technical presentations.

FOR 810 Special Topics In Forestry 1-6.  
Individual students or groups of students, under direction of a faculty member, may explore topics of special interest not covered by existing courses. Format may consist of readings and independent study, problems or research not related to thesis. Also used to develop and test new 800-level courses.

FOR 885 Doctoral Supervised Teaching 1-3.  
Prerequisite: Doctoral student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

FOR 890 Doctoral Preliminary Exam 1-9.  
Prerequisite: Doctoral student.  
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.  
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.  
Dissertation research.

FOR 896 Summer Dissertation Research 1.  
Prerequisite: Doctoral student.  
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.  
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

GES 508 Emerging Technologies and Society 3.  
Provides frameworks for understanding emerging technologies and their social, political, and cultural contexts. Presents historical case studies, ethnographic accounts, and theoretical perspectives that introduce students to ways of thinking about science and technology, nature and culture, and democracy and expertise. Graduate standing is required.

GES 591 Special Topics in Genetic Engineering and Society 1-6.  
Special topics and experimental course offerings in Genetic Engineering and Society.

Genetics (GN)  

GN - Genetics Courses  

GN 301 Genetics in Human Affairs 3.  
Appreciation and understanding of genetics in everyday life. Genetic perspective on normal human development, birth defects, birth control, cancer, organ transplants, intelligence, mental illness, and radiation and chemical exposure and issues raised by applications of recently developed genetic techniques such as in vitro fertilization, genetic engineering and prenatal monitoring.

GN 311 Principles of Genetics 4.  
Prerequisite: BIO 183 or ZO 160.  
Basic concepts and principles of prokaryotic and eukaryotic genetics. Mendelian inheritance, polygenic inheritance, linkage and mapping, chromosome aberrations, population genetics, evolution, DNA structure and replication, gene expression, mutation, gene regulation, extranuclear inheritance, bacterial and viral genetics, and recombinant DNA technology.

GN 312 Elementary Genetics Laboratory 1.  
Corequisite: GN 311.  
Genetic experiments and demonstrations using a variety of bacterial, plant and animal organisms. Mendelian inheritance, linkage analysis, population genetics, cytogenetics, biochemical genetics, DNA isolation, electrophoresis, and Southern blotting.

GN 421 Molecular Genetics 3.  
Prerequisite: C- or better in GN 421.  
Biological macromolecules and their interactions, DNA topology, eukaryotic genome structure, chromatin and chromosome structure, transcription and transcription regulation, epigenetics, RNAi and RNA processing, recombinant DNA technology, genetic transformation and cloning of plants and animals. Bacteria, viruses, plants, animals and fungi as genetic systems. Students cannot receive credit for both GN 421 and GN 521.

GN 423 Population, Quantitative and Evolutionary Genetics 3.  
Prerequisite: GN 311 and (MA 131 or MA 141).  
This course is an introduction to population, quantitative and evolutionary genetics. This course will acquaint students with basic population genetics models. The course will cover genetic variation; measures of genetic variation; basic and advanced topics of selection; ecological genetics; inbreeding; genetic drift and effective population size; mutation; neutral theory and coalescence; gene flow and population structure; linkage disequilibrium and recombination; quantitative genetics; heritability; quantitative trait loci; molecular population genetics and evolution.

Genetic Engineering and Society (GES)  

GES - Genetic Engineering and Society Courses  

GES 506 Principles of Genetic Pest Management 3.  
Introduction to the biological aspects of genetic pest management (GPM). Genetic techniques for GPM, including historical uses (such as the sterile insect technique) and approaches that are currently in development. Practical issues relating to the deployment of GPM, including ecological and economic considerations.
GN 425 Advanced Genetics Laboratory 2.  
Prerequisite: GN 312; Corequisite: GN 421.  
This is a challenging advanced genetics laboratory designed to provide research and communication training and in-depth understanding of modern genetics through hands-on activities. Students will participate in a semester-long supervised research project in contemporary genetics using a model genetic organism and state-of-the-art techniques. The project will be directly related to research in the coordinating faculty member's laboratory. The project will require literature review, hypothesis development, experimental design and execution, data analysis and presentation of results in written and oral form.

GN 427 Introductory Bioinformatics 3.  
Prerequisite: GN 311 and (MA 131 or MA 141) with grades of C- or better.  
This course is an introduction to bioinformatics for genetic and biological sciences. The course will provide a foundation in biological computing that includes command line interfaces, reformatting data, creating and editing graphics, automating analyses and database access, and scripting in biological programming languages used for bioinformatics such as Python, Perl, and R. Laptop required.

GN 434 Genes and Development 3.  
Prerequisite: C- or better in GN 421.  
Genes and genetic pathways that control development in animals; overview of early, pivotal experiments in embryology and genetics; use of molecular biology, genomics and bioinformatics to study genes and development; concentration on four model systems; presentation and discussion of major issues in developmental biology.

GN 441 Human and Biomedical Genetics 3.  
Prerequisite: C- or better in GN 421.  
This course is an in depth study of human and biomedical genetics and the role of genetics in human health and disease. The course will acquaint students with contemporary knowledge of genetics in disease causation and susceptibility, the use of model organisms to inform human biology and contemporary topics in human genetics research like epigenetics, therapeutic cloning, gene therapy, role of genetics in response to drugs and predictive medicine. Credit cannot be given for both 441 and 541.

GN 451 Genome Science 3.  
Prerequisite: C- or better in GN 423.  
Complementation of modern genomics approaches with classical and molecular genetics; goals of major genome projects in animals, plants, humans, and microorganisms; genomic science opportunities at NCSU and in the Research Triangle; presentation and discussion of current literature; and preparation for careers in genomics-related fields.

GN 461 Advanced Bioinformatics 3.  
Prerequisite: GN 427 and ST 311 with grades of C- or better.  
This course provides in-depth experience in applying bioinformatic computing techniques to experimental data with a focus on the genetic and biological sciences. The course will provide experience in genome sequence analysis and assembly, extracting, manipulating and visualizing genetic and molecular data, analysis of macromolecular sequences, and generating and visualizing phylogenetic date. Laptop required.

GN 490 Genetics Colloquium 1.  
Prerequisite: GN 421.  
This course will involve critical study of research in genetics. Students will evaluate primary research publication on prepared topics assigned by instructor, with emphasis on review of recent and current research.

GN 492 External Learning Experience 1-6.  
Prerequisite: Sophomore standing.  
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

GN 493 Special Problems in Genetics 1-6.  
Prerequisite: Sophomore standing.  
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Arrangements must be initiated by student and approved by a faculty adviser and the departmental teaching coordinator.

GN 495 Special Topics in Genetics 1-3.  
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

GN 521 Molecular Genetics 3.  
Prerequisite: GN 311.  
Biological macromolecules and their interactions, DNA topology, eukaryotic genome structure, chromatin and chromosome structure, transcription and transcription regulation, epigenetics, RNAi and RNA processing, recombinant DNA technology, genetic transformation and cloning of plants and animals. Bacteria, viruses, plants, animals and fungi as genetic systems. Students cannot receive credit for both GN 421 and GN 521.

GN 541 Human and Biomedical Genetics 3.  
This course is an in depth study of human and biomedical genetics and the role of genetics in human health and disease. The course will acquaint students with contemporary knowledge of genetics in disease causation and susceptibility, the use of model organisms to inform human biology and contemporary topics in human genetics research like epigenetics, therapeutic cloning, gene therapy, role of genetics in response to drugs and predictive medicine. Credit cannot be given for both 441 and 541.

GN 685 Master's Supervised Teaching 1-3.  
Prerequisite: Master's student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

GN 690 Master's Examination 1-9.  
Prerequisite: Master's student.  
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

GN 693 Master's Supervised Research 1-9.  
Prerequisite: Master's Student.  
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's Student.  
Thesis Research.

GN 696 Summer Thesis Research 1.  
Prerequisite: Master's student.  
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.
Prerequisite: Master's Student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

GN 701 Molecular Genetics 3.
Prerequisite: GN 311.
A discussion of the structure and function of genetic material at a molecular level. Consideration of both prokaryotic and eukaryotic systems. The aim to describe genetics in terms of chemical principles.

GN 702 Cellular and Developmental Genetics 3.
Prerequisite: GN 701.
Regulation of genes involved in cellular function, differentiation and development in eukaryotes. Presentation of biological systems and model organisms used to study genetic control of cellular and developmental processes.

GN 703 Population and Quantitative Genetics 3.
Prerequisite: GN 311 and ST 512.

GN 708 Genetics of Animal Improvement 3.
Prerequisite: GN 311, ST 512.
Emphasis on the utilization of basic principles of population and quantitative genetics in animal improvement. Factors affecting genic and genotypic frequencies and methods of estimating genetic and nongenetic variance, heritabilities and breeding values. The roles of mating systems and selection procedures in producing superior genetic populations.

GN 709 Quantitative Genetics and Breeding 3.
Prerequisite: GN 311 and ST 512.
Quantitative and population genetic theory of breeding problems; partitioning of genetic variance, maternal effects, genotype by environment interaction and genetic correlation; selection indexes; design and analysis of selection experiments; marker-assisted selection.

GN 720 Molecular Biology In Plant Breeding 3.
Prerequisite: CS(GN, HS) 741, GN 701.
Theory and principles of molecular biology applied to plant breeding. Experimental approaches to induce genetic change, cytoplasmic recombination, haploid utilization and potentials of molecular techniques for solving breeding problems.

GN 721 Genetic Data Analysis 3.
Prerequisite: ST 430 and GN 311.

GN 725 Forest Genetics 3.
Prerequisite: GN 311.
Application of genetic principles to silviculture, management and wood utilization. Emphasis on variation in wild populations, the bases for selection of desirable qualities and fundamentals of controlled breeding.

GN 730 Fungal Genetics and Physiology 3.
Prerequisite: BCH 451, BO 775, GN 311 or PP 501.
Basic concepts of genetics and physiology of fungi, with emphasis on saprophytic and plant pathogenic mycelial fungi. Current literature on evolution, cell structure, growth and development, gene expression, metabolism, sexual and asexual reproduction and incompatibility systems. Laboratory exercises on mutant isolation, sexual and parasaexual analysis, genetic transformation, and RFLP and isozyme analysis.

GN 735 Functional Genomics 3.
Prerequisite: GN 701.
Methodology of experimental genomics; genome sequencing, gene expression arrays, genomic screens, proteomics. Aims and achievements of microbial, plant, animal, human genome projects. Applications of genomics including parasitology, breeding, functional genomics, evolutionary genetics. Interface with bioinformatics, data technology.

GN 740 Evolutionary Genetics 3.
Prerequisite: GN 703.
Genetic basis of evolution. Molecular evolution, molecular population genetics, evolutionary genetics of quantitative characters and the genetics of speciation. Critical reading of original research publications and student seminars.

GN 745 Quantitative Genetics In Plant Breeding 1.
Prerequisite: CS(GN, HS) 741, ST 512, course in quantitative genetics recommended.
Theory and principles of plant quantitative genetics. Experimental approaches of relationships between type and source of genetic variability, concepts of inbreeding, estimations of genetic variance and selection theory.

GN 746 Breeding Methods 2.
Prerequisite: CS (GN, HS) 741, ST 512.
Theory and principles of plant breeding methodology including population improvement, selection procedures, genotypic evaluation, cultivar development and breeding strategies.

GN 750 Developmental Genetics 3.
Prerequisite: GN 701, GN 702.
Action and regulation of genes and gene-products in development and differentiation. Examples from microorganisms, plants and animals. Emphasis on molecular and biochemical aspects of mechanisms controlling gene expression in eukaryotic cell differentiation.

GN 755 Population Genetics 3.
Prerequisite: GN 703.
Theoretical population genetics and its relationship to natural and experimental populations. Single locus and multilocus systems, history of a gene in a population, diffusion approximations, suitability of models to natural and experimental populations.

GN 756 Computational Molecular Evolution 3.
Prerequisite: GN 311 and ST 511.

GN 757 Statistics for Molecular Quantitative Genetics 3.
Prerequisite: ST 512 and GN 703 or ST 721.
Genetic mapping data. Linkage map reconstruction, quantitative genetic models. Statistical methods and computer programs for mapping quantitative trait loci and estimating genetic architecture of quantitative traits.
GN 758 Microbial Genetics & Genomics 3.
Prerequisite: BCH 451 or GN 311.
Structure and function in microbial genetics, with emphasis on microbial genome organization, stable maintenance and evolution. DNA mutation and repair pathways, transcriptional and translational regulation, DNA replication and recombination and characterization of recombinant DNA molecules. Applications of genetic and genomic analysis methods to microbial processes, including strain construction, genome manipulation, and enhancement of gene expression.

GN 761 Advanced Molecular Biology Of the Cell 3.
Prerequisite: BCH 703 and 705.
An advanced treatment involving integrated approaches to biological problems at the molecular level, encompassing biochemistry, cell biology and molecular genetics. Broad, multidisciplinary approaches to solving research problems in biology and the critical study of primary scientific literature, the development of a research proposal, oral presentations and class discussions.

Prerequisite: BCH 701 and 703.
An advanced treatment involving integrated approaches to biological problems at the molecular level, encompassing biochemistry, cell biology and molecular genetics. Broad, multidisciplinary approaches to solving research problems in biology and the critical study of primary scientific literature, the development of a research proposal, oral presentations and class discussions.

GN 801 Seminar 1.
Prerequisite: Graduate standing.
Informal group discussion of prepared topics assigned by instructor.

GN 810 Special Topics in Genetics 1-6.
Critical study of selected areas and special topics of current interest in genetics and related fields.

GN 820 Special Problems 1-6.
Prerequisite: Advanced Graduate standing.
Special topics designed for additional experience and research training.

GN 850 Professionalism and Ethics 1.
Prerequisite: Graduate standing.
The course is designed to give students background in professionalism, scientific ethics and responsible conduct of science. Topics include the role of the scientist in society, ethical theory, data acquisition and ownership, scientific misconduct, authorship, peer review, conflicts of interest and commitment, intellectual property, ethics of teaching and mentoring, ethical treatment of animal and human subjects, ethics of genetics research, job hunting and interviewing.

GN 860 Plant Breeding Laboratory 1.
Prerequisite: CS(GN,HS)741.
Visitation of plant breeding projects in the Deps. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

GN 861 Plant Breeding Laboratory 1.
Prerequisite: CS(GN,HS)741.
Visitation of plant breeding projects in the Deps. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

GN 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

GN 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

GN 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Geographic Information Systems (GIS)

GIS - Geographic Information Systems Courses

GIS 295 Special Topics in Geospatial Information Science 1-4.
Special Topics in Geospatial Information Science at the 200 level for offering courses on an experimental basis.

GIS 410 Introduction to Geographic Information Systems 3.
Overview of the operations and functions of computerized spatial display and map analysis processes (Geographic Information Systems), production of effective computer-generated maps and spatial displays, concepts for spatial modeling. Extensive independent learning and computer experiences including on-line virtual laboratory sessions. Credit will not be given for both GIS 410 and GIS 510.

GIS 505 Introduction to Geovisualization Technologies 2.
This course provides an overview of emerging methods and tools for the visual exploration, analysis, synthesis, and presentation of data that contains geographic information. Specific methods include the collection and representation of three-dimensional, remotely sensed, and gigapixel imagery. An introduction to the display of digital imagery and visualizations through interactive GIS and immersive virtual environment technology is also covered. This hands-on course provides an opportunity to interact with current technologies within the Center for Earth Observation's Digital Imagery Visualization Laboratory.
GIS 510 Introduction to Geographic Information Science
An overview of operations and functions of geographic information systems (GIS). Students develop expertise in spatial reasoning, problem definition, and skilled application of GIS software through lectures, readings, and extensive hands-on experiences. All course materials are delivered through the Internet. Credit will not be given for both GIS 510 and GIS 410.

GIS 512 Introduction to Environmental Remote Sensing
Principles and hands-on techniques for processing and analyzing remotely sensed data for natural resource applications. Topics include review of the electromagnetic spectrum, pre-processing (georectification, enhancements and transformations), processing (visual interpretation, indices, supervised and unsupervised classification) and post-processing (masking, change analysis and accuracy assessment) of digital image data. This course will provide students with fundamental concepts and skills needed to pursue further studies in digital processing of remotely sensed data.

GIS 515 Computer Cartography
Prerequisite: NR/PRT 462 or GIS 510.
Principles of cartographic design and how to apply them to produce high-quality geographic information system (GIS) based maps. Successful students will acquire an understanding of map design and experience applying it with GIS software. Students produce project maps in both print and web media.

GIS 520 Advanced Geospatial Analytics
Prerequisite: GIS 510 or PA 541 or SSC 440.
Focus is on advanced geospatial analysis and technologies. Students enhance geoprocessing skills and understanding of the analysis capabilities of geospatial technology, learn to integrate and analyze spatial data in various formats, and explore methods for displaying geographic data analysis results in decision support and modeling systems. All course materials are delivered through the Internet and student activity can be accomplished with student owned computers.

GIS 521 Surface Water Hydrology with GIS
Prerequisite: GIS 510 or PA 541 or SSC 440.
The application of geographic information systems (GIS) to surface water modeling including stream and watershed delineations, regulatory wetlands jurisdiction determinations, and flood mapping. In addition students will develop spatial computation methods to support hydrological analysis in land use planning, landscape management, and engineering assessments.

GIS 530 Principles of Geospatial Information Science
Prerequisite: GIS 510 or PA 541 or SSC 440.
This course is a study of theoretical underpinnings of geospatial information science including spatial data concepts, analysis, and modeling. Topics include projections, georeferencing, spatial representations, generalization, conflation, spatial topologies, and an introduction to remote sensing and image processing.

GIS 540 Geospatial Programming Fundamentals
Prerequisite: GIS 510 or PA 541 or SSC 440.
This course provides fundamental skills for geospatial programming. Topics include calling geographic processing tools, batch processing, performing file i/o in an external computing language and building, graphical user interfaces and displays. To support these tasks, students learn basic programming concepts, such as pseudocode, flow-control, code re-use, and debugging. In the final project, students streamline GIS work-flow and customize GIS user interfaces. Familiarity with GIS software is required, but no prior programming experience is expected.

GIS 550 Geospatial Data Structures and Web Services
Prerequisite: GIS 540.
This course examines the spatial database models and structures used in geospatial information science and technology as well as the design and implementation of web and related mobile computing geospatial tools and systems. Students develop, evaluate, and deploy multiple spatial data models and web services that include connections to external data sources and systems.

GIS 582 Geospatial Modeling and Analysis
The course explains digital representation and analysis of geospatial phenomena and provides foundations in methods and algorithms used in GIS analysis and modeling. Special focus is on terrain modeling, geomorphometry, watershed analysis and introductory GIS-based modeling of landscape process (water, sediment). This course includes analysis from lidar data, 3D visualization, and principles of open source GIS. Introductory level knowledge of GIS or surveying geomatics principles is required.

GIS 590 Geospatial Information Science Master’s Project
Prerequisite: GIS 550.
This is the culminating course for The Master of Geospatial Information Science and Technology degree. Students develop a professional portfolio highlighting the understanding and skills they have developed throughout the degree program. Featured in the portfolio will be a complex geospatial analysis project containing interoperable spatial and non-spatial data, web services, and customized user interfaces and work flows.

GIS 595 Special Topics in Geospatial Information Science
Special Topics in Geospatial Information Science.

GIS 601 Seminar in Geospatial Information Science
Seminar in Geospatial Information Science.

GIS 609 Geospatial Forum
The Geospatial Forum brings together researchers, educators, practitioners, and students of the geospatial sciences in an exciting, weekly series of lively presentations and facilitated discussions centered upon frontiers in geospatial analytics and geospatial solutions to complex challenges. Live discussions are recorded and made available online for students.

GIS 610 Special Topics in Geospatial Information Science
Special Topics in Geospatial Information Science.

GIS 630 Independent Study
Advanced topics not otherwise included in curriculum for advanced graduate students on a tutorial basis. Determination of credits and content by participating faculty in consultation with Director of Graduate Programs. Departmental consent required.

GIS 660 MGIST Professional Portfolio
Restriction: Graduate Student in the MGIST Program.
This course will focus on creating an effective digital portfolio, including content selection, description and reflection, and web site organization and design. The digital portfolio will present personal MGIST program accomplishments to demonstrate individual competences through knowledge, skills, and abilities of a geospatial science professional. Intended for students in their last semester in the MGIST Program.

Geography (GEO)
GEO - Geography Courses

GEO 200 Principles of Geography 3.
Basic ideas in the field of geography. The scope of geography as an academic field explored. Emphasis placed on mastery of geographic tools, e.g., maps, globes, and media materials and sources. Regional study of contemporary world.

GEO 220 Cultural Geography 3.
Investigates the world's past and present cultural diversity by studying spatial patterns of population, language, religion, material and non-material culture, technology and livelihoods, communities and settlements and political organization and interaction.

Global Knowledge (GK)

GK - GK Courses

GK 295 Global Knowledge Special Topics 1-3.
Special topics course offering for the general education Global Knowledge category.

Global Public Health (GPH)

GPH - Global Public Health Courses

GPH 201 Fundamentals of Global Public Health 3.
Introduction to Public Health, providing a population-based perspective on disease and injury causation and prevention. Environmental, social, behavioral, and biological determinants of health and disease. Access to health services from a global perspective. Selected tools of disease control and health promotion and problems related to health-care delivery to society as a whole and to vulnerable populations.

Prerequisite: C- or better in BIO 212 or BIO 250.
This Study Abroad course is designed to immerse students in current physiology and disease research, tropical medicine, and global health issues while providing students with an opportunity to gain hands-on experience in the field of global health. Students spend three weeks on campus exploring scientific, policy, cultural, and governmental influences on global health before traveling to a developing country to participate in medical service outreach for 2 weeks. Application to and acceptance into this Study Abroad course and payment for travel is required for course participation.

Graduate Economics (ECG)

ECG - Graduate Economics Courses

ECG 505 Applied Microeconomic Analysis 3.
Prerequisite: EC 301 and MA 121.

ECG 506 Applied Macroeconomic Analysis 3.
Prerequisite: EC 302 and MA 121.
Applied course in aggregate economics. Analysis of aggregate economic fluctuations and stabilization policy; inflation and disinflation; the Federal budget and international balance of trade; and economic growth. Capital markets, monetary and fiscal policy, banking system, foreign exchange markets and their effects on business conditions. Development of standard macroeconomic model in context of specific applications.

ECG 512 Law and Economics 3.
Prerequisite: EC(ARE) 301 or EC(ARE) 401.
Economic analysis of sources and effects of law, including common law, statutory law and regulation. Property rights and contracts, liability rules, crime and punishment, statutory enactment, bureaucratic behavior and institutional reform.

ECG 515 Environmental and Resource Policy 3.
Prerequisite: EC(ARE) 301 or 401.
Application of price theory and benefit-cost analysis to public decisions related to resources and environment. Emphasis on evaluation of water supply and recreation investments, water quality management alternatives, public-sector pricing, common property resources and optimum management of forest and energy resources.

ECG 528 Options and Derivatives Pricing 3.
Prerequisites: MA 341 and MA 405 and MA 421.
The course covers (i) structure and operation of derivative markets, (ii) valuation of derivatives, (iii) hedging of derivatives, and (iv) applications of derivatives in areas of risk management and financial engineering. Models and pricing techniques include Black-Scholes model, binomial trees, Monte-Carlo simulation. Specific topics include simple no-arbitrage pricing relations for futures/forward contracts; put-call parity relationship; delta, gamma, and vega hedging; implied volatility and statistical properties; dynamic hedging strategies; interest-rate risk, pricing of fixed-income product; credit risk, pricing of defaultable securities.

ECG 530 Topics in Labor Economics 3.
Prerequisites: ECG 505 and ECG 561.
This course covers topics in labor economics including labor supply, labor demand, human capital, household production, discrimination, and immigration. The course textbook will be supplemented with readings from academic research papers. Students will learn how empirical research evaluates the predictions of economic theory and the impact of public policy. Students will gain an understanding of how to read and critique empirical research by applying the theory and measurement techniques developed by economists.

ECG 537 Health Economics 3.
Prerequisite: EC(ARE) 401 or ECG 700.
Microeconomic analysis of public and private policy issues concerning health care financing and delivery in United States including: choice under conditions of asymmetric information; health insurance; performance of physician, hospital, long-term care and pharmaceutical markets.

ECG 540 Economic Development 3.
Prerequisite: EC(ARE) 301 or 401.
Examination of problems encountered in promoting regional and national economic development. Consideration given to structural changes required for raising standards of living. Some basic principles of economics applied to suggest ways of achieving development goals. Planning strategies, policies and external assistance.
Prerequisite: EC 301.  
This course covers the determinants of international trade, migration, and investment and their connection with economic growth. It also covers macro/monetary issues, including exchange rates, financial markets and monetary-fiscal policy in open economies.

ECG 561 Intermediate Econometrics 3.  
Prerequisite: ST 514.  
Formalization of economic hypotheses into testable relationships and application of appropriate statistical techniques. Major attention to procedures applicable for single equation stochastic models expressing microeconomic and macroeconomic relationship. Statistical considerations relevant in working with time series and cross sectional data in economic investigations. Survey of simultaneous equation models and the available estimation techniques.

ECG 562 Topics In Applied Econometrics 3.  
Prerequisite: ECG(ST) 561.  
Application of advanced econometric techniques to selected issues in economics. Practice in presenting econometric results in professional fashion, in written or oral form.

ECG 580 Writing in Economics 3.  
Corequisite: ECG 505 or ECG 700; ECG 506 or ECG 703; and ECG 561.  
Developing, writing and presenting economic analyses of empirical issues chosen by each student.

ECG 590 Special Economics Topics 1-6.  
Examination of current problems on a lecture-discussion basis. Course content varies as changing conditions require new approaches to deal with emerging problems.

ECG 630 Independent Study 1-3.

ECG 685 Master's Supervised Teaching 1-3.  
Prerequisite: Master's student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ECG 690 Master's Examination 1-9.  
Prerequisite: Master's student.  
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student.  
Thesis research.

ECG 696 Summer Thesis Research 1.  
Prerequisite: Master's student.  
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.  
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

ECG 700 Fundamentals of Microeconomics 3.  
Prerequisite: MA 131 and ECG(ARE)301.  

ECG 701 Microeconomics I 3.  
Prerequisite: ECG 700, MA 231.  

ECG 702 Microeconomics II 3.  
Prerequisite: ECG 701.  

ECG 703 Fundamentals of Macroeconomics 3.  
Prerequisite: EC(ARE) 301, EC 302, BUS(ST)350, MA 131.  
Fundamental topics in macroeconomics, including consumption, investment, government purchases, taxation, government debt, output supply, money and inflation, unemployment, elementary economic growth. Emphasis is on the microeconomic foundations of macroeconomics. Economic intuition is stressed.

ECG 704 Macroeconomics I 3.  
Prerequisite: ECG 700, ECG 703, MA 242.  
Rigorous examination of basic macroeconomic theory, including household choice of consumption demand and labor supply, capital accumulation and economic growth, government purchases, taxation, government debt, investment, consumption and investment under uncertainty, real business cycle models. Throughout the course, the connection between economic intuition and formal mathematical analysis is emphasized. The level of mathematical rigor is high.

ECG 705 Macroeconomics II 3.  
Prerequisite: ECG 704.  
Continuation of ECG 704. Topics include, but are not limited to, money demand and supply; money and growth; inflation; term structure of interest rates; money and fluctuations, including real and New Keynesian models; theories of unemployment; conduct of policy and problems of time consistency; asset pricing; introduction to open economy models.

ECG 706 Industrial Organization 3.  
Prerequisite: ECG 700.  
Survey of microeconomic literature on industrial organization: internal structure of the firm, number and sizes of firms in an industry, pricing and output behavior of firms. Public policy, including antitrust laws, patent and copyright laws, and government regulation of industry.

ECG 707 Topics In Industrial Organization 3.  
Prerequisite: ECG 700.  
Advanced study of selected topics such as oligopoly theory, empirical models of industry, principal-agent contracts, economic theories of firm organization, antitrust issues, economic theories of regulation and economics of property rights.
ECG 708 Advanced Microeconomic Theory 3.
Prerequisite: ECG 702.
Survey of literature on game theory focusing on applications to numerous areas of economics. Course will cover the classic literature on auctions, matching theory and non-cooperative game theory. Special focus on applying these theoretical results to practical problems of market design.

ECG 709 Behavioral and Experimental Economics 3.
Prerequisite: ECG 702.
Survey of literature on behavioral and experimental economics from a broad perspective, with coverage of numerous fields of economics, including both laboratory and field experiments. Methodology of experimental economics and design of laboratory and field experiments will be covered.

ECG 715 Environmental and Resource Economics 3.
Prerequisite: ECG 700.
Theoretical tools and empirical techniques necessary for understanding of resource and environmental economics, developed in both static and dynamic framework. Discussions of causes of environmental problems, possible policies and approaches to nonmarket valuation. Analysis of resource use over time using control theory for both renewable and exhaustible resources.

ECG 716 Topics In Environmental and Resource Economics 3.
Prerequisite: ECG 715.
Advanced study of selected topics in environmental and resource economics. Topics vary with interests of instructor and students.

ECG 730 Labor Economics 3.
Prerequisite: ECG 700 and one of the following: ECG(ST) 561, ST 422, ST 512, ST 708.
Application of microeconomic theory and econometric methods to labor market behavior in both static and dynamic contexts. Labor demand analysis, labor force participation, hours of work, household production, human capital, distribution of earnings, information and search, and mobility.

ECG 740 Economic Growth and Development II 3.
Prerequisite: ECG 701 and ECG 705, Corequisite: ECG 751.
Microeconomic issues of growth. Technology adoption and the distributional effects of technical change; the role of agriculture in economic development; land tenure and tenancy arrangements; the role of agrarian institutions in the development process; and poverty, inequality and economic growth in developing countries. Approximately equal time devoted to theory and evidence.

ECG 741 Agricultural Production and Supply 3.
Prerequisite: ECG 700.
Advanced study in logic of, and empirical inquiry into, producer behavior and choice among combinations of factors and kinds and qualities of output; aggregative consequences of individuals’ and firms’ decisions in terms of product supply and factor demand; factor markets and income distribution; and general interdependency among economic variables.

ECG 742 Consumption, Demand and Market Interdependency 3.
Prerequisite: ECG 700.
Analysis of behavior of individual households and of consumers in aggregate with respect to consumption of agricultural products; impact of these decisions on demand for agricultural resources, competition among agricultural regions and for markets, and interdependence between agriculture and other sectors of the economy.

ECG 748 Theory Of International Trade 3.
Prerequisite: ECG 700, 703.
Consideration of specialized body of economic theory dealing with international movement of goods, services, capital and payments. A theoretically oriented consideration of policy.

ECG 749 Monetary Aspects Of International Trade 3.
Prerequisite: ECG 703.
Macroeconomic problems of an open economy including balance of payments adjustment mechanism, alternative exchange rate systems, external effects of monetary and fiscal policy, optimum currency areas and international monetary reform.

ECG 750 Introduction to Econometric Methods 3.
Prerequisite: ST 421; Corequisite: ST 422.
Introduction to principles of estimation of linear regression models, such as ordinary least squares and generalized least squares. Extensions to time series and panel data. Consideration of endogeneity and instrumental variables estimation. Limited dependent variable and sample selection models. Attention to implementation of econometric methods using a statistical package and microeconomic and macroeconomic data sets.

ECG 751 Econometric Methods 3.
Prerequisite: ST 421, ST 422.
Introduction to important econometric methods of estimation such as Least Squares, Instrumental Variables, Maximum Likelihood, and Generalized Method of Moments and their application to the estimation of linear models for cross-sectional economic data. Discussion of important concepts in the asymptotic statistical analysis of vector process with application to the inference procedures based on the aforementioned estimation methods.

ECG 752 Time Series Econometrics 3.
Prerequisite: ECG(ST) 751.
The characteristics of macroeconomic and financial time series data. Discussion of stationarity and non-stationarity as they relate to economic time series. Linear models for stationary economic time series: autoregressive moving average (ARMA) models; vector autoregressive (VAR) models. Linear models for nonstationary data: deterministic and stochastic trends; cointegration. Methods for capturing volatility of financial time series such as autoregressive conditional heteroscedasticity (ARCH) models. Generalized Method of Moments estimation of nonlinear dynamic models.

ECG 753 Microeconometrics 3.
Prerequisite: ECG 751.
The characteristics of microeconomic data. Limited dependent variable models for cross-sectional microeconomic data: logit/probit models; tobit models; methods for accounting for sample selection; count data models; duration analysis; non-parametric methods. Panel data models: balanced and unbalanced panels; fixed and random effects; dynamic panel data models; limited dependent variables and panel data analysis.

ECG 765 Mathematical Methods For Economics 3.
Prerequisite: MA 231, introductory course in linear algebra.
Linear algebra and matrices, optimization with equality and inequality constraints, comparative statistics, differential and difference equations, intertemporal optimization. Economic applications to utility and profit maximization, national income determination, economic growth, business cycles.
Prerequisite: (MA 305 or MA 405) and MA 341 and EC 301 and EC 302 and (CSC 112 or 114) or equivalents.
Fundamental methods for formulating and solving economic models numerically will be developed. Emphasis on defining the mathematical structure of problems and practical computer methods for obtaining model solutions. Major topics include solution of systems of equations, complementarity relationships and optimization. Finite and infinite dimensional problems will be addressed, the latter through the use of finite dimensional approximation techniques. Particular emphasis placed on solving dynamic asset pricing, optimization and equilibrium problems. MS in Financial Mathematics Program required.

ECG 784 Advanced Macroeconomics 3.
Prerequisite: ECG 704.
Advanced study of macro-economics. Emphasis on business cycles and behavior of real variables. Real, incomplete information and disequilibrium theories of the business cycle; rational expectations; contract theory and indexation; investment; and effects of government expenditure, taxes and debt.

ECG 785 Monetary Economics 3.
Prerequisite: ECG 705.
Field course for students desiring a specialization in monetary economics or macroeconomics. Survey of current topics in monetary theory and policy.

ECG 790 Advanced Special Topics 1-6.

ECG 830 Independent Study 1-3.

ECG 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ECG 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Dissertation research.

ECG 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

**Graphic Communications (GC)**

**GC 120 Foundations of Graphics 3.**
Introductory course providing orientation to language of graphics for students majoring in any field. Designed to help develop ability to use CAD within the context of a concurrent design process to understand how everyday objects are designed, analyzed and created. Emphasis placed on decision-making processes involved with creating geometry and development of modeling strategies that incorporate intentions of designer.

**GC 250 Architectural Graphic Communications 3.**
Prerequisite: GC 120 or TDE 220.
Architectural Graphic Communications is an advanced graphic course designed to expand on the concepts covered in the introductory courses (GC 120, GC 210, GC 211). The emphasis is on strengthening architectural sketching and CAD drawing skills and showing how specific construction processes and materials selected for an architectural design affect commercial and residential production architectural drawings. Topics include perspective drawing, shadow projection, texturization, rendered plans, elevations and other related topics.

**GC 320 3D Spatial Relations 3.**
Prerequisite: GC 101 or GC 120 or GC/IE 210.
Analysis and solution of three-dimensional space problems utilizing graphic principles of orthogonal projection techniques. Application of studies of lines; surfaces; solids; surface intersections; surface development; vectors; and civil, mechanical, and geographical structures.

**GC 330 Basic Technical Animation 3.**
Prerequisite: GC 120 or TDE 220.
Create technical animations to communicate scientific and technical information to a variety of audiences and environments. Includes performing basic skills in image processing including cropping, transformations, color manipulation and color enhancement. Students will apply basic concepts of constructing 3-D objects, spaces, and environments. Create technical animations which apply environmental attributes including surface study, texture, color, lighting models, photo-realism, and raytracing.

**GC 340 Concepts of Website Development 3.**
An introduction to the essential elements of web site development for students in Technology Education and Graphic Communications. Content focuses on planning and executing web site for educational effectiveness, user interfaces, site testing, and maintenance. Course provides instruction in software appropriate for creating a website.

**GC 350 Applied CAD/D and Geometric Controls 3.**
Prerequisite: GC 120.

**GC 420 Visual Thinking 3.**
Prerequisite: Engineering or technical student.
Develop visual thinking skills through a series of exercises using various visual media. Integrates and stresses drawing and construction activities essential to visual thinking. Emphasis on direct observation (seeing), mental imagery and sketching that is based upon three-dimensional space. Develops students’ visual and drawing skills and provides for their application toward solving open-ended spatial problems. Intended for the scientific and technically oriented student.
GC 450 Advanced Graphics Usage with CAD 3.
Prerequisite: GC 350.
Advanced applications of 3-dimensional solid modeling tools in technical and engineering environments. Theory and application of manufacturing databases developed with 3-D modeling tools. Development and management of 3-D geometry using modeling software. Emphasis on application of 3-D modeling technology.

GC 496 Special Topics in Graphic Communications 1-4.
Topics of current interest in Graphic Design. Normally used to develop new courses.

GC 498 Independent Study in Graphic Communications 1-4.
Prerequisite: GC 120 or TDE 220.
Independent study in areas of current interests and needs of students in the field of Graphic Communications and the visual sciences. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Graphic Design (GD)

GD 201 Design, Context, and Experience 6.
Prerequisite: D 101, D 103, and D 103. Co-requisite: GD 210, GD 217.
Introduction to analysis and form-making in graphic design through investigations of design artifacts as components of larger and physical, social, cultural, and technological systems. Appropriate student-owned technology and software required. Graphic Design Majors Only, except with Department Head permission.

GD 202 Designing for Settings, People, and Use 6.
Prerequisite: GD 201, GD 210, GD 217; Corequisite: GD 310, GD 317.
Relationships among audience/user interpretive behavior, attributes of physical and cultural settings, and objects with attention to different perspectives on the role of the designer. Graphic Design Majors Only, except with Department Head permission.

Events, ideas, movements, designs and individuals that have historical significance and influence on contemporary graphic design and the graphic design profession. Concentration on graphic design of the last 100 years.

GD 210 Image and Technology 3.
Prerequisite: D 101, D 103, and D 105.
Introduction to representation and visualization strategies particular to the applied communication contexts of graphic design, including mapping, diagramming, and photography. Discussion of the role of various technologies in the construction of meaning. Digital camera and appropriate student-owned technology and software required. Graphic Design Majors only, except with Department Head permission.

GD 217 Typography and Technology 3.
Prerequisite: D 101, D 103, and D 105.
Introduction to typography with respect to four primary systems: reading, form, language, and technology. Appropriate student-owned technology and software required. Graphic Design Majors only, except with Department Head permission.

GD 292 Special Topics in Graphic Design 1-3.
Topics of current interest in Graphic Design. Normally used to develop new courses.

Investigations of branding, interaction, and service design in response to problems of complex systems and contexts. Graphic Design majors only, except with Department Head permission.

GD 303 Graphic Design Theory and Practice 3.
An examination of theories and critical perspectives shaping graphic practice. The course includes a discussion of contemporary design strategy in business and the role of visual communication in the information age.

GD 310 Visualization, Representation, and Display 3.
Prerequisite: GD 210.
Surveying, documenting, and interpreting sites and subjects; representing relationships among settings, people, and objects through image-making strategies, such as activity maps, interviews, panoramas, and visual essays. Graphic Design majors only, except with Department Head permission for other college of design majors.

GD 317 Typographic Language, Writing, and Reading 3.
Prerequisite: GD 217.
Continuation of typography and technology with greater emphasis on the individual reading experience, including page sequencing, grids, and the relationship between historical conventions and new interpretive demands on readers. Graphic Design majors only, except with Department Head permission.

GD 400 Advanced Graphic Design Studio 6.
Prerequisites: GD 301 and GD 203 and GD 303.
Topical and interdisciplinary studios addressing advanced visual communication problems. Graphic Design Majors only, except with Department Head permission.

GD 401 Capstone Graphic Design Studio 6.
Prerequisite: GD 400.
Capstone experience focused on the transition from school to work. Individual capstone project, collaborative work, and professional practice discussions. Graphic Design majors only, Seniors.

Prerequisite: GD 301.
Investigations of branding, interaction, and service design in response to problems of complex systems and contexts. Graphic Design majors only, except with Department Head permission.

GD 410 Online and Mobile Interaction Design Systems 3.
Prerequisite: GD 310.
Exploration of dynamic communication systems, including methods for visualizing user interaction, setting conditions for user experience, and managing collaborative work. Graphic Design majors only, except with Department Head permission for other College of Design majors.

GD 417 Information and Publishing Design Systems 3.
Prerequisite: GD 317.
Continuation of typographic language, writing, and reading with attention to advanced grid, form, and font systems in the design of multi-page documents, as well as issues of production and printing. Graphic Design majors only, except with Department Head permission.

Prerequisite: Junior standing in the major and Study Abroad Office approval.
Define visual communication design problems and develop design solutions in an international setting. Studio projects related to design, culture, and traditional and contemporary visual communication. Directed studies in history and culture, and in artifact making. Additional travel and trip costs are required beyond registration fees, as well as appropriate immunizations. Graphic Design majors and departmental approved Elective ("swing") Studio for all other College of Design Majors with Junior or Graduate Standing in Major.
GD 492 Special Topics in Graphic Design 1-3.
Prerequisite: Jr standing in Graphic Design major.
Topics of current interest in Graphic Design. Normally used to develop new courses. Graphic Design Majors, and department approved elective for all other college of Design Majors with Junior or Graduate standing in major.

GD 494 Internship in Graphic Design 3.
Prerequisite: Junior standing in Graphic Design and 3.0 GPA or better. Supervised field experience in graphic design offices and organizations. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

GD 495 Independent Study in Graphic Design 1-3.
Prerequisite: Junior standing in Graphic Design and 3.0 GPA or better. Special projects in graphic design developed under the direction of a faculty member on a tutorial basis. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

GD 501 Graduate Graphic Design Studio 9.
Corequisite: GD 571.
Student-defined graphic design projects in response to critical content framework presentation by GD 571 faculty. Center of framework on role of design objects as cognitive artifacts and extension, transformation or diminishment of human thought by their form and content. Interaction of potential audiences with designer-created artifacts. Graphic design majors only.

GD 502 Graduate Graphic Design Studio II 9.
Prerequisite: GD 501, Corequisite: GD 572.
Student-defined graphic design projects in response to critical content framework presentation by GD 572 faculty. Center of framework on role of design objects as cultural artifacts and their reflection on social diversity of both designers and audiences. Creation, reproduction, distribution and reception of messages in both designer-created artifacts and audience's response. Graphic design majors only.

GD 503 Graduate Graphic Design Studio III 9.
Prerequisite: GD 573, Corequisite: GD 671.
Student-defined graphic design projects in response to critical content framework presentation by GD 671 faculty. Center of framework on nature of new information environments. Shape and response of technologies to new cognitive and cultural relationships among audiences.

GD 510 Imaging for Graphic Design IV 3.
Prerequisite: GD 410, Design Majors.
Advanced problems in the visual design and structuring of information in interactive multimedia presentations. Topics include the design of interfaces, navigation, motion graphics, and websites as well as exploration of narrative and hypermedia approaches to the organization of content.

GD 517 Type IV 3.
Prerequisite: GD 417, Design Majors.
Advanced problems of typographic expression/communication in which typographic variables are used to alter, enhance, or reinforce verbal meaning. Historic precedent and experimentation with the conventions for typographic form are explored. The impact of the computer on changes in typographic aesthetics, including motion graphics, typeface design, and website design.

GD 571 Design As Cognitive Artifact 3.
Prerequisite: GD 503.
Analysis and critique of design objects as cognitive artifacts and extension, transformation or diminishment of human thought by their form and content. A critical examination of cognitive, linguistic and social science theories shaping graphic design. Non-majors by permission only.

GD 572 Design as Cultural Artifact 3.
Introduction to recent theories in various disciplines concerning a cultural understanding of graphic design. Theories of mass and popular culture, critiques of creativity and authorial intentionality, influences of interpretive criticism, theories of consumption and issues of cultural representation. Emphasis on adaptation of these theories to an understanding of the cultural significance of graphic design. Non-majors by permission only.

GD 573 New Information Environments 3.
Prerequisite: GD 503.
Changing role of graphic design in new information environments. Implications of new technology on social construction of meaning, impact of electronic media on culture and cognition, and differences in designing artifacts and designing experiences. Non-majors by permission only.

GD 580 Special Topics In Graphic Design History 1-6.
Prerequisite: GD 242.
Topics of current interest in interpretation, criticism, methodology and research, relating to graphic design history. Further specialized study in history of printing, typography, communication, image-making and information systems. Investigation of how we study artifacts, production and producers.

GD 581 Graphic Design Final Project Research 3.
Prerequisite: GD 502.
A seminar course to assist students in preparing foundation for final project to be conducted in GD 688 Final Project Studio.

GD 588 Final Project Studio In Graphic Design 6.
Prerequisite: GD 581.
Final project for graduate students supervised by members of their graduate advisory committees.

GD 592 Special Topics In Graphic Design 1-6.
Prerequisite: Graduate standing.
Topics of current interest to program/option offered by faculty in School. Subjects offered under this number normally used to test and develop new courses.

GD 610 Special Topics In Graphic Design 1-6.
Prerequisite: Permission of grad. advisor.
An investigation of special topics in graphic design of a particular interest to advanced students under direction of chair of graduate committee on a tutorial basis; credit and content vary with each student.

GD 630 Independent Study In Graphic Design 1-3.
Prerequisite: Graduate standing.
Special problems in various aspects of graphic design developed under the direction of a faculty member on a tutorial basis.

GD 676 Special Project In Graphic Design 1-3.
Prerequisite: Graduate standing.
Seminar on subjects of current interest in graphic design, presented by persons not part of regular faculty.

GD 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.
Programs and services that provide care for injuries and sudden illnesses until Emergency Medical Services (EMS) personnel arrive and take over. Optional fee and to provide care for injuries and sudden illnesses until Emergency Medical Services (EMS) personnel arrive and take over. Optional fee assessed for certification.

This course is designed to provide entry-level lifeguard participants with the knowledge and skills prevent, recognize and respond to emergencies. This course will provide NCSU students with the opportunity to learn and to provide care for injuries and sudden illnesses until Emergency Medical Services (EMS) personnel arrive and take over. Optional fee assessed for certification.

For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc. GD 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.

For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

This course will provide NCSU students with the opportunity to learn and to provide care for injuries and sudden illnesses until Emergency Medical Services (EMS) personnel arrive and take over. Optional fee assessed for certification.

HESA - Health Exercise Aquatics (HESA)

HESA - Health Exercise Studies Aquatic Courses

HESA 214 Beginning Swimming 1.
Swimming strokes and deep water skills for the non-swimmer to survive in the water.

HESA 215 Advanced Beginning Swimming 1.
Prerequisite: HESA 214 or equivalent skill.
Continuation of Basic Strokes acquired in Beginning Swimming, additional new strokes, and survival skills.

HESA 217 Survival Swimming 1.
Prerequisite: HESA 214 or equivalent skill.
This course will provide NCSU students with the opportunity to learn water survival skills and techniques that will enhance their chances of survival if stranded in the water. Skills include drownproofing, underwater swimming, survival swim strokes, jumping from a height, clothing inflation techniques, and swimming through a simulated oil/debris field. These survival skills and techniques will help promote physical fitness and a healthy lifestyle.

HESA 221 Intermediate Swimming 1.
Prerequisite: HESA 214 or equivalent skill.
This course is designed to provide instruction in five basic swim strokes: front crawl (freestyle), back crawl (backstroke), breaststroke, elementary backstroke and sidestroke. Additional emphasis will be placed on increased cardiovascular fitness along with skill development in treading water, underwater swims, turns and dives.

HESA 223 Lifeguard Training 2.
Prerequisite: PE 221 or equivalent skill.
This course is designed to provide entry-level lifeguard participants with the knowledge and skills prevent, recognize and respond to emergencies and to provide care for injuries and sudden illnesses until Emergency Medical Services (EMS) personnel arrive and take over. Optional fee assessed for certification.

HESA 226 Skin and Scuba Diving I 2.
Prerequisite: PE 221 or equivalent skill.
This course is designed for students with little or no experience, emphasizing safety and responsible skin and scuba diving techniques. Topics include the use and care of scuba equipment, diving skills, problem solving, emergency procedures, basic rescue techniques, direct and indirect effects of pressure, medical contradictions, oxygen enriched breathing, and gas management. Optional fee assessed for open-water training fieldtrip(s).

HESA 227 Skin & Scuba Diving II 2.
Prerequisite: HESA 226 or equivalent skills.
This course will build on the knowledge and skills learned in Skin & Scuba Diving I with emphasis on diver rescue techniques. Coursework will require a deeper understanding of dive planning, dive physiology, gas management, and diving first aid. Coursework will also require a higher skill level relating to propulsion techniques, navigation, equipment handling, buoyancy control, search & recovery techniques, and diving first aid than is required in Skin and Scuba Diving I. Optional fee assessed for open water training fieldtrip(s). Students must provide their own transportation for fieldtrip(s).

HESA 229 Scuba Leadership 2.
Prerequisite: HESA 227 or equivalent skill.
This course will provide NCSU students with the opportunity to build upon the skills learned in PE 227 and progress towards proficiency as a scuba diving leader. This course will help promote physical fitness and skill development in scuba diving, as well as an understanding of the knowledge and skills of scuba diving leadership. Participation in scuba leadership provides interested students with the opportunity to seek clarification as a scuba diving leader. Fee is assessed for required fieldtrip(s). Students must provide their own transportation for fieldtrip(s).

HESA 231 Scientific Diving 3.
Prerequisite: HESA 227 or equivalent skill.
This course covers the knowledge, skills, and diving experience necessary to plan and safely conduct scientific dives with regards to site selection, safety procedures, gas mix considerations, equipment requirements, data collection techniques, and dive team selection. These skills and techniques will help promote physical fitness and a healthy lifestyle. Successful completion of all phases of the course will qualify students for certification as a "scientific diver." This course meets American Academy of Underwater Sciences (AAUS) guidelines. Fee is assessed for required fieldtrip(s). Students must provide their own transportation for fieldtrip(s).

Health Exercise Studies Dance (HESD)

HESD - Health Exercise Studies Dance Courses

HESD 227 African Dance I 1.
Development of beginning level skill of East and West African dances, including history, culture, and context, emphasizing the central role that dance plays in African cultures.
HESD 230 Horton Dance Technique 1.
Development of beginning and intermediate-level skills in Horton dance technique, including alignment, vocabulary, performance, and history, with emphasis on strengthening the body for dance. Class format will include warm-up exercises, fortifications, studies, and traveling combinations. Course also includes the study of Lester Horton's influence on American modern dance, particularly in relation to integration in concert dance and the formation of Alvin Ailey American Dance Theater.

HESD 233 Clogging 1.
This beginning-level dance class covers the fundamentals of traditional and precision clogging. Emphasis is placed on basic foot skills, combinations, freestyle techniques, and Appalachian Mountain Figures. Clogging shoes are required for class.

HESD 234 Country Dance 1.
This course is the development of beginning-level skills in country dance including vocabulary, technique, history, and performance. A variety of fundamentals for leading and following, combinations, figures, and calls will be emphasized in American Heritage Dance, Texas Two-step, and Western Square Dance.

HESD 240 Social Dance 1.
Development of beginning-level skills in social dance, including vocabulary, technique, history, performance, with emphasis on leading and following in the : Cha-Cha, Foxtrot, Waltz, Rumba, and Shag.

HESD 241 Social Dance II 1.
Prerequisite: HESD 240 or equivalent skills.
This course will focus on training students to understand and perform more complex dances in an improvisational environment. Emphasis will be on learning advanced level dance steps and combinations that are more challenging or complex social dances not currently offered in the beginning level class. Dances taught will differ from semester to semester.

HESD 263 Tap Dance 1.
This beginning-level technique class covers basic tap dance skills in warm-up exercises, combinations, and compositions. Emphasis is placed on correct alignment in tap dance steps and the exploration of a variety of rhythms and patterns.

HESD 264 Ballet I 1.
Development of beginning-level technical skills in ballet, including vocabulary, technique, history, performance, alignment, function and access of turnout, with emphasis on safe and efficient body use.

HESD 265 Ballet II 1.
Further development of Ballet technique building on fundamental concepts and vocabulary introduced in Ballet I. Will include increased movement capabilities, rhythmic accuracy, alignment, performance, and access of turnout. A small fee may be required for dance concert attendance.

HESD 273 Jazz Dance I 1.
This beginning-level technique class covers basic jazz dance skills in warm-up exercises, combinations, and compositions. A variety of jazz styles are covered including one or more of the following: classical (Luigi/ Giordano), Broadway, contemporary, Afro-jazz, and others.

HESD 274 Modern Dance I 1.
Development of beginning-level technical skills and movement concepts in modern dance, including vocabulary, technique, history, performance, and alignment, with emphasis on safe and efficient body use. Class format will include structured exercises and improvisations. A small fee may be required for dance concert attendance.

HESD 275 Modern Dance II 1.
Prerequisite: HESD/DAN 274 (or permission of instructor).
Further development of modern dance technique, building on fundamental movement concepts and vocabulary introduced in Modern Dance I. Will include increased movement capabilities, rhythmic accuracy, and spatial relationships. A small fee may be required for dance concert attendance.

HESD 280 Jazz Dance II 1.
Prerequisite: HESD 273 or Instructor Permission.
Further development of jazz dance technique building on fundamental concepts and vocabulary introduced in Jazz Dance I. Will include increased movement capabilities, rhythmic accuracy, alignment, and performance. A small fee may be required for dance concert attendance.

Health Exercise Studies Emergency Medicine (HESE)

HESE - Health Exercise Studies Emergency Medicine Courses

HESD 300 Emergency Medical Technician 4.
Corequisite: HESE 351.
The EMT course includes a hybrid component and is the initial step in the certification process. Students will learn the foundations of prehospital care through fundamental knowledge of anatomy and physiology, pharmacology, airway management, and a systematic approach to the assessment and treatment of a variety of medical and traumatic processes. American Heart Association CPR certification is included in the course. Certification requires additional time and fees. Refer to online scheduled classes for current charges. Students responsible for providing own transportation to clinical.

HESD 301 Advanced Emergency Medical Technician 4.
Prerequisite: HESD 300 and HESE 351; Coreq: HESE 352.
This hybrid course leads to eligibility for optional certification as an advanced emergency medical technician (AEMT) with the North Carolina Office of EMS and/or the National Registry of Emergency Medical Technicians. Topics include advanced concepts in airway management, pharmacology, cardiac electrophysiology, vascular access, fluid and electrolyte disturbances, and an approach to differential-based assessment and management of acutely ill or injured patients. Certification will require additional time, fees, and internship liability insurance. Refer to online scheduled classes for current charge. Students will be responsible for own transportation to clinic.

HESD 304 Psychosocial Aspects of Aging in Emergency Care 2.
This course will focus on both the physiologic and psychosocial needs of the aging patient related to the provision of emergency care.

HESD 351 EMS Clinical I 1.
C: HESE/BIO 300.
Clinical Practicum I is the initial field internship offered as a co-requisite with HESE 300: Emergency Medical Technical (EMT). Students will complete 48 hours of field internship with a local EMS agency with an emphasis on basic life support skills. Certification requires additional time, liability insurance, and fees. Refer to online scheduled classes for current charges. Students responsible for providing own transportation to clinical rotations.
HESE 470 Medical Emergencies 3.
Prerequisite: HESE/BIO 301, HESE 352, BIO 183, and BIO 212.
This course will integrate the principles of epidemiology and pathophysiology to formulate a field impression and implement a comprehensive plan for a patient with a medical complaint. This course can only be taken for a letter grade.

HESE 480 Trauma Emergencies 3.
Prerequisite: HESE/BIO 301, HESE 352, BIO 183, and BIO 212.
This course will integrate the principles of epidemiology and pathophysiology to formulate a field impression and implement a comprehensive plan for a patient with a traumatic complaint. This course can only be taken for a letter grade.

Health Exercise Studies Fitness (HESF)

HESF - Health Exercise Studies Fitness Courses

HESF 100 Cross Training 2.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility, and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced aerobic activities as well as strength and endurance conditioning exercises.

HESF 101 Fitness and Wellness 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced running activities as well as strength and endurance conditioning exercises.

HESF 102 Fitness Walking 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced fitness walking techniques and strength conditioning exercises.

HESF 103 Water Aerobics 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues are also addressed. The components of fitness will be met through structured individually paced water aerobics classes that will take place in chest deep water. Muscular strength activities could take place in or out of water.

HESF 104 Swim Conditioning 1.
Prerequisite: PE 215 or equivalent skill.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. This course covers the mechanics of a variety of strokes, training methods, training principles, safety, with swim techniques that maximize fitness gains and minimize injuries.
HESF 105 Aerobics and Body Conditioning 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced aerobics classes. Muscular strength activities could take place in or out of the aerobics room.

HESF 106 Triathlon 1.
Prerequisite: PE 221 or equivalent skill.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced aerobics classes. Muscular strength activities could take place in or out of the aerobics room.

HESF 107 Run Conditioning 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced running activities on an indoor or outdoor track, and/or a cross-country route. Muscular strength activities will occur in a weight room or incorporated during running activities.

HESF 108 Water Step Aerobics 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced water step aerobics classes that will take place in chest deep water on an aquatic exercise step. Muscular strength activities could take place in our out of the water.

HESF 109 Step Aerobics 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced step aerobics classes. Muscular strength activities could take place in or out of the aerobics room.

HESF 110 Adapted Physical Education 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced aerobic, muscular strength and muscular endurance activities that meet the need of students with medical/physical limitations. For students with medical problems who are unable to take regular Physical Education classes. Repeatable up to two semesters.

HESF 111 Indoor Group Cycling 1.
This course is designed to teach and apply the principles of lifetime physical fitness, utilizing the five major components of cardio-respiratory endurance, muscular strength, muscular endurance, flexibility and body composition. A variety of health and wellness issues will be addressed. The components of fitness will be met through structured individually paced indoor group cycling classes. Muscular strength activities could take place in or out of the main classroom.

HESF 203 Pilates/Core Training 1.
This course will teach the fundamentals of Pilates which are to improve body awareness, increase breathing capacity and improve postural alignment through simultaneous stretching and strengthening movements. The goal of Pilates exercises is to achieve optimal functional fitness. The knowledge and training gained from Pilates will not only benefit an individual in their daily activities, but also improve their performance in any physical activity they choose to participate in.

HESF 237 Weight Training 1.
This is an introductory weight training course in which students will learn the principles of muscular development, as well as development of overall fitness. Free weights, machines, exercise equipment, and body weight exercises will be used to apply these principles. Various training systems and protocols will be introduced along with content of muscular physiological adaptations.

HESF 279 Yoga I 1.
This course will emphasize the physical practice of yoga at an introductory level. Coursework will introduce breathing exercises, relaxation techniques and a variety of yoga poses: standing, twisting, balancing, backward bending, and inversions. Students will develop the fitness skills required to perform these poses and maintain a safe yoga practice.

HESF 280 Yoga II 1.
This course will build upon material introduced in Yoga I by emphasizing the physical practice of yoga at an intermediate level. Coursework will require a deeper level of understanding of a variety of yoga poses, as well as mastery of the fitness skills required to perform these poses and maintain a safe yoga practice. Breathing techniques and the philosophy of Hatha Yoga will also be addressed.

HESF 282 Advanced Aerobics and Leadership 1.
This is an introductory course in which students will be provided content knowledge and practical experience in teaching and evaluating group exercise classes. A variety of group exercise forms will be covered in addition to the use of resistance equipment. Basic fitness and training principles will be discussed as applicable to advanced aerobics and leadership. The course content is equivalent to the ACE Group Fitness Instructor certification. Certification is not part of the course and would require separate testing pursued by the student.

Health Exercise Studies Outdoor (HESO)

HESO - Health Exercise Studies Outdoor Courses

HESO 253 Orienteering 1.
Navigating on foot from defined point to defined point, with use of map and compass in the shortest possible time.
HESO 255 Basic Canoeing 1.
Prerequisite: Basic swimming ability required.
Instruction and experience in flatwater canoe skills; emphasizing paddling skills, safety, flat and moving water travel techniques and proper equipment selection. Plan and participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to the online schedule of classes for the current charge.

HESO 257 Backpacking 1.
Prerequisite: Must pass basic fitness test.
Designed for students with little or no backpacking experience. Safe and environmentally-sound camping practices. Equipment/clothing, first aid and safety management agencies, land navigation, and trip planning. Plan and participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to online schedule of classes for the current charge.

HESO 258 Basic Rock Climbing 1.
Instruction and direct experience for the beginning rock climber. Emphasis on safe rope systems for belaying and basic movement on rock.

HESO 259 Intermediate Rock Climbing 1.
Prerequisite: HESO 258.
Development of intermediate rock climbing skills and practices including: climbing safety, belaying techniques, anchor systems, partner and self-rescue, rappelling and ascending techniques, minimal impact climbing, and climbing hazards. Participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to online schedule of classes for the current charge.

HESO 260 Introduction to Whitewater Canoeing 1.
Prerequisite: HESO 255, Intermediate swimming ability required.
Instruction and direct experience in fundamental whitewater canoeing skills. Basic paddling strokes and maneuvers for use on whitewater, river safety, basic river rescue, equipment selection and care, and environmental ethics. Participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to online schedule of classes for the current charge.

HESO 262 Whitewater Kayaking 1.
Prerequisite: Intermediate swimming ability.
This class is designed for students with little or no whitewater kayaking experience to develop basic kayaking skills and help them become proficient paddlers. Topics will include whitewater safety, equipment use and care, paddle strokes and river running techniques, basic rescue techniques, kayak navigation, basic hydrology, and trip planning. Participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to online schedule of classes for the current charge. Students must pass swim test to participate in course.

HESO 263 Sea Kayaking 1.
Prerequisite: Intermediate swimming ability required.
Instruction and experience in basic sea kayaking skills. Emphasis on paddling techniques, open water travel, navigation, minimal impact camping, safety, fitness, equipment selection and trip planning. Participate in one required weekend fieldtrip. Additional charge assessed for the fieldtrip. Refer to PackTracks for the current charge.

HESO 266 Mountaineering 1.
Prerequisite: HESO 258 or equivalent skills.
Participants are introduced to ropes and group initiative courses including a variety of adventure games, initiatives, love and high ropes course events. Safety, risk management issues and facilitation techniques are presented and discussed. Transportation is provided to and from the challenge course by the department. An additional charge is assessed for the course. Refer to the online schedule of classes for the current charge and field trip date(s).

HESO 268 Fly-Fishing 1.
Prerequisite: Basic swimming ability.
Instruction and experience in basic fly-fishing skills. Emphasis on casting techniques, tackle selection, habitat evaluation, minimal impact travel, safety, fitness, equipment selection and trip planning. Basic swimming ability and field trip required. Transportation provided by the Physical Education Department. Charge required with a non-refundable deposit.

HESO 269 Introduction to Challenge Course Programming 1.
Prerequisite: HESO 258 or equivalent skills.
Participants are introduced to challenge course by the department. An additional charge is assessed for the course. Refer to the online schedule of classes for the current charge.

HESO 281 Introduction to Challenge Course Programming.
Prerequisite: HESO 258 or equivalent skills.
Participants are introduced to ropes and group initiative courses including a variety of adventure games, initiatives, love and high ropes course events. Safety, risk management issues and facilitation techniques are presented and discussed. Transportation is provided to and from the challenge course by the department. An additional charge is assessed for the course. Refer to the online schedule of classes for the current charge.

HESO 283 Mountaineering 1.
Prerequisite: HESO 258, HESO 257.
Instruction and experience in alpine climbing skills emphasizing snow and ice travel, safety, land navigation, winter hazard evaluation, minimal impact camping skills, and equipment selection. Three full-day classroom sessions before the trip required. Plan and participate in a ten-day field trip over winter break. Additional charge assessed for the field trip with a non-refundable deposit. Refer to the online schedule of classes for the current charge. Final grades will not post until the second week of January. In the interim, a grade of LA will be given. December-graduating seniors should be aware this will delay graduation clearance and posting of degrees.

HESO 284 Sea Kayaking 1.
Prerequisite: Intermediate swimming ability.
Instruction and experience in basic sea kayaking skills. Emphasis on paddling techniques, open water travel, navigation, minimal impact camping, safety, fitness, equipment selection and trip planning. Plan and participate in one required field trip. Additional charge assessed for the field trip with a non-refundable deposit. Refer to the online schedule of classes for the current charge.

Health Exercise Studies Racquet (HESR)

HESR - Health Exercise Studies Racquet Courses

HESR 242 Badminton 1.
This is a beginning badminton course in which students will develop the basic skills necessary to play the game of badminton. Technical skills include the overhead and underhand clears, the short and long serves, drop shots and the smash. Instruction will include an emphasis on the fundamental strategies and rules used in both singles and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of badminton.

HESR 248 Squash 1.
This an introductory squash course in which students will develop the basic skills necessary to play the game of squash. Skills that will be covered include the serve, forehand and backhand drives, volleys, lob and boast shots. Fundamental strategies and rules will be covered for singles, cutthroat, and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of squash. Approved protective eyewear must be provided by the student.
HESS 249 Tennis I 1.
This is a beginning tennis course in which students will develop the basic skills necessary to play the game of tennis. Technical skills include forehand and backhand ground strokes, volleys, serves and proper footwork. Students will also learn the fundamental rules, basic strategies, and court positioning for singles and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of tennis.

HESS 250 Tennis II 1.
Prerequisite: HESS 249.
This course will review some of the basic tennis skills introduced in the PE 249 Tennis I course. Additionally, this course will introduce more advanced techniques in stroke production and skill development such as the topspin and slice serves, approach shots, half-volleys, and drop shots. Students will analyze some of the various styles of play used in the game of tennis and perform drills as well as match play situations that will improve performance based on offensive and defensive tactics in both singles and doubles.

HESS 256 Racquetball 1.
This is a beginning racquetball course in which the students will develop the basic skills to play the game of racquetball. Technical skills include forehand and backhand groundstrokes, ceiling balls, serves and proper footwork. Students will also learn the fundamental rules, basic strategies, and court positioning for singles, cutthroat and doubles play. Basic fitness and training principles will be discussed as applicable to the sport of racquetball. Approved protective eyewear must be provided by the student.

HESS - Health Exercise Studies Specialty Courses

HESS 219 Gymnastics 1.
Develop basic gymnastics skills on vault, bars, beam, floor, and trampoline. 1) To assist the students in safely learning progressions on each of these events for skill development. 2) To acquire the fitness requirements associated with learning these skills. 3) To identify the hazards and risks associated with gymnastics and 4) To identify basic skills and terminology associated with the sport.

HESS 235 Beginning Karate 1.
Introduction to traditional Japanese karate: kihon (basic punching, striking, blocking, and kicking techniques); kata (formal drills); yakusoku kumite (pre-arranged sparring); and demonstration of ji-yu-kumite (controlled free sparring). Karate uniform required.

HESS 239 Self Defense 1.
Basic self defense and techniques. Skills covered include strikes, blocks, and escapes; plus psychology of general and sexual assault. Physical contact will occur between students and with the instructor as well.

HESS 243 Bowling 1.
This is a beginning bowling course in which the students will develop the basic skills necessary to play and enjoy the game of bowling. Technical skills include ball rotation and delivery along with proper footwork. Students will also learn the fundamental rules, basic strategies for throwing a strike ball, general theory for converting spares, and scoring along with bowling etiquette, terminology, rules, and safety precautions. Basic fitness and training principles will be discussed as applicable to the sport of bowling. Additional fee assessed.

HESS 245 Golf 1.
This course will provide golf instruction at an introductory level. Coursework will introduce full swing fundamentals, chipping, pitching and putting fundamentals, rules, and etiquette on the golf course, and history of the game. Students will develop and appreciation for the game of golf through practice, play, and time of the golf course. There is a required fee for class meetings at the Lonnie Poole Golf Course Range. Check the online scheduling for current charge. The student must provide their own transportation to the golf course.

HESS 246 Handball 1.
This course will provide handball instruction at the beginning level in which students will develop the basic skills necessary to play the game of handball. Technical skills include serves, overhead, sidearm, and underhand strokes, ceiling shot, lob, three-wall shot, kill shots and passing shots. Instruction will include an emphasis on the fundamental strategies and rules used in singles, doubles, and cutthroat play. Basic fitness and training principles will be discussed as applicable to the game of handball. Students are required to purchase handball gloves and protective eyewear.

HESS 251 Target Archery 1.
Shooting fundamentals, safety, selection, and care of equipment.

HESS 252 Skiing/Snowboarding 1.
Instruction and experience in the fundamentals of skiing or snowboarding. Emphasis on safety, controlled turns and stops, equipment selection, and pre-season preparation. Slope instruction held at a selected site during winter break. Additional charge assessed for trip with a non-refundable deposit. Refer to the online schedule of classes for program format options, current charges and trip dates. Students are responsible for providing their own transportation. Final grades will not post until the second week of January. In the interim, a grade of LA will be given. December graduating seniors should be aware this will delay graduation clearance and posting of degrees.

HESS 254 Beginning Equitation 1.
This course is designed to apply knowledge of the fundamentals of health-related fitness toward developing, maintaining and sustaining active and healthy lifestyle through equestrian sports. Basic techniques, theories and performance in equitation including skills at the walk, trot and over ground poles will be taught. Care of the horse, grooming, tacking, and safety around horses will be addressed. Students will travel off campus once a week. Refer to the online schedule of classes for the current charge. Students must provide their own transportation and paddock boots. Students must meet the weight guidelines of the North American Horseman's Association.

HESS 252 Intermediate Equitation 1.
Prerequisite: Beginning Equitation.
This course is designed to apply knowledge of the fundamentals of health related fitness toward developing, maintaining, and sustaining active and healthy lifestyle through equestrian sports. Intermediate techniques, theories and performance in equitation including skills at walk, trot, canter over ground poles and small cross bars will be taught. Care of the horse, tack and safety around horses will be assessed. Students will travel off campus once a week. Students must meet the weight restriction of the North American Horseman's Association. Refer to the online schedule of classes for the current fee. Students must provide their own transportation to the stable, paddock boots, and riding pants.

HESS 295 Special Topics in Physical Education 1-3.
Examination of selected topics in health, fitness, outdoor leadership, physical education, and sport.
HESS 296 Independent Study in Physical Education 1-3.
Independent study in Physical Education will vary according to the specialized topic of interest. Credit and content determined by instructor. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

Health Exercise Studies Team (HEST)

HEST - Health Exercise Studies Team Courses

HEST 216 Soccer 1.
Soccer with emphasis on skills development, playing strategies, and rules of the game.

HEST 261 Basketball 1.
Offensive and defensive skills development and systems of team work. Coverage of strategies, history and rules of the sport.

HEST 265 Slow Pitch Softball 1.
Develop basic skills, rules and strategies for playing slow pitch softball. This course provides an ideal setting for beginning through intermediate players to acquire or enhance skill sets and obtain knowledge to participate recreationally in a slow pitch softball game or league.

HEST 266 Ultimate Frisbee 1.
Emphasis on skill development, aerobic fitness and spirit of competition. Includes flight dynamics, various throwing and catching techniques, offensive skills, defensive skills, equipment, strategies, and rules of the game.

HEST 267 Flag Football 1.
An introduction to the skills, history, rules and strategy of flag football.

HEST 269 Volleyball I 1.
This course is designed to teach and apply the basic volleyball fundamentals of setting, passing, serving, spiking, court movement, and game strategy.

HEST 270 Volleyball II 1.
Prerequisite: HEST 269.
This course is designed to go beyond the basic volleyball skills. Emphasis will be placed on floater, top spin, and jump serves, forearm passing, setting, back setting, strong side and weak side attacking, blocking and advance serve reception techniques.

Health and Exercise Studies Minor (HESM)

HESM - Health and Exercise Studies Minor Courses

HESM 201 Coaching Baseball/Softball 2.
Theories, techniques, and strategies of coaching baseball/softball.

HESM 202 Coaching Basketball 2.
Theories, techniques, and strategies of coaching basketball.

HESM 203 Coaching Football 2.
Theories, techniques, and strategies of coaching football.

HESM 204 Coaching Golf 2.
Theories, techniques, and strategies of coaching golf.

HESM 205 Coaching Soccer 2.
Theories, techniques, and strategies of coaching soccer.

HESM 206 Coaching Swimming and Diving 2.
Theories, techniques and strategies of coaching swimming and diving.

HESM 207 Coaching Tennis 2.
Theories, techniques, and strategies of coaching tennis.

HESM 208 Coaching Track & Field/Cross-Country 2.
Theories, techniques, and strategies of coaching track and field and cross-country.

HESM 209 Coaching Volleyball 2.
Theories, techniques, and strategies of coaching volleyball.

HESM 211 Strength Training and Conditioning 2.
Knowledge and skills necessary for designing and implementing strength and conditioning programs. This course does not constitute credit toward meeting the minimum university Physical Education requirements.

HESM 212 Alcohol, Drugs and Tobacco 2.
Theories of drug use, pharmacology, tolerance, dependence, nicotine, alcohol usage, alcoholism, sedative-hypnotics, narcotics, amphetaimes, cocaine, marijuana, hallucinogens, steroids and treatment. This course does not constitute credit toward meeting the Physical Education GER requirement.

HESM 213 Human Sexuality 2.
Physiological and psychosocial aspects of human sexuality. Emphasis placed on health-related topics of birth control, pregnancy, childbirth, abortion and sexually-transmitted diseases. Concepts of gender acquisition, sexual values, and sexual morality discussed as related to the promotion of healthy lifestyles within contemporary American culture.

HESM 214 Introduction to Adventure Education 3.
History and philosophy, social psychology of adventure, theories of adventure, benefits, risk-taking behavior, current trends and issues, research and evaluation, and model programs. Field trip required. Students are responsible for their own transportation for field trip.

Principles and practices of leadership in adventure education and recreation programs: group management, trip planning, staffing, group dynamics, health and safety issues, risk management and other relevant topics.

HESM 216 Backcountry Instruction Methodology 2.
Techniques for teaching outdoor skills and activities are covered. Emphasis is placed on trip planning, presentations, and skills instruction for outdoor educators. Students will make numerous outdoor activity skills presentations. Students will also evaluate and provide feedback for classmates. Students must participate in two required weekend field trips. Additional charge assessed for the field trips. Refer to the online schedule of classes for the current charge and dates.

HESM 275 Behavior Change in Wellness 2.
Restricted to: Wood Wellness Village Students only.
This course introduces students to the eight dimensions of wellness (social, physical, emotional, occupational, intellectual, environmental, spiritual, financial) and features a series of lectures, in-class activities and discussions, course readings, and personal wellness profile, curricular wellness activities, and a behavior change project. Wood Wellness Village first time residents; This course does not fulfill the health and exercise studies GEP requirement.
HESM 280 Responding to Emergencies 2.
This course introduces the basics of first aid treatment for the lay rescuer. Topics include CPR, AED use, choking and bleeding emergencies, and other basic first aid procedures. This course does not satisfy the Physical Education GEP requirement.

HESM 281 Emergency Medical Responder 3.
This course introduces the knowledge and skills necessary to respond appropriately in an emergency at the Emergency Medical Responder provider level. Topics include: introduction to the EMS system, roles and responsibilities, medical/legal considerations, respiratory emergencies and ventilation devices, cardiac emergencies and cardio pulmonary resuscitation (CPR), automated external defibrillation (AED), patient assessment, medical emergencies, trauma management, special patients, and emergency medical service (EMS) operations. This course does not satisfy the Physical Education GEP requirement.

HESM 284 Women’s Health Issues 2.
This course will review health and wellness issues affecting women through their life span. It will explore medical concerns and prevention as well as social health issues that disproportionately affect women in contemporary society. Discussions of current critical topics in women’s health will also take place. Minor courses.

HESM 285 Personal Health 2.
Behavior change, wellness, stress management, cardiovascular diseases, alcohol and tobacco use, cancer, infectious diseases, arthritis, human sexual response, sexual assault, contraception, and sexually transmitted diseases. This course does not constitute credit toward meeting the Physical Education GER requirement.

HESM 286 Nutrition, Exercise and Weight Control 2.
A nutrition, exercise and weight management program emphasizing the basics of proper nutrition and exercise. Emphasis on lifestyle changes and their relationship to appropriate weight management. Medical request.

HESM 287 Stress Management 2.
Impact of stress upon the psychological and physiological function of the body. Exploration and interaction with stress management techniques. This course does not constitute credit toward meeting the Physical Education GER requirement.

HESM 300 Practicum in Health 1.
Prerequisite: HESM 285, HESM 375, HESM 377, and 6 hours of electives from the Health Minor.
This course focuses on applying program development, management, evaluation, and educational strategies and techniques within a health-related setting. Students are required to purchase internship liability insurance to participate in the practicum. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

HESM 301 Coaching Practicum 1.
Prerequisite: Requires departmental consent, First Aid, and CPR Certification or Equivalent.
A 30-hour practical coaching experience in a middle school or high school setting. Specific placement will depend upon the various playing sessions for the sports involved. Students are required to purchase internship liability insurance to participate in the practicum. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

HESM 302 Practicum Experience in Outdoor Programs 1.
Prerequisite: HESM 214, HESM 215, HESM 216, HESM 280 or equivalent.
The practicum experience provides a short-term, supervised opportunity for students to participate in leading an outdoor activity course or program. The practicum is the integration of academic preparation with its application in a field setting. The student may be assigned to a Department of Physical Education outdoor activity course, program or to an approved non-University program in order to meet this requirement. The practicum student must be directly involved in the program for a minimum of 30 hours. Students are required to purchase internship liability insurance to participate in the practicum. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

HESM 303 Sports Science Practicum 1.
Prerequisite: Completed coursework in Sports Science Minor.
A 30-hour practical sports science specialist experience in a fitness specific setting within the triangle area. Course does not constitute credit toward meeting the physical education requirement. Students are required to purchase internship liability insurance to participate in the practicum. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

HESM 304 Dance Practicum 1.
A 30-hour practical experience in the dance field. Assigned internships could include dance teaching, performing, choreographing, research, or other dance-related work dependent upon the student's experiences and interests. Specific placement will be determined by the student and the instructor. Students may be required to purchase internship liability insurance to participate in the practicum. Contact university insurance & risk management for details on acquiring the insurance and the current charge.

HESM 320 Movement Improvisation 1.
Conceptually guided, spontaneous movement generation and invention reached through individual and group experiences.

HESM 322 Dance and Society 3.
Dance and Society examines dance as an artistic, religious, cultural, and social form, including historic and aesthetic influences, basic dance elements, and relationship to other arts. This course incorporates multiple modalities of dance knowledge - lectures, films, demonstrations, and practical dance experience. A small fee may be required for concert attendance.

HESM 324 Concert Dance History 3.
An overview of the development of Western theatrical dance. This course introduces the major figures and movement theories of the 19th & 20th Centuries with particular emphasis on major stylistic trends and cultural influences. Readings, discussions, lectures, and films/videos will introduce selected choreographers and the concerns that inform their work. Additional readings in dance philosophy and aesthetics will address ideas such as form, expression, audience expectations, and performance conventions. A small fee may be required for concert attendance.

HESM 326 Current Trends in Dance 3.
Critical and contextual examination of current trends in dance. While specific readings and video resources will vary by semester as the field of dance continues to change, major course topics will include at least three of the following: the role of dance supporters and presenters, media influences, non-concert and site-specific dance, current movement trends, political significance, and international concerns.
HESM 328 Dance Composition II.
Prerequisite: DAN 272.
This course builds on skills and concepts learned in Dance Composition I. Various approaches to choreography will be discussed and explored. A student-choreographed group work will be created and performed. A small fee may be required for dance concert attendance.

HESM 330 Introduction to Laban Movement Analysis and Bartenieff Fundamentals.
An introduction to Laban Movement Analysis (LMA) and Bartenieff Fundamentals (BF) through movement integration, observation, notation, analysis, and application. LMA is a method and language for describing, visualizing, interpreting, and documenting all varieties of human movement. It consists of the study of four major components: Body, Effort, Shape and Space, the relationships between them, and ways of noting them. BF consists of a set of concepts, principles and exercises developed by Irmgard Bartenieff in applying Laban's movement theory to the physical/kinesiological functioning of the human body. LMA/BF is used by dancers, actors, musicians, and dance therapists, among others.

HESM 335 Prevention of Sexual Assault and Violence.
This course focuses on methods and techniques for delivering health-related content to diverse populations. Cooperative learning, critical thinking, peer educator training, and decision-making will be applied to various health dimensions.

HESM 375 Health Planning and Programming.
Prerequisite: HESM 285 Personal Health.
This course is designed to assist students in developing a foundation in health programming. Students will learn the necessary skills to develop, implement, and evaluate health education programs.

HESM 377 Methods of Health Promotion.
This course focuses on methods and techniques for delivering health-related content to diverse populations. Cooperative learning, critical thinking, peer educator training, and decision-making will be applied to various health dimensions.

HESM 381 Athletic Training.
Prerequisite: HESM 280 or HESM 281 or or CPR/First aid Certification.

HESM 467 Motor Learning and Sport Performance.
This course will introduce the concepts, principles, and theories dealing with the performance of motor skills as applied in the areas of sport performance and physical activity. Topics will discuss how skilled movements are learned, maintained, and enhanced as well as explore some of the basic physiological, bio-mechanical, and cognitive influences which affect the quality of skilled performance. This course is primarily designed to benefit sport coaches, physical educators, and fitness instructors.

HESM 477 Coaching Concepts.
Practical and theoretical concepts essential to the preparation of coaches. This course does not constitute credit toward meeting Physical Education requirements.

HESM 478 Exercise Physiology and Sports Science.
Basic principles of human anatomy, physiology, and biomechanics and their relationship to athletic coaching.

HESM 479 Sport Management.
Planning, organizing, leading, and evaluating within a sport context; fundamentals of accounting, budgeting, economics, marketing, strategic planning, ethics, and their use in sport settings; techniques of personnel, facility, and sporting event management.

HESM 480 Principles of Exercise Programming.
Prerequisite: HESM 478.
Fundamentals and scientific principles necessary to plan, design, implement, and evaluate individual exercise programs.

History (HI)

HI - History Courses

HI 205 Western Civilization Since 1400.
A survey of Western Civilization from the Renaissance to the present.

HI 207 Ancient Mediterranean World.
The ancient cultures of the Middle East, Greece and Rome, including Mesopotamian, Egyptian, Hebrew, Phoenician, Greek and Roman societies and cultures.

HI 208 The Middle Ages.
Medieval civilization as it emerged from the declining Roman Empire through its apogee in the 13th century. The transition from the classical to the medieval world, the impact of the Germanic influx, the Islamic influence, the Crusades, and the political, economic, and social institutions of the High Middle Ages.

HI 209 From Renaissance to Revolution: The Origins of Modern Europe.
Exploration of the political, economic, social, and cultural history of Western Europe during an intense and exciting period of transition from a medieval to a modern world. Topics to be discussed include Renaissance art and philosophy; the printing revolution and the French Revolution; climate change and economic dislocation; witchcraze; religious reforms and religious wars; commercialization; navigation; empire; slavery; the new science; and new ideas about democracy, equality, and modernity.

HI 210 Modern Europe 1815-Present.
Survey of the history of European societies and political systems from 1815 to the present.

HI 214 History and Archaeology of Ancient Latin America.
Exploration of ancient Latin American civilizations and early Europeans in the region through archaeological and historical analysis. Major themes include migrations of people into the Western hemisphere, the rise and decline of states and empires such as the Maya, Aztecs, Moche, and Incas, inter-regional trade, development of writing and communication systems, religious ideology, social and political infrastructure and mechanisms of control. Unique cultural forms discussed include mummies, pyramids, military techniques, political propaganda, and agricultural innovation. Contemporary issues addressed include media representations of the past, indigenous rights, and looting and destruction of cultural property.

HI 215 Latin America to 1826.
Exploration of the pre-Hispanic indigenous roots and the colonial period in Latin America. Major themes include the origins and development of social, political, economic and religious institutions from pre-conquest times to the achievement of independence. Topics include ancient American cultures, conquest and settlement by Spain and Portugal, colonial rule in theory and practice, religious life and structures, the colonial economy and labor, and independence movements.
HI 216 Latin America Since 1826 3.
Analysis of the last two centuries of social, political, economic, and intellectual life in Latin America and the Caribbean. Course readings include primary sources, declassified CIA documents, and Latin American literature. Course themes include social and political conflicts, changing gender relations, human rights abuses, the impact of the US and global economic forces, and the impact of the growing Latino population in the US.

HI 221 British History to 1688 3.
History of the British peoples from earliest times to the Glorious Revolution. Social, political, constitutional developments; relationship between history and literature; synthesis of British cultures.

HI 222 History of British Cultures and Societies From 1688 3.
British people from Glorious Revolution to the present. Social, political, constitutional development; history and literature; growth and decline of British empire; spread of British culture.

HI 232 The World from 1200 to 1750 3.
The making of the modern world through interregional conquest and commerce from 1200 to 1750. Focus on the growing global circulation of peoples, pathogens, goods, and ideas.

HI 233 The World Since 1750 3.
This course surveys the making of the world from 1750 to the present. Topics include: the Industrial Revolution, the development of the Nation-States, the rise of European, American and Japanese Empires, WWI, inter-war reconfigurations of colonial empires, anti-colonial nationalist movements, the Great Depression, the Cold War, struggles for political and economic independence among newly independent nations, the US-dominated neo-liberal order from the 1980s to the present, and contemporary global conflicts over ethnicity, religion, resources, disease, and the environment.

HI 240 Introduction to Visual Culture 3.
Prerequisite: Sophomore standing.
Introduction to the role of visual cultural production in the nineteenth and twentieth centuries in expressing and shaping both individual and collective identities. Case studies of imperialism, gender, and war draw from different regional histories and utilize a variety of visual genres - such as photography, popular posters, painting, advertising, and film stills - to study how visual culture can be used as evidence to understand the past, using the approaches of the disciplines of History and Art History.

HI 251 Early American History 3.
Themes in early American history: colonial clash and mix of culture; generation of an American consciousness; federalism and democracy in national politics; expansion and immigration; racial and sectional division.

HI 252 American History II 3.
Themes in post-Civil War American history: impact of war on American foreign and domestic policy; the repercussions of industrialization and economic modernization; continuity and change in American institutions and values; problem solving in pluralistic society. Credit is not allowed for both HI 252 and HI 254.

HI 254 Modern American History 3.
X: Credit not allowed for both HI 254 and HI 252.
Major themes in modern American history with an emphasis on diversity in the United States; focuses on aspects of race/ethnicity, gender, class, sexual orientation, disability, religious and/or age identities as it considers the impacts of industrialization and economic modernization; impact of war on American domestic and foreign policy; continuity and change in American institutions and values; problem solving in a pluralistic society. Credit is not allowed for both HI 254 and HI 252.

HI 263 Asian Civilizations to 1800 3.
The history of China, India, Japan, and Southeast Asia from 500 to 1800. The making of the Asian region through the rise and fall of five great empires: the Tang, the Mongol, the Mughal, the Qing, and the British empires.

HI 264 Modern Asia: 1800 to Present 3.
Introductory survey of 19th and 20th century Asia, with attention to Japan, Southeast Asia, India and China. Emphasis on cultural and political crises of the 19th century and revolutionary transformations of the 20th century.

HI 270 Modern Middle East 3.
Social and political change in the Middle East in the nineteenth and twentieth centuries. Decline of the Ottoman empire, the rise of nationalism, the waxing and waning of European imperialism in the region, and the creation of modern states and societies and their ideological and economic underpinnings.

HI 275 Introduction to History of South and East Africa 3.
The African kingdoms (Lunda, Buganda, and Zulu); the European encroachment; the origins of colonialism and the character of colonial societies and economies, South African apartheid; African protest, nationalism and independence.

HI 276 Introduction to History of West Africa 3.
The history of Western Africa. Forest civilizations and the slave trade, trade and the expansion of Islam, colonialism in West Africa; African nationalism and the achievement of independence; and postcolonial West Africa.

HI 298 Special Topics in History 1-3.
Presentation of material normally not available in regular history course offerings, or offering of new introductory courses on a trial basis. Students cannot receive credit for multiple sections of HI 298 unless the topics are different.

HI 300 Sophomore Seminar in History 3.
Prerequisite: Sophomore standing, History Majors.
Introduction to the process of researching and writing history. Techniques for locating and interpreting primary sources. The craft of historical writing. Analysis and criticism of the varieties of history. Basic computer literacy: basic computing terms, electronic mail, online searching of the NCSU Libraries, use of the Internet, and word processing.

HI 305 Frauds and Mysteries of the Past 3.
Myths, mysteries, misconceptions, and hoaxes in history and archaeology. Examination of popular fascinations with the past, fallacies invoked in historical myths, and misappropriation of the past. Students learn about and implement methods and evidence used by scholars to interpret past peoples and events, logic, skepticism, and critical thinking, interpretative, and analytical skills. Students apply these skills in discussions, in-class activities, and creative assignments to debunk and disprove inaccurate and problematic claims about the past. Case studies of topics such as: stereotypes about early humans, Atlantis, mythical beasts, pyramid alignment, conspiracy theories, art fakes and forgeries, and alien visitations.

HI 307 Jewish History 3.
Prerequisite: 3 hours of History or Sophomore standing.
Survey of major topics in the history of the Jews, focusing on the development of Jewish life on the European continent but also covering the patterns of migration that created a global diaspora as well as the forces that formed modern Israel.
HI 320 Religion in American History 3.
Prerequisite: 3 hours of History or Sophomore standing.
Representative people, movements and thought in the major religions within the context of American society and culture.

HI 321 Ancient and Medieval Science 3.
Prerequisite: 3 hours of History or Sophomore standing.
Selected topics in the history of pre-modern science are studied for both their intrinsic interest and to gain perspective on the nature of modern science. Examples are taken from pre-history, Mesopotamia, Egypt, Greece, Rome, Islam, and the medieval Christian West, with the possibility of comparisons to other cultures.

HI 322 Rise of Modern Science 3.
Prerequisite: 3 hours of History or Sophomore standing.
Analysis of how "modern" science developed in Europe since the 1500s, exploring the foundation of the ideas, scientific practices, institutions, and cultural meaning and power of science in modern society. Examples taken from the creation of the mechanistic worldview and Newtonian science, and the development of modern disciplines such as chemistry, geology, biology, and physics.

HI 324 History of Common Law and Constitution 3.
Survey of the development of common law and constitution from the earliest Roman and Anglo-Saxon beginnings to the era of the French and American Revolutions. The focus will be on the European social, political and intellectual contexts within which Anglo-American law emerged, and the foundations of legal and constitutional principles. Topics include the origins of courts and the judiciary; the evolution of jury trial and the early history of the law of evidence; conflicts and compromised between secular and ecclesiastical law; rights and limits to property ownership at common law; and problems regarding the legal status of women, children, servants and slaves.

HI 325 Germany and the World Wars 3.
Prerequisite: 3 hrs of History or Sophomore Standing.
Germany's rise as a world power in the years prior to World War I, the emergence of Adolf Hitler and national socialism, and the consequences in defeat of World War II. Topics include nationalism, industrialism and the struggle of workers, imperialism, religious minorities and racial theories, sexual revolution, democratization, international relations and war, postwar occupation and reconstruction, and popular culture in music and film.

HI 335 The World at War 3.
Prerequisite: 3 hours of History.
Comparative history of the experience of war over time and place. Topics include the interactions between war and society; effects on combatants and non-combatants, especially women and children; and the role of technology.

HI 338 Empire, War, and Revolution in Russia 3.
Prerequisite: 3 hours of History or Sophomore standing.
Survey of Russian history since the advent of modern reform following the 1861 Serf Emancipation. The course treats the failure of an increasingly outdated monarchy to cope with the rise of an influential urban educated class, and industrial work force, and Populist and Marxist revolutionary movements. The course traces the degeneration of the 1917 socialist revolution into a hardened dictatorship which, forced by conditions outside its control, waged a destructive but victorious war, saving Europe from Nazism. It treats the 1991 Soviet collapse and the challenges and failures of the post-Stalin and post-Soviet periods.

HI 341 Technology in History 3.
Prerequisite: 3 hours of History or Sophomore standing.
The role of technology in society from earliest times to the present. Major achievements in technology and an examination of the nature of invention, innovation and adaptation of technologies and their impact on Western Civilization.

HI 346 Introduction to Civil War and Reconstruction 3.
Survey of the causes, trajectories, and consequences of the American Civil War and the social, political, and economic struggles of Reconstruction with an emphasis on divisions by region as well as race, class, and gender.

HI 350 American Military History 3.
Prerequisite: 3 hours of History or Sophomore standing.
American military experience and its relationship to other historical developments. Use of military force in terms of strategy and tactics and as an element in the nation's diplomatic, political, social, economic and intellectual life.

HI 351 U.S. Naval History 3.
Prerequisite: 3 hours of History or Sophomore standing.
The role of the U.S. Navy in American history, Sea power, national defense and foreign policy. The impact of technology on naval warfare and the historical evolution of missions of the U.S. Navy.

HI 354 The Rise of the American Empire 3.
This course investigates the rise of the American Empire from the Spanish American War of 1898 through the 2001 attacks on the World Trade Center. The purpose of the course is not only to acquaint you with the crises and triumphs of US foreign policy from 1898 to 2001, but also to help you develop your own analysis of whether the acquisition of empire was accidental or deliberate, or a combination of both.

HI 360 U.S. Agricultural History 3.
U.S. Agricultural history from colonial era to present. Attention to the major economic, social, political, environmental and cultural forces that shaped American agriculture from the 16th century to 21st century. Discussion of the role of technological change and evolution of governmental policy in U.S. agriculture. Exposure to major episodes demonstrating fundamental changes and continuities in U.S. agriculture. Discussion of the diversity of American farmers and farmworkers and their struggles for equality and access.

HI 364 History of North Carolina 3.
Prerequisite: 3 hours of History or Sophomore standing.
History of North Carolina from early European exploration to the present. Features of North Carolina society which made this state similar to and different from other southern states and the nation as a whole.

HI 365 The American West 3.
Prerequisite: 3 hours of History or Sophomore standing.
A history of the American Frontier with emphasis on the trans-Mississippi West. Cycles of exploration, conquest, and exploitation of this region. Influence of the frontier in the development of the United States.

HI 366 Native American History 3.
An introductory interpretation of the varied historical experiences of many nations native to North America from the first migrations of peoples into the continent until the present, including the variety and diversity of Indian cultures and experiences; native resistance to colonialism, expansion, and U.S. federal policies; and the survival and continuity of native cultures and peoples through more than four centuries of contact, conquest, and change.
HI 370 Modern Egypt 3.
Prerequisite: 3 hours of History or Sophomore standing.
Exploration of the political, socio-economic, and cultural history of Egypt from the end of the 18th century (the 1798 exploration led by Bonaparte) to the present day; including the late Ottoman period (1798-1805), the birth of the modern state (1805-1922), Egypt's liberal experiment (1922 - 1952), the Nasser era (1952-1970), the neo-liberal age (since 1970), and concluding with the January 25th Revolution. The investigation follows two main threads: the conflictual relationships that developed over the past two centuries between the state and society in all its diversity, and the continuous struggle over the definition of the Egyptian nation that these conflicts have generated.

HI 371 Modern Japan, 1850 to Present 3.
Prerequisite: 3 hours of History or Sophomore standing.
Survey of Japan's emergence as a modern nation and world power. Topics include nation-state formation; modernization and its dislocations; democratization and authoritarianism; imperialism, international politics, and war; postwar reforms; changing gender relations; popular culture; and social problems.

HI 372 African-American History Through the Civil War, 1619-1865 3.
Prerequisite: 3 hours of History or Sophomore standing.
African background and continuity of the particular role, experience and influence of African Americans in the United States through the Civil War.

HI 373 African-American History Since 1865 3.
Prerequisite: 3 hours of History or Sophomore standing.
The history of African-Americans from the Reconstruction era through the Civil Rights movement of the 1950s and 1960s to the present.

HI 374 Visual Culture of Modern South Asia 3.
Prerequisite: 3 hours of History or Art Studies or Sophomore Standing.
History of visual-cultural production in expressing and shaping socio-political configurations in the South Asian subcontinent. Treats visual evidence over 300 years to understand the integrative relationship and flow of cultural production across elite patronage and popular values through common themes and stories. Changing state formations and power relationships-- from the Mughal empire and its successor states through British imperial control and after independence-- are studied as contexts for the visual culture that emerges and changes across these time periods. Knowledge gained from HI 263 [Asian Civilizations to 1800] or HI 264 [Modern Asia] is helpful but not required.

HI 380 History of Nonprofits, Philanthropy, and Social Change 3.
Prerequisite: 3 hours of History or Sophomore standing.
This course explores the historical development of nonprofits and philanthropy in the United States from the colonial period to the present: the origins of charity and philanthropy as concepts for social change and social justice, the rise of benevolent societies in the nineteenth century, the creation of philanthropic foundations and advocacy organizations in the twentieth century, and the construction of complex relationships between modern nonprofits, the state, and the private sector.

HI 381 NGO Nonprofits in a Global Context 3.
Requisite: Sophomore Standing or Above.
Non-Governmental Organizations (NGOs) are a crucial component and a revealing characteristic of the strength and effectiveness of a country's civil society. Examining their histories outside of the U.S. gives us a window into global culture, values, and modes of everyday life, and into notions about "charity" and "public good" in a given society. We will use India as a case study to develop a set of questions about how NGOs function in different societies, examining how researchers and activists partner with NGOs in different parts of the world to address pressing environmental, economic, social, and cultural-production issues.

HI 395 History: Study Abroad 1-3.
Prerequisite: 3 hours of History or Sophomore standing.
Topical History courses taught in NCSU Study Abroad programs. (Current listings available in Study Abroad Office, CHASS Dean's Office and History Department).

HI 400 Civilization of the Ancient Near East 3.
Prerequisite: 3 hours of History.
The civilization of Mesopotamia and Egypt from earliest times to the fall of Babylonia in 539 B.C. Credit for both HI 400 and HI 500 is not allowed.

HI 402 Early Christianity to the Time of Eusebius 3.
Prerequisite: One of: REL 312, REL 317, or HI 207.
Growth and diffusion of early Christianity from the end of the first century up to the time of Eusebius and the conversion of Constantine (early fourth century); Christianity in its Greco-Roman environment; Roman policy towards Christianity; heterodox Christian movements; anti-heretical writings; orthodox institutions of authority.

HI 403 Ancient Greek Civilization 3.
Prerequisite: 3 hours of History.
The history of the Hellenes from the Minoan civilization through Alexander's legacy, with readings in Herodotus and Thucydides. Credit will not be given for both HI 403 and HI 503.

HI 404 Rome to 337 A.D. 3.
Prerequisite: 3 hrs. of History.
The development of ancient Rome from its origins in Italy, through the rise as an Empire embracing the entire Mediterranean World and Western Europe, to Constantine, Christianity and the foundation of Constantinople. Examines critically the political achievement of a people who rose from an obscure Italian city to a world empire, with emphasis on the analysis of primary sources. Credit will not be given for both HI 404 and HI 504.

HI 405 History and Archaeology of the Roman Empire 3.
Prerequisite: 3 hrs. of History.
Analysis of Rome's rule over the Mediterranean World in the first four centuries A.D. through the use of literary and archaeologic sources. Special emphasis on imperial army and frontier security. Credit will not be given for both HI 405 and HI 505.

HI 406 From Roman Empire to Middle Ages 3.
Prerequisite: 3 hrs. of History.
Late Antiquity and the early Middle Ages. The transition from classical civilization to the basis of modern civilizations; the fall of Rome, the Germanic kingdoms, Byzantium, the establishment of Christianity, the birth and growth of Islam. Credit will not be given for both HI 406 and HI 506.

HI 407 Islamic History to 1798 3.
Prerequisite: 3 hrs. of History.
Credit will not be given for both HI 407 and HI 507. The history of the Islamic Near East to 1798. Topics include the East Mediterranean before Islam, Muhammad and the development of Islam, sources of Muslim civilization, Islamic law, science, philosophy, art and architecture, Islam in Spain, India, Asia and Africa, the Crusades, the Ottomans, Islam and Europe.

HI 408 Islam in the Modern World 3.
Prerequisite: 3 hours of history or religious studies.
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamicate empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL/HI 408 and REL/HI 508.
HI 409 The High Middle Ages 3.
Prerequisite: 3 hrs. of History.
Medieval culture from 10th through 13th centuries: revival of the Roman Empire, monastic and papal reform, rise of universities, evolution of representative bodies, the Gothic style, troubadour and goliardic poetry, scholasticism, and revival of Roman law. Credit will not be given for both HI 409 and HI 509.

HI 410 Italian Renaissance 3.
Prerequisite: 3 hrs. of History.
Renaissance humanism, an educational ideal and an awareness of man as the sole creator in the historical world, is examined in its relationship to the Italian republics and princedoms of the 14th through the 16th century. Credit will not be given for both HI 410 and HI 510.

HI 411 Trials of Faith: Religious Reformation in Early-Modern Europe 3.
Prerequisite: 3 hrs. of History.
Examination of the great disruption in European civilization associated with the Protestant and Catholic Reformations. The course considers the new religious ideas and practices associated with the Reformations and transformation they produced in European political and economic life; the violence they provoked; the new thinking about families and gender roles they encouraged, the spread of European religions around the globe with European voyages of discovery and conquest, and the beginning of ideas about religious toleration. Credit will not be given for both HI 411 and HI 511.

HI 412 The Sexes and Society in Early-Modern Europe 3.
Prerequisite: 3 hrs. of History.
Examination of changes in gender relations; ideas about the sexes, femininity, and masculinity; the roles of women and men in political, religious, economic, scientific, and family life in Europe between the late Middle Ages and the French Revolution. Credit for HI 412 and HI 512 is not allowed.

HI 414 From Kings to Revolution: The History of Early-Modern France 3.
Prerequisite: 3 hrs. of History.
Examination of the most politically powerful and culturally dominant kingdom in early-modern Europe, which dissolved into a revolution that destroyed its monarchy while establishing ideas about democracy and equality. From the glories of the Versailles palace to the misery of peasant villages, topics include the beginnings of the French state and nation in the warfare and religious conflicts of 1500s, political and economic developments, the growth of an internationally influential French culture, religious change, controversies over gender roles, and the origins of the French Revolution. Credit will not be given for both HI 414 and HI 514.

HI 415 The French Revolution 3.
Prerequisite: 3 hrs. of History.
Broadly based analysis of France's first revolutionary era; the enlightenment and its impact, the causes and character of the Revolution in France; impact of these events in France and Europe. Credit will not be given for both HI 415 and HI 515.

HI 418 Fascist Italy and Nazi Germany 3.
Prerequisite: 3 hrs. of History.
Fascism as a theoretical concept, rise of fascism in Italy and Germany, seizure of power by Mussolini and Hitler, organization of the economy, churches, military, women, youth, and culture under the dictatorships. Students will not receive credit for both HI 418 and HI 518.

HI 419 Modern European Imperialism 3.
Prerequisite: 3 hrs. of History.
Historical background of European overseas expansion; its impact on the economics, politics and culture of both Europe and the colonized world; the significance of imperialism and anti-colonial nationalism in shaping the modern world. Credit will not be given for both HI 419 and HI 519.

HI 421 European Intellectual History: The Eighteenth Century 3.
Prerequisite: 3 hrs. of History.
Historical examination of some of the major figures of the European Enlightenment, beginning with Locke and ending with Kant. Credit will not be given for both HI 421 and HI 521.

HI 422 European Intellectual History: The 19th Century 3.
Prerequisite: 3 hrs. of History.
Historical examination of some of the major figures of European thought during the 19th century, beginning with the enthusiasm of the period of the French Revolution and ending with the disillusionment of the fin de siecle. Credit will not be given for both HI 422 and HI 522.

HI 423 Women in European Enlightenment 3.
Prerequisite: 3 hrs. of History.
Historical analysis of feminist thought and action during the Enlightenment of the 1700s. Topics include women's role in the development of Western knowledge and science, historical construction of the gendered "nature" of women, education and political resources available to women, and their strategies for emancipation. Credit will not be given for both HI 423 and HI 523.

HI 425 Tudor and Stuart England 3.
Prerequisite: 3 hrs. of History.
British history from the Reformation through the Civil War. Emphasis on key developments in social, political and economic life: The development of a new concept of kingship, the growing independence of Parliament, the search for religious uniformity and the changing status of the aristocracy and gentry. Credit will not be given for both HI 425 and HI 525.

HI 429 20th Century Britain 3.
Prerequisite: 3 hours of History.
British political, social and economic history since 1914, with reference to the effects of two world wars, the growth of the Welfare State, Britain's decline as a power, and its search for a new role in the world. Credit will not be given for both HI 429 and HI 529.

HI 430 Modern France 3.
Prerequisite: 3 hrs. of History.
French history from the downfall of Napoleon I to the present, with a short introductory survey of the Old Regime and the French Revolution. Cultural, social and economic developments and political trends. Credit will not be given for both HI 430 and HI 530.

HI 437 Topics in Central and East European History 3.
Prerequisite: 3 hrs. of History.
Topical focus on specific problems and events occurring in the region in and between Germany and Russia in modern history. The course is designed to expose advanced undergraduates, principally history majors, to intensive reading, writing, and discussion of focused topics in the subject area. Previous modern European history credit is advised. This course is repeatable once for credit when offered with a different topic.
HI 440 American Environmental History 3.
Prerequisite: 3 hours of History.
Interactions between humans and their environments in America; environmental focus on themes in American history such as colonial settlement, industrialization, progressivism, the New Deal, the 1960s. Credit will not be given for both HI 440 and HI 540.

HI 441 Colonial and Revolutionary U.S 3.
Prerequisite: 3 hrs. of History.
Origins of the English colonies in America to the American Revolution. European background to colonization, merging of different cultures, effects of mercantile doctrine, causes of revolution. Credit will not be given for both HI 441 and HI 541.

Prerequisite: 3 hours of History.
Analysis of state and federal constitutions developed in the United States after 1776. Theories behind a federal constitution; the Philadelphia Convention of 1787; the ratification debate; and the bill of rights. Credit will not be given for both HI 442 and HI 542.

HI 443 U.S. Constitutional History to 1883 3.
Prerequisite: 3 hrs. of History.
This course examines the origins and development of the U.S. Constitution from the Articles of Confederation to 1883. The course specifically looks at the federal Convention of 1787, the national bank debate and early constitutional interpretation; the constitution and its interaction with politics, economics, and society; the powers of Congress - taxation, contracts, commerce and war. The course also examines sovereignty, slavery and civil rights. It ends with an analysis of the Civil War Amendments and the transformation in American constitutionalism. Credit for both HI 443 and HI 543 is not allowed.

HI 444 U.S. Constitutional History Since 1870 3.
Prerequisite: 3 hrs. of History.
Examines the transformation of American Constitutional thought after the Civil War; the triumph of nationalism and the evolution of a new federal theory; the rise and fall of federal protections of civil rights in the late 19th-century and the Civil Rights Revolution in the 20th century. Explores key concepts as civil liberties, judicial activism and judicial restraint; procedural and substantive due process, liberty of contracts and entrepreneurial liberty, Japanese internment, privacy, women and gender issues; explores free speech, religious freedom, civil liberties. Credit for both HI 444 and HI 544 is not allowed.

HI 445 Early American Frontier 3.
Prerequisite: 3 hrs. of History.
Examines the social, political, and cultural development of the eastern American frontiers between the early seventeenth and mid-nineteenth centuries. Addresses the relationships between settlers and environments, settlers and Native Americans. Explores the structure and life of pioneer families, the development of new institutions, the role of governments in regulating settlements, and the evolution of the "frontier myth." Credit cannot be given for both HI 445 and HI 545.

HI 446 Civil War and Reconstruction 3.
Prerequisite: 3 hrs. of History.
Examination of the historiography of the American Civil War and Reconstruction. Topics include the origins of the war, military strategy, the northern and southern homefront, nationalism and citizenship, slavery and freed labor, changing gender roles and ideologies, struggles over racial inequality, and conservatism and radicalism during Reconstruction. Credit will not be given for both HI 446 and HI 546.

HI 447 History of American Women to 1900 3.
Prerequisite: 3 hours of History.
The historical experience of women in America from the colonial period to 1890. Women's work, education, legal and political status, religious experience, and sex roles: age, class, race, sexual preference, and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 447 and HI (WGS) 547.

HI 448 American Women in the Twentieth Century 3.
Prerequisite: 3 hrs. of History.
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles, age, class, race, sexual preference and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 448 and HI (WGS) 548.

HI 449 U.S. Labor to 1900 3.
Prerequisite: 3 hrs. of History.
This course explores the history of work, workers, and working-class life and labor in the United States from the founding of the first European colonies to the beginning of the twentieth century: bound and free labor in colonial America, the transformation of urban workplace in the decades preceding the Civil War, slavery and class formation in the antebellum South, the effects of immigration on American workers, and the impact of race and gender on workers' solidarity. Credit will not be given for both HI 449 and HI 549.

HI 450 U.S. Labor Since 1900 3.
Prerequisite: 3 hrs. of History.
This course explores the history of work, workers, and working-class organizations in the twentieth century United States; with particular attention to three core issues in twentieth-century American labor history: whether the US South has a particular form of labor history; the historical struggle for workers' rights to collectively act and protest; and the intersections between race, ethnicity, immigration and labor in the twentieth-century US. Credit will not be given for both HI 450 and HI 550.

HI 451 The Vietnam War 3.
Prerequisite: 3 hours of History.
The Vietnam War in Vietnamese historical context. A study of major works on the legacy of French colonialism; the growth of Vietnamese radicalism and communism; World War II and the Vietnamese Revolution; the French Indochina War and political division; nation building in north and south Vietnam; conflict between north and south; American intervention; and the memory of war in Vietnam. Credit for both HI 451 and HI 551 is not allowed.

HI 452 Recent America 3.
Prerequisite: 3 hrs. of History.
Examination of contemporary opinions and historical interpretations of major problems in American life since 1939, including World War II, its social and economic consequences; Korea and the Cold War, big business and labor; civil rights and feminist movements; countercultures, Vietnam and Watergate. Credit will not be given both for HI 452 and HI 552.
HI 453 United States-Latin American Relations Since 1823 3.
Prerequisite: 3 hrs. of History.
Critical analysis of the last two centuries of relations between the US and Latin America. Exploration of major policies using primary sources and declassified CIA documents. Major themes include US economic, political, and military influence, covert and overt US interventions, and response by Latin American governments. Historical perspectives on contemporary inter-American problems on drugs, environment, debt crisis, human rights abuses, and the impact of the Latino population in the U.S. Credit will not be given both for HI 453 and HI 553.

HI 454 History of U.S. Foreign Relations, 1900-Present 3.
Prerequisite: 3 hrs. of History.
America’s emergence as a world power; American diplomatic history since 1900; the expansion of American economic and cultural relations; the evolution of the American foreign policy bureaucracy; and the historical forces and personalities that have shaped American relations with other nations. Credit for both HI 454 and HI 554 will not be allowed.

HI 455 History of the Civil Rights Movement 3.
Prerequisite: 3 hrs. of History.
The black revolution; stages and leaders of the movement; successes and failures in the fight for desegregation, the vote, and economic opportunity; impact of Civil Rights movement on the United States. Credit will not be given both for HI (AFS) 455 and HI 555.

HI 456 Early American Thought 3.
Prerequisite: 3 hours of History.
American intellectual history to 1865. Influence of reformation, enlightenment, scientific revolution, capitalism and romanticism on social and political order. Credit will not be given for both HI 456 and HI 556.

Prerequisite: 3 hrs. of History.
American intellectuals and their views on 20th-century topics such as politics, culture, race and gender in historical context. Credit for both HI 457 and HI 557 is not allowed.

HI 458 American Historical Biography 3.
Prerequisite: 3 hrs. of History.
Learn about the past through the eyes of those who made it. This course explores the multiple ways that historical biographers construct narratives of an individual life and how these relate to broader themes in American history. Credit will not be given for both HI 458 and HI 558.

HI 459 The Early American Republic 3.
Prerequisite: 3 hrs. of History.
Examines the social, political, and cultural development of the Early Republic, the period in American history roughly from the Revolutionary War through the Administration of John Quincy Adams. Employs the life of Thomas Jefferson—the quintessential American, as the foundation for delving into the historical problems, interpreting primary sources, and analyzing secondary sources. Encourages graduate students to analyze the ways in which historiographic debates complicate our understanding of the Early American Republic. Credit will not be given for both HI 459 and HI 559.

HI 461 Civilization of the Old South 3.
Prerequisite: 3 hrs. of History.
The distinctive features of the Old South as part of the regional development of United States history. Consideration of colonial factors in the making of the South, development of the plantation system and slavery, Southern social order, intellectual and cultural life, economic development, and rise of Southern nationalism. Credit will not be given for both HI 461 and HI 561.

HI 462 Southern History since the Civil War 3.
Prerequisite: 3 hours of History.
Exploration of many American “Southerns” from Reconstruction to the present. How race/ethnicity, gender, class, geography, sexuality, and culture inform “Southern” identity; major political and economic changes; and the region’s relationship to the nation and the world. Credit will not be given for HI 462 and HI 562.

HI 465 Oil and Crisis in the Gulf 3.
Prerequisite: 3 hrs. of History.
Historical roots and development of the Persian Gulf region from the late nineteenth century until the present with an emphasis on the social, economic, cultural and political transformations following the discovery of oil, and subsequent events such as the Arab Oil embargo of 1973, the Iranian Revolution, the Iran-Iraq war, and the two Gulf wars.

HI 466 History of the Palestinian-Israeli Conflict 3.
Prerequisite: 3 hrs. of History.
Historical roots and development of the Palestinian-Israeli conflict from the late nineteenth century until the present through the study of the history and historiography of Zionism, Palestinian nationalism, creation of the state of Israel, establishment of settlements, conflicts and peace negotiations, as well as a study of the impact of this conflict on both Israeli and Palestinian societies, economies and cultures.

HI 467 Modern Mexico 3.
Prerequisite: 3 hours of History.
Major developments in Mexican national life since 1821. The 19th century: the era of Santa Anna, the war with the United States, the Reform, the French intervention, and the dictatorship of Porfirio Diaz. The 1910 Revolution and the resulting transformation of Mexico’s political, social and economic institutions. Reading knowledge of Spanish helpful but not required.

HI 469 Latin American Revolutions in the Twentieth Century 3.
Prerequisite: 3 hrs. of History.
Comparative analysis of causes, participants, process, and outcome of revolutions in Mexico, Bolivia, Cuba, and Central America. Credit for both HI 469 and HI 569 will not be given.

HI 470 Exploring World History 3.
Prerequisite: 3 hours of History.
Introduction to the methods, themes, and narratives of world history. As a distinct approach to historical study, world history focuses on dynamic connections and relationships among regions of the world and the variety of global processes - related to trade, religion, production, consumption, migration, imperialism, disease, and technologies - that connected them. The course is a suggested elective for future teachers who will teach world history in high school.

HI 471 Revolutionary China 3.
Prerequisite: 3 hrs. of History.
China 1900 to present. Examination of political, cultural, and socio-economic revolutionary phases of China’s 20th-century transformation from traditional empire to communism. Particular attention to post-1949 problems of nation-building. Credit will not be given for both HI 471 and HI 571.

HI 473 Japan’s Empire in Asia, 1868-1945 3.
Prerequisite: 3 hrs. of History.
An advanced survey of Japanese relations with Asia in the nineteenth and twentieth centuries. Structures and ideologies of imperialism and colonialism; modernization, nationalism and social change; migration and mobility; resistance and collaboration; and legacies of empire. Credit will not be given for both HI 473 and HI 573.
HI 474 Modern India 3.
Prerequisite: 3 hours of History.
The history of the Indian sub-continent, from the 16th century to the present. Focus on political, economic and cultural change under the Mughal Empire and the British Raj; the problems of independent India, Pakistan and Bangladesh.

HI 475 History of the Republic of South Africa 3.
Prerequisite: 3 hours of History.
Evolution of the Republic of South Africa's society, with emphasis on the interaction of diverse peoples and cultures. Particular attention is given to the period since 1870. Credit will not be given for both HI (AFS) 475 and HI 575.

HI 476 Leadership in Modern Africa 3.
Prerequisite: 3 hours of History.
Recent sub-Saharan African political history (excluding South Africa). Overview of concepts, vocabulary, historical trends. Detailed examination of specific African countries as case studies, such as Ghana, Nigeria, Zimbabwe, Tanzania. Credit will not be given for both HI (AFS) 476 and HI 576.

HI 477 Women in the Middle East 3.
Prerequisite: 3 hours of History.
The varied forces influencing lives of women in Middle East from beginning of Islam to present.

HI 478 Islam and Christianity in Sub-Saharan Africa 3.
Prerequisite: 3 hours of History.
Expansion and interaction of Islam and Christianity in sub-Saharan Africa in the nineteenth and twentieth centuries, and their influence and impact on the economy, politics, and society. Topics include missionary activity, resistance to imperial authority, the role of the churches, and the influence of religion on leadership, education, nationalism, and post-colonialism. Credit will not be given for both HI 478 and HI 578.

HI 479 Africa (sub-Saharan) in the Twentieth Century 3.
Prerequisite: 3 hours of History.
Developments in sub-Saharan Africa during the colonial period, from the end of the nineteenth century to the advent of decolonization in the early 1960s. Interplay of political, social, economic and cultural factors in the experiences of African peoples during this period. Credit will not be given for both HI (AFS) 479 and HI 579.

HI 481 History of the Life Sciences 3.
Prerequisite: 3 hrs. of History.
Historical context of the individuals, ideas, scientific practices, and social goals that created the core concepts of the modern biological sciences, from Renaissance medicine to molecular biology, with a focus on interconnections of the scientific knowledge and perspective of the life sciences with other aspects of culture, including other sciences, views about nature and life, religious belief, medical practice, and agriculture. Topics include the development of biological experiments; theories of ecology and evolution; the chemical understanding of health, food, and drugs; and the modern molecular revolution. Credit will not be given for both HI 481 and HI 581.

HI 482 Darwinism in Science and Society 3.
Prerequisite: 3 hrs. of History.
Scientific development of Darwinism and its reception by the scientific community and the general public. Social impact of theories of evolution as reflected in Social Darwinism, eugenics, sociobiology, and relationship of sciences to ethics and religion. Credit will not be given both for HI 482 and HI 582.

HI 483 Science and Religion in European History 3.
Prerequisite: 3 hrs. of History.
Are science and religion inherently in conflict with each other? Historical analysis of the idea of "warfare between religion and science," treating their complex relationship and respective cultural authority before 1800, including the relationship of science and religion in Europe during periods of the Reformation, the creation of early modern states, and the Enlightenment of the 1700s. Topics include visions of nature and utopias, the creation of mechanistic science in the 1600s, and natural theology. Credit will not be given for both HI 483 and HI 583.

HI 484 Science in European Culture 3.
Prerequisite: 3 hours of History.
The role of science in shaping early modern European identity, culture and polity in the 1600s and 1700s. Drawing on documents and material culture, topics include the meaning of natural wonders, explorations, travel literature, instruments and mapping, colonies and empire, and universal expos. Credit will not be given for both HI 484 and HI 584.

HI 485 History of American Technology 3.
Prerequisite: 3 hours of History.
Technology in American history: the ideological, social, economic, and institutional contexts of technological change from the 1760s to the present. Impacts of new technological systems. Credit will not be given for both HI 485 and HI 585.

HI 486 Science and Empire 3.
Prerequisite: 3 hours of History.
The development of European science in the context of world exploration, global commercial expansion, local knowledge, and visions of colonization and empire. Credit will not be given for both HI 486 and HI 586.

HI 491 Seminar in History 3.
Prerequisite: HI 300 and 18 hours of History.
Detailed investigation of selected topics in history. Consult Department of History for specific topics.

HI 495 Honors Research in History I 2.
Prerequisite: Senior in History Honors Program.
Preparation of the honors thesis. Topics and procedures to be determined by the student and the supervising faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

HI 496 Honors Research in History II 4.
Prerequisite: HI 495, Senior in History Honors Program.
Completion of the honors thesis. Topics and procedures to be determined by the student and the supervising faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

HI 498 Independent Study in History 1-6.
Prerequisite: 3 hours of History.
Extensive readings on predetermined topics focused around a central theme. Permission of the department is required. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.
HI 499 Special Topics in History 1-3.
*Prerequisite: 3 hours of History.*
Timely topical courses or experimental course offerings in advanced historical study.

HI 500 Civilizations of the Ancient Near East 3.
The civilizations of Mesopotamia and Egypt from earliest times to fall of Babylon in 539 B.C. Credit for both HI 400 and HI 500 is not allowed.

HI 503 Ancient Greek Civilization 3.
The history of the Hellenes from the Minoan civilization through Alexander's legacy, with readings in Herodotus and Thucydides. Credit will not be given for both HI 403 and HI 503.

HI 504 Rome To 337 A.D. 3.
Development of ancient Rome from its origins in Italy, through its rise as an Empire embracing entire Mediterranean World and Western Europe, to Constantine, Christianity and the foundation of Constantinople. Critical examination of political achievement of a people who rose from an obscure Italian city to a world empire, with emphasis on analysis of primary courses. Credit for both HI 404 and HI 504 is not allowed.

HI 505 History and Archaeology Of the Roman Empire 3.
Analysis of Rome's unparalleled rule over the entire Mediterranean World in first four centuries A. D. through use of literary and archaeological sources. Special emphasis on imperial army and frontier security. Credit for both HI 405 and HI 505 is not allowed.

HI 506 From Roman Empire To Middle Ages 3.
Late Antiquity and the early Middle Ages. The transition from classical civilization to basis of modern civilizations: the Fall of Rome, the Germanic kingdoms, Byzantium, establishment of Christianity, birth and growth of Islam. Credit for both HI 406 and HI 506 is not allowed.

HI 507 Islamic History To 1798 3.
History of Islamic Near East to 1798. The East Mediterranean before Islam, Muhammad and the development of Islam, sources of Muslim civilization; Islamic law, science, philosophy, art and architecture; Islam in Spain, India, Asia and Africa, the Crusades, the Ottomans; Islam and Europe. Credit for both HI(REL) 407 and HI 507 is not allowed.

HI 508 Islam in the Modern World 3.
*Prerequisite: Graduate standing.*
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamic empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL/HI 408 and REL/HI 508.

HI 509 The High Middle Ages 3.
Medieval culture 936-1250: revival of the Roman Empire, monastic and papal reform, rise of universities, evolution of representative bodies, the Gothic style, troubadour and goliardic poetry, scholasticism and revival of Roman law. Credit for both HI 409 and HI 509 is not allowed.

HI 511 Trials of Faith: Religious Reformation in Early-Modern Europe 3.
Examination of the great disruption in European civilization associated with the Protestant and Catholic Reformations. The course considers the new religious ideas and practices associated with the Reformations and transformation they produced in European political and economic life; the violence they provoked; the new thinking about families and gender roles they encouraged, the spread of European religions around the globe with European voyages of discovery and conquest, and the beginning of ideas about religious toleration. Credit will not be given for both HI 411 and HI 511.

HI 512 The Sexes and Society in Early-Modern Europe 3.
Examination of both changes in gender relations; ideas about the sexes, femininity, and masculinity; the roles of women and men in political, religious, economic, scientific, and family life in Europe between the late Middle Ages and the French Revolution. Credit for both HI 512 and 412 is not allowed.

HI 514 From Kings to Revolution: The History of Early-Modern France 3.
Examination of the most politically powerful and culturally dominant kingdom in early-modern Europe, which dissolved into a revolution that destroyed its monarchy while establishing ideas about democracy and equality. From the glories of the Versailles palace to the misery of peasant villages, topics include the beginnings of the French state and nation in the warfare and religious conflicts of 1500s, political and economic developments, the growth of an internationally influential French culture, religious change, controversies over gender roles, and the origins of the French Revolution. Credit will not be given for both HI 414 and HI 514.

HI 515 Revolutionary Europe 3.
A broadly based analysis of France's first revolutionary era. The Enlightenment and its impact, causes and character of the Revolution in France and impact of these events in France and Europe. Credit for both HI 415 and HI 515 is not allowed.

HI 518 Fascist Italy and Nazi Germany 3.
*Prerequisite: 6 hours of Advanced History.*
Fascism as a theoretical concept, rise of fascism in Italy and Germany, seizure of power by Mussolini and Hitler, organization of economy, churches, military, women, youth and culture under dictatorships. Students will not receive credit for both HI 418 and HI 518.

HI 519 Modern European Imperialism 3.
*Prerequisite: Graduate standing.*
Historical background of European expression; its impact on the economics, politics and culture of both Europe and the colonized world; the significance of imperialism and anti-colonial nationalism in shaping the modern world. Credit for both HI 419 and HI 519 is not allowed.

HI 521 European Intellectual History: The Eighteenth Century 3.
Historical examination of some of major figures of the European Enlightenment, beginning with Locke and ending with Kant. Credit for both HI 421 and HI 521 is not allowed.

HI 522 European Intellectual History: The 19TH Century 3.
Historical examination of some of major figures of European thought during 19th century, beginning with enthusiasm of the period of the French Revolution and ending with the disillusionment of the fin de siecle. Credit for both HI 422 and HI 522 is not allowed.

HI 523 Women in European Enlightenment 3.
Historical analysis of feminist thought and action during the Enlightenment of the 1700s. Topics include women's role in development of Western knowledge and science, historical construction of the gendered nature of women, education and political resources available to women, and their strategies for emancipation. Credit will not be given for both HI 423 and HI 523.

HI 525 Tudor and Stuart England 3.
British history from the Reformation to the Civil War. Primary emphasis on certain key developments in social, political and economic life, such as development of a new concept of kingship, the growing independence of Parliament, the search for religious uniformity and changing status of aristocracy and gentry. Credit for both HI 425 and HI 525 is not allowed.
HI 530 Modern France 3.
French history from the downfall of Napoleon I to the present, with a short introductory survey of the Old Regime and the French Revolution. Cultural, social and economic developments and political trends. Credit for both HI 430 and HI 530 is not allowed.

HI 533 Theory and Practice of Oral History 3.
Explores the practice of oral history. Examines historical works drawn primarily from oral sources. Teaches students to design and implement oral history projects based on independent research.

HI 534 Theory and Practice of Digital History 3.
Introduces students to the theory and practice of digital history. Students will examine theoretical scholarship on digital practices in history, exploring issues of capacity, accessibility, interactivity, and hypertextuality. Students will critique examples of digital history including digital archives, exhibits, scholarships, and teaching resources, and then apply conceptual knowledge in the creation of their own digital history projects. Graduate standing or PBS status.

HI 539 History Of the Soviet Union and After 3.
History of the Soviet state and society from the 1917 Revolution, including post-Soviet situation. Political disarray and resistance to the Bolshevik regime, 1917-21; industrialization, urbanization and application of coercive techniques of rule; popular reconciliation with Party state and great power status during World War II and after; fate of non-Russian nationalities; de-Stalinization, stagnation and failed attempt at Party renewal after 1985. Credit for both HI 439 and HI 539 is not allowed.

HI 540 American Environmental History 3.
Prerequisite: Graduate standing.
Interaction between humans and their environments in America; environmental focus on themes in American history such as colonial settlements, industrialization, progressivism, the new Deal, the 1960s. Credit will not be given for both HI 440 and HI 540.

HI 541 Colonial and Revolutionary U.S. 3.
Prerequisite: Graduate standing.
Origins of English colonies in America to the American Revolution. European background to colonization, merging of different cultures, effects of mercantile doctrine, causes of revolution. Credit for both HI 441 and HI 541 is not allowed. Credit for both HI 441 and HI 541 is not allowed.

Prerequisite: Graduate standing.
Analysis of state and federal constitutions developed in the United States after 1776. Theories behind a federal constitution; the Philadelphia Convention of 1787; the ratification debate; and the bill or rights. Credit will not be given for both HI 442 and HI 542.

HI 543 U.S. Constitutional History to 1883 3.
Prerequisite: Graduate standing.
Examines the origins and development of the United States Constitution from the Articles of Confederation to 1883. Analyzes the Federalist-Antifederalist debates; evaluates the constitution and its interaction with politics, economics, and society. Studies the powers of Congress-taxation, contracts, commerce, war, and First Amendment issues. Explores sovereignty, civil rights, and the new federalism after the Civil War. Examines the meaning of procedural and substantive due process, and the state action theory. Appraises the transformation in American constitutionalism during Reconstruction. Students may not earn credit for both HI 443 and HI 543.

HI 544 US Constitutional History Since 1870 3.
Prerequisite: Graduate standing.
Examines the transformation of American constitutional thought after the Civil War; the triumph of nationalism and the evolution of a new federal theory; the rise and fall of federal protections of civil rights. Explores key concepts such as civil liberties, judicial activism and judicial restraint; analyzes procedural and substantive due process, liberty of contracts and entrepreneurial liberty; evaluates Japanese internment, privacy, gender equality, free speech, religious freedom, civil liberties. Credit not given for both HI 444 and 544.

HI 545 Early American Frontier 3.
Examines the social, political, and cultural development of the eastern American frontiers between the early seventeenth and mid-nineteenth centuries. Addresses the relationships between settlers and environments, settlers and Native Americans. Explores the structure and life of pioneer families, the development of new institutions, the role of governments in regulating settlements, and the evolution of the “frontier myth”. Graduate standing or permission of instructor. Credit cannot be given for both HI 445 and HI 545.

HI 546 Topics in Civil War and Reconstruction 3.
Prerequisite: Graduate standing.
Examination of the historiography of the American Civil War and Reconstruction. Topics include the origins of the war, military strategy, the northern and southern homefront, nationalism and citizenship, slavery and freed labor, changing gender roles and ideologies, struggles over racial inequality, and conservatism and radicalism during Reconstruction. Credit will not be given for both HI 446 and HI 546.

HI 547 History Of American Women To 1900 3.
Prerequisite: Graduate standing.
Historical experience of women in America from colonial period to 1890. Women's work, education, legal and political status, religious experience and sex roles: age, class, race, sexual preference and region as significant variables in women's experience. Credit for both HI (WGS) 447 and HI (WGS) 547 is not allowed.

HI 548 American Women In the Twentieth Century 3.
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles; age, class, race, sexual preference and region as significant variables in women's experience. Credit for both HI (WGS) 448 and HI (WGS) 548 is not allowed.

HI 549 U. S. Labor To 1900 3.
Prerequisite: Graduate standing.
This course explores the history of work, workers, and working-class life and labor in the United States from the founding of the first European colonies to the beginning of the twentieth century: bound and free labor in colonial America, the transformation of urban worklife in the decades preceding the Civil War, slavery and class formation in the antebellum South, the effects of immigration on American workers, and the impact of race and gender on workers' solidarity. Credit for both HI 449 and HI 549 is not allowed.

HI 550 U. S. Labor Since 1900 3.
Prerequisite: Graduate standing.
This course explores the history of work, workers, and working class organizations in the twentieth century United States; with particular attention to three core issues in twentieth-century American labor history: whether the US South has a particular form of labor history; the historical struggle for workers' rights to collectively act and protest; and the intersections between race, ethnicity, immigration and labor in the twentieth-century US. Credit for both HI 450 and HI 550 is not allowed.
HI 551 The Vietnam War 3.

Prerequisite: Graduate standing.
The Vietnam War in Vietnamese historical context. A study of major works on the legacy of French colonialism; the growth of Vietnamese radicalism and communism; World War II and the Vietnamese Revolution; the French Indochina War and political division; nation building in north and south Vietnam; conflict between north and south; American intervention; and the memory of war in Vietnam. Credit for both HI 451 and HI 551 is not allowed.

HI 552 Recent America 3.
Examination of contemporary opinions and "historical" interpretations of major problems in American life since 1939 including World War II, its social and economic consequences; Korea and the Cold War; big business and labor; civil rights and feminist movements; countercultures, Vietnam and Watergate. Credit for both HI 452 and HI 552 is not allowed.

HI 553 U. S.-Latin American Relations Since 1823 3.
Critical analysis of the last two centuries of relations between the US and Latin America. Exploration of major policies using primary sources and declassified CIA documents. Major themes include US economic, political, and military influence, covert and overt US interventions, and response by Latin American governments. Historical perspectives on contemporary inter-American problems on drugs, environment, debt crisis, human rights abuses, and the impact of the Latino population in the U.S. Credit will not be given both for HI 453 and HI 553.

HI 554 History Of U. S. Foreign Relations, 1900-Present 3.
American diplomatic history since 1900; the expansion of American economic and cultural relations; the evolution of the American foreign policy bureaucracy; and the historical forces and personalities that shaped American relations with other nations. Credit for both HI 454 and HI 554 is not allowed.

HI 555 History Of the Civil Rights Movement 3.

Prerequisite: 6 hours of Advanced History, Junior standing.
The "black revolution;" stages and leaders of the movement; successes and failures in fight for desegregation, the vote and economic opportunity; impact of Civil Rights movement on the United States. Credit for both HI (AFS) 455 and HI 555 is not allowed.

HI 556 Early American Thought 3.

Prerequisite: 3 hours of History.
American intellectual history to 1865. Influence of Reformation, enlightenment, scientific revolution, capitalism and romanticism on social and political order. Credit for both HI 456 and HI 556 is not allowed.

American intellectuals and their views on 20th-century topics such as politics, culture, race and gender in historical context. Credit for both HI 457 and HI 557 is not allowed.

HI 558 American Historical Biography 3.
Learn about the past through the eyes of those who made it. This course explores the multiple ways that historical biographers construct narratives of an individual life and how these relate to broader themes in American history. Credit will not be given for both HI 458 and HI 558.

HI 559 The Early American Republic 3.

Examine the social, political, and cultural development of the Early Republic, the period in American history roughly from the Revolutionary War through the administration of John Quincy Adams. Employs the life of Thomas Jefferson-the quintessential American-as the foundation for delving into historical problems, interpreting primary sources, and analyzing secondary sources. Encourages graduate students to analyze the ways in which historiographic debates complicate our understanding of the Early American Republic. Graduate standing or permission of instructor. Credit cannot be given for both HI 459 and HI 559.

HI 561 Civilization Of the Old South 3.
Distinctive features of the Old South as part of the regional development of the U. S. Colonial factors in the making of the South, development of the plantation system and slavery, Southern social order, intellectual and cultural life, economic development and rise of Southern nationalism. Credit for both HI 461 and HI 561 is not allowed.

HI 562 Southern History since the Civil War 3.

Prerequisite: 6 hours of Advanced History.
Exploration of many American "Souths" from Reconstruction to the present. How race/ethnicity, gender, class, geography, sexuality, and culture inform "southern" identity; major political and economic changes; and the region's relationship to the nation and the world. Credit will not be given for HI 462 and HI 562.

HI 563 Topics in History and Memory 3.
Explores how "collective memory" develops. Examines how memory is represented through public speeches, civic celebrations, monuments and memorials, and other forms of popular and political culture. Analyzes what is recalled, what is forgotten, and who decides. Asks why memory is made public. May be repeated for credit with a different topic.

HI 566 Readings in Native American History 3.
Readings in the varied historical experiences of nations native to North America from the first migrations of peoples into the continent until the present, including the variety and diversity of native cultures and experiences; native resistance to colonialism, expansion, and U.S. federal policies; and the survival and continuity of native cultures and peoples through more than four centuries of contact, conquest, and change.

HI 569 Latin American Revolutions In the Twentieth Century 3.
Comparative analysis of causes, participants, process and outcome of revolutions in Mexico, Bolivia, Cuba and Central America. Credit for both HI 469 and HI 569 is not allowed.

HI 571 Revolutionary China 3.
China 1900 to present. Examination of political, cultural and socio-economics revolutionary phases of China's 20th-century trans-formation from traditional empire to communism. Particular attention to post-1949 problems of nation building. Credit for both HI 471 and HI 571 is not allowed.

HI 572 The Rise of Modern Japan, 1850-Present 3.

Prerequisite: Graduate standing.
Japan's emergence as a modern nation and world power. Topics include nation-state formation; modernization and its dislocations; democratization and authoritarianism; imperialism, international politics, and war; postwar reforms; changing gender relations; popular culture; and social problems. Credit will not be given for both HI 472 and HI 572.
HI 573 Japan's Empire in Asia, 1868-1945 3.  
Prerequisite: 6 hours of advanced history.  
Advanced survey of Japanese relations with Asia in the nineteenth and twentieth centuries. Structures and ideologies of imperialism and colonialism; modernization, nationalism, and social change; migration and mobility; resistance and collaboration; and legacies of empire.

HI 575 History Of the Republic Of South Africa 3.  
Prerequisite: 6 hours of Advanced History.  
Evolution of Republic of South Africa's society, with emphasis on interaction of diverse peoples and cultures. Particular attention given to period since 1870. Credit for both HI 475 and HI 575 is not allowed.

HI 576 Leadership In Modern Africa 3.  
Conditions under which 20th century African leaders have obtained and exercised power. Case studies of prominent leaders, both radicals, reactionaries, democrats and tyrants, such as Nkrumah, Kenyatta, Nyerere, Amin, Cabral, Vorster and Senghor. Credit for both HI (AFS) 476 and HI 576 is not allowed.

HI 578 Islam and Christianity in Sub-Saharan Africa since the 19th Century 3.  
Expansion and interaction of Islam and Christianity in sub-Saharan Africa in the nineteenth and twentieth centuries, and their influence and impact on the economy, politics, and society. Topics include missionary activity, resistance to imperial authority, the role of the churches, and the influence of religion on leadership, education, nationalism, and post-colonialism. Credit will not be given for both HI 478 and HI 578; graduate standing for HI 578.

HI 579 African (sub-Saharan) in the Twentieth Century 3.  
Prerequisite: 6 hours of Advanced History.  
Developments in sub-Saharan Africa during colonial period, from end of 19th century to advent of decolonization in early 1960s. Interplay of political, social, economic and cultural factors in experiences of African peoples during this period. Students will not receive credit for both HI (AFS) 479 and HI 579.

HI 581 History Of Life Sciences 3.  
Prerequisite: 6 hours of Advanced History.  
Historical context of the individuals, ideas, scientific practices, and social goals that created the core concepts of the modern biological sciences, from Renaissance medicine to molecular biology, with a focus on interconnections of the scientific knowledge and perspective of the life sciences with other aspects of culture, including other sciences, views about nature and life, religious belief, medical practice, and agriculture. Topics include the development of biological experiments; theories of ecology and evolution; the chemical understanding of health, food, and drugs; and the modern molecular revolution. Credit will not be given for both HI 481 and HI 581.

HI 582 Darwinism In Science and Society 3.  
Prerequisite: 6 hours of Advanced History.  
Scientific development of Darwinism and its reception by the scientific community and the general public. Social impact of theories of evolution as reflected in Social Darwinism, eugenics, sociobiology, and relationship of sciences to ethics and religion. Credit for both HI 482 and HI 582 is not allowed.

HI 583 Science and Religion in European History 3.  
Prerequisite: 6 hours of Advanced History.  
Are science and religion inherently in conflict with each other? Historical analysis of the idea of the "warfare between religion and science," treating their complex relationship and respective cultural authority before 1800, including the relationship of science and religion in Europe during periods of the Reformation, the creation of early modern states, and the Enlightenment of the 1700s. Topics include visions of nature and utopias, the creation of mechanistic science in the 1600s, and natural theology. Credit will not be given for both HI 483 and HI 583.

HI 584 Science in European Culture 3.  
Prerequisite: 6 hours of Advanced History.  
The development of European science in the context of world exploration, global commercial expansion, local knowledge, and visions of colonization and empire. Credit will not be given for both HI 484 and HI 584.

HI 585 History of American Technology 3.  
Prerequisite: Graduate standing.  
Technology in American history: the ideological, social, economic, and institutional contexts of technological change from the 1760s to the present. Impacts of new technological systems. Credit for both HI 485 and HI 585 is not allowed.

HI 586 Science and Empire 3.  
The role of science in shaping early modern European identity, culture and polity in the 1600s and 1700s. Drawing on documents and material culture, topics include the meaning of natural wonders, explorations, travel literature, instruments and mapping, colonies and empire, and universal expos. Credit will not be given for both HI 486 and HI 586.

HI 587 Cultural Resource Management 3.  
Theoretical and practical overview of U.S. federal and state laws, institutions, and practices related to the inventory, evaluation, preservation, protection, and overall management of cultural resources; history and philosophical bases of Cultural Resource Management (CRM); professional ethics; indigenous and other stakeholder interests in CRM; and comparative national regulations outside the U.S. and the international heritage management and organizations. Graduate standing in history required.

HI 588 Family and Community History 3.  
Theory and research in family history, local history, and community studies, as well as application to public history presentation and community development. Graduate standing in history required.

HI 589 Interpretation in Historic Sites and Parks 3.  
Requisite: NCSU Graduate Students (MR or DR), NDS Students Only.  
Methodologies of interpreting history at historic sites and parks; training in interpretive tools linking historiography and research methodology with real places for presentation to the public; considerations of practical application. Five day trips required. Graduate standing or NDS.

HI 591 Museum Studies 3.  
Organization and operation of museums as historical agencies. Role of museums in historical research and education. Graduate standing or NDS.

HI 593 Material Culture 3.  
Current theories of material culture analysis and their application to history museums. Graduate standing or NDS.
HI 594 Cultural Heritage 3.
Use of the past and its cultures in reinforcing identities. Global development of heritage preservation, cultural resource management, and heritage tourism. Role of heritage professionals in identification, study, assessment, preservation, interpretation, management, and promotion of historic and cultural resources. Law and regulations that protect and preserve cultural resources. Graduate standing or NDS.

HI 595 Special Topics in History 1-6.
Prerequisite: Graduate standing.
Topical courses or experimental course offerings in advanced historical study.

HI 596 Introduction To Public History 3.
Historical origins of public history, applications of history to public life, historiography and major paradigms in the field, and debates about the public role of historians. Graduate standing in History.

HI 597 Historiography and Historical Method 3.
Major steps in development of historical investigation; analysis of elements of historical research; discussion of methodology and archival materials used by contemporary scholar history.

HI 598 Historical Writing 3.
Prerequisite: Graduate standing or PBS status.
Critical studies in the methods and practice of contemporary historical writing.

HI 599 Independent Study 1-3.
Prerequisite: Graduate standing or PBS status.
Individualized study conducted under supervision of graduate faculty. Course of study, assigned readings, course projects or papers, and methods of evaluating work to be detailed in writing and approved by department head.

HI 642 Internship In Public History 3.
Supervised internship experience with a public or private historical agency or institution or local, regional, or national significance. Graduate standing in History.

HI 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

HI 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

HI 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis Research.

HI 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

HI 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their thesis. Credits Arranged.

HI 787 African American Public History 3.
Issues in public history practice as they relate to the collection, preservation, and interpretation of African American cultural history. Graduate standing in history required.

HI 788 Native American Public History 3.
Issues in public history practice as they relate to the collection, preservation, and interpretation of Native American history. Graduate standing in history required.

HI 789 Public History in International Context 3.
Global public history since 1945, including functions of historical memory as they relate to global economics of public history, world heritage, and the transnational contexts for the work of historians.

HI 791 Research Seminar in Public History 3.
Identification and development of public history research subjects, sources and their evaluation, research techniques and problems, and writing and argumentation. Graduate standing only.

HI 792 Colloquium in History 3.
Advanced historiographical readings on major topics in history. May be repeated for credit with different topic. Graduate standing in History only.

HI 795 Special Topics 1-6.

HI 799 Independent Study 1-3.
Independent Study.

HI 885 Doctoral Supervised Teaching 1-3.

HI 889 Doctoral Dissertation Seminar 1.

HI 896 Summer Dissert Res 1.

HI 899 Doctoral Dissertation Preparation 1-3.

History of Art (HA)

HA - History of Art Courses

HA 201 History of Art From Ancient Greece Through the Renaissance 3.
Art from Ancient Greece and Rome through Italian Renaissance. Major art forms of painting, sculpture, and architecture.

HA 202 History of Art From the Renaissance Through the 20th Century 3.
Art from the Northern Renaissance in Europe through the 20th century in Europe and America: painting, sculpture and architecture recent mixed media techniques such as collage, and trottage.

HA 203 History of American Art 3.
A history of American Art (painting, sculpture and architecture) from the Colonial Period through the 20th century.
HA 240 Introduction to Visual Culture 3.
Prerequisite: Sophomore standing.
Introduction to the role of visual cultural production in the nineteenth and twentieth centuries in expressing and shaping both individual and collective identities. Case studies of imperialism, gender, and war draw from different regional histories and utilize a variety of visual genres - such as photography, popular posters, painting, advertising, and film stills - to study how visual culture can be used as evidence to understand the past, using the approaches of the disciplines of History and Art History.

HA 298 Special Topics in Art History 3.
Special topics in art history with emphasis on chronological periods such as 20th-century art of the Italian Renaissance or on fields of art such as paintings, sculpture, photography, or architecture.

HA 395 History of Art: Study Abroad 3.
Topical History of Art courses taught in NC State Study Abroad programs. (Current listings available in History Department, Study Abroad Office and CHASS Dean's Office.).

HA 401 19th Century European Art from Revolution to Post-Impressionism 3.
Prerequisite: HA 201 or HA 202.
From the politically charged art of the French Revolution, through Neo-classicism, Romanticism, Realism, Impressionism and Post-Impressionism, this course examines styles, subject matter and cultural context of the many, rapid artistic changes in the long 19th century.

HA 404 Italian Renaissance Art and Material Culture 3.
Prerequisite: 3 hrs. of HA.
From villas to teaspoons, this course investigates daily life in Renaissance Italy, 1300-1550, through the architecture, painting, sculpture, and art objects that people commissioned and used. Works of art will be analyzed in terms of style, subject matter, and historical context.

HA 410 History of the Art of Photography 3.
Prerequisite: 3 Hours of History of Art, Film, History, or Literature.
History of and the interaction between art and photography from the invention of photography to the present.

HA 498 Independent Study in History of Art 1-6.
Prerequisite: 3 hours History of Art.
Directed independent study of topics in the History of Art. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

HON - Honors Courses

HON 202 Inquiry, Discovery, and Literature 3.
Prerequisite: HON student.
A study of works of literature that treats the themes of inquiry and discovery--its risks, its creativeness, its ambiguities and complexities, and its moral dilemmas--through selected works from literature and other media, including theater, music, visual arts, and film. Analysis of each work in terms of its historical context and internal structure as well as its treatment of the nature of inquiry and discovery.

HON 290 Honors Special Topics - History 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in History, interdisciplinary in character and often team-taught.

HON 291 Honors Special Topics - Mathematics 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in mathematics, interdisciplinary in character and often team-taught.

HON 292 Honors Special Topics - Natural Sciences 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in the natural sciences, interdisciplinary in character and often team-taught.

HON 293 Honors Special Topics - Literature 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in history or literature, interdisciplinary in character, and often team-taught.

HON 294 Honors Special Topics - Philosophy or Religion 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in philosophy, religion, or arts, interdisciplinary in character, and often team-taught.

HON 295 Honors Special Topics - Social Science 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in the social sciences, interdisciplinary in character, and often team-taught.

HON 296 Honors Special Topics - Science, Technology, Society - H&SS Perspective 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in Science, Technology and Society (humanistic perspective) interdisciplinary in character and often team-taught.

HON 297 Honors Special Topics - Science, Technology, Society - Natural Sciences 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in Science, Technology and Society (natural science perspective) interdisciplinary in character and often team-taught.

HON 298 Honors Research/Independent Study 1-3.
Prerequisite: HON student.
Research/Independent Study for University Honors Program students. Repeatable if content differs. Research or independent study under supervision of faculty members. Project approval by the Honors Program Advisory Committee necessary prior to registration. Permission of the University Honors Program required. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

HON 299 Honors Special Topics - Visual and Performing Arts 3.
Prerequisite: HON student.
Seminar for University Honors Program students, repeatable if content varies, meeting GER requirements in Visual and Performing Arts, interdisciplinary in character and often team-taught.
HON 300 Race, Membership, and Eugenics 3.
R: University Honors Program Students; others by permission of the University Honors Program.
Theories of race are linked to eugenics, a belief and practice of improving the genetic quality of the human population drove much of American social policy in the early 20th century. The practice and science that supports it has historical roots in the US and in particular for poor people and people of color. This course will examine race, membership, and eugenics and the impact on American society, as well as explore the scientific and social trends that supported the movement. Course restricted to University Honors Program Students; others by permission of the UHP.

HON 310 The Creative Process in Science: Realities, Comparisons, and Culture Perceptions 3.
What is creativity in the context of the sciences? How does the creative process in science differ from and how is it similar to the creative process in other fields? This interdisciplinary perspectives course helps students to develop an understanding of scientific creativity through readings in history and philosophy of science, in the psychology of creativity, in original scientific papers, in biography and in memoirs. Student will analyze representations of scientific creativity in films and literature, conduct interviews with scientists, artists, musicians, and humanists, and analyze the social and institutional context of creativity.

HON 311 Words through Space and Time 3.
Cultures differentiate and frame events in various ways. At the heart of conceptual events are WORDS: an inventory of the ways a particular group of people depict and understand the interactions they have with each other and with the world around them. Through a detailed examination of lexical phenomena in cultures around the world, we will become familiar with the ways in which language and culture interact, the extent to which these surface in our everyday lives and the explanations proposed by various fields for their existence.

HON 341 Time Travel 3.
Prerequisite: HON student.
A study of contemporary metaphysics organized around the topic of time travel. David Lewis, perhaps the foremost contemporary metaphysician, argues that time travel is possible. His argument is based on ingenious positions about three central topics of metaphysics, personal-identity, causation, and free will. Students will consider each of these topics in some detail, always with an eye to their implications for time travel.

HON 344 Kantian Ethics 3.
In this course students will be introduced to foundations of morality by exploring one of the most significant moral theories in the history of philosophy, Kantian ethics. The course will focus on Kant's ideas about morality and discuss his proof of the fundamental principles of ethics. Students will be introduced to some of the enduring moral questions, such as What ought I to do? What can I hope? Are there universal moral principles and whether I ought to follow them? They will learn a variety of approaches to ethical issues and their reflection in social and political reality.

HON 345 On the Human 3.
Students in this seminar course actively explore human singularity: the properties, if any, that distinguish persons from animals and machines. Do we have souls? To what extent can we give physical explanations of our thoughts and actions? What, if anything, do scientific experiments tell us about our differences from chimps and artificial intelligences? What are the ethical implications of new biotechnologies? Should we be allowed to use genetic and neural engineering to change human nature? Students read articles, watch videos, stimulate class discussions with prepared questions, write short essays and a final paper, and participate in a 60-minute team presentation.

HON 347 Freedom and the Self 3.
R: University Honors Program Students; others by permission of the University Honors Program.
This course explores the complex and interrelated concepts of freedom and the self. The bulk of our time will be devoted to a close reading of several philosophical texts in which these concepts loom large. The course ends with a careful examination of three novels that, in various ways, take up the central themes of the class. Our intention in doing so is to reflect on the way that imaginative novelists treat these themes. This will enable us to ask broader and more interesting questions about freedom and selfhood.

What is the purpose of schooling? What role does it play in producing particular types of citizens and social structures? Theorists have imagined education as a space for democracy, as a way to cultivate identity, or as a method to train workers. All of these imaginaries attempt to understand interrelationship between the self, schooling, and the social order. This course will survey major social theories and, within the context of those theories, encounter texts which examine how schooling serves to maintain or subvert the social order. Course restricted to University Honors Program students; others by permission of the UHP.

HON 353 Code Breakers: Unlocking the Mysteries of One Human Language 3.
This course will introduce you to the architecture of one language. Students will work from scratch with a speaker of a language that none of us know, with the goal of unlocking the mysteries of that language at all levels - sound system, word formation, sentence structure, semantics and pragmatics. You will learn how to elicit field data through direct questioning and gathering of texts, how to organize field data, how to prepare entries in a field dictionary, and how to organize and write grammar. Course restricted to University Honors Program students; others by permission of the UHP.

HON 391 Music and Social Life 3.
At NC State and in the Triangle people are actively engaged in music-making, dancing, devotional practices, and a multitude of other kinds of artful performance. Students in this class think about the relationship between music and other aspects of social life by doing field research to answer questions about creativity, listening, performance, and the ways music and dance shape social life, values, and ideas about difference. Students consider modes of research about music and learn techniques for doing ethnographic research. Must be a University Honors Program student or have permission of the UHP.
HON 395 Honors Cooperative Education 3.
Prerequisite: Two semester full time in University Honors Program. Experimental work in government or industry for Honors Program students with two semesters completed in Honors. Typically students work 40 hrs/week with salary. Work supervisor, faculty adviser and Honors Program Director must sign HON 395 Honors Cooperative Ed contract. NC State cooperative Education requires paper work; student must pay fee rate for a 0-5 credit hour course. No other courses permitted along with HON 395. Student report of the independent project is required.

HON 397 Honors Extension and Engagement 1-6.
Prerequisite: One semester good standing in University Honors Program. Opportunity for significant hands-on involvement in extension and engagement research/project as mentored by NC County Extension employees often in cooperation with community employers/executives, local and government officials, and county citizens. Approved plan of work required with significant independent research/project including a reflective journal, a final paper and presentation at the NC State Undergraduate Research Symposium or a venue appropriate to the discipline, Students must provide their own transportation.

HON 398 Honors Special Topics 1-6.
Prerequisite: HON student. A seminar or other learning experience within an academic framework that may be on- or off-campus. Enables the development of new HON courses outside the GER list.

HON 496 Honors Capstone Seminar 3.
Prerequisite: HON student. Honors Seminars open to Juniors and Seniors in all disciplinary Honors Programs, and others with permission of the University Honors Program. Repeatable if content differs. A series of seminars with differing subjects, interdisciplinary in character and sometimes team-taught, allowing advanced students to explore topics from a multidisciplinary perspective and to apply their knowledge to issues and problems in the present world. Permission of the University Honors Program.

HON 498 Honors Research/Creative Project 1 3.
Prerequisite: One semester in good standing in University Honors Program, UHP student. Opportunity for hands-on faculty mentored research/creative project. Course may be stand-alone project completed in one semester/summer, or serve as part of a two semester project that is completed at the end of Honors Research/Creative Project 2 (HON 499). Approved plan of work required with significant independent research/creative project culminating with final paper and presentation at the NC State Undergraduate Research Symposium or other venues appropriate to the discipline, Research within or outside the student's discipline may fulfill experience. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

HON 499 Honors Research/Creative Project 2 3.
Prerequisite: One semester in good standing in University Honors Program, UHP student. Opportunity for hands-on faculty mentored research/creative project. Course serves as final part of a two-semester project that began with Honors Research/Creative Project 1 (HON 498) or approved disciplinary research experience. Approved plan of work required with significant independent research/creative project culminating with final paper and presentation at the NC State Undergraduate Research Symposium or other venues appropriate to the discipline. Research within or outside the student's discipline may fulfill experience. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Horticulture Science (HS)

HS - Horticulture Science Courses

HS 101 Introduction to Ornamentals and Landscape Technology 1.
Introduction to the collegiate experience, academic skills of successful students, and scope, purpose, and objectives of the Agricultural Institute with an emphasis on areas related to the ornamental and landscape plants industry. Students will explore college and departmental resources, academic policies and procedure, the green industry, career opportunities, and current trends and issues in horticulture.

HS 111 Plant ID 3.
Identification, adaptation, culture, and use of ornamental trees, shrubs, vines, ground covers and herbaceous plants.

HS 115 Plant Growth and Development 3.
Examination of how plants grow and respond to environmental and cultural stimuli. Topics include: cell growth; flower, fruit, seed, shoot, and root development and functions; anatomy of stems, roots and leaves; hormonal regulation of growth; adaptations for survival; plant responses to temperature, light and gravity; photosynthesis, transpiration, and absorption of water and nutrients.

HS 121 Plant Propagation 3.
Principles and practices involved in sexual (seed) and asexual (vegetative) propagation of a variety of plants. Methods of asexual propagation include cuttings, layering, budding and grafting, division, separation, and micropropagation (tissue culture). Emphasis on factors affecting the regeneration of species by particular techniques.

HS 131 Fruit & Vegetable Production 3.
The objective of this course is to give students a fundamental and practical understanding of small-scale fruit & vegetable production in North Carolina. Agricultural Institute students only.

HS 141 Greenhouse Crop Production 4.
Production of greenhouse crops. Emphasis on greenhouse construction and environmental manipulation of crop growth. Site selection, construction materials, greenhouse design. Specific flowering crops as models to demonstrate potted flowering plant, cut flower, and bedding plant production systems. Hands-on crop production experience plus trips to commercial floriculture production and marketing facilities.

HS 144 Weeds & Diseases of Ornamentals 3.
The objective of this course is to give students a fundamental and practical understanding of weed, disease, and pest management in the ornamental industries in North Carolina. Agricultural Institute students only.

HS 144 Weeds & Diseases of Ornamentals 3.
The objective of this course is to give students a fundamental and practical understanding of weed, disease, and pest management in the ornamental industries in North Carolina. Agricultural Institute students only.
HS 151 Nursery Production 3.
Total aspects of field and container nursery stock production including site selection and development, propagation, growing procedures, harvesting, marketing, shipping and labor management practices.

HS 162 Landscape Maintenance 3.
A study of the maintenance of landscaped areas including plant material selection, installation, pruning, fertilization, and pest control of trees, shrubs, lawns, flower beds, and interior plants.

HS 171 Landscape Construction 3.
This course will provide students a fundamental and practical understanding of landscape construction techniques and equipment. AGI students only.

HS 200 Home Horticulture 3.
Introduction and review of home horticulture as it relates to the horticultural enthusiast. A general understanding of plant growth, structure, and development; house plant selection and care, selecting trees, shrubs, and flowers for the home landscape, and other related topics.

Principles of plant growth and development relating to production and utilization of fruit, vegetable, floricultural, and ornamental crops. Historical, economic, and global importance of horticultural crops and services.

HS 202 Power of Plants: Appreciation and Use 3.
Power of Plants will focus on how plants are names and can be used in different horticultural situations and growing environments. Uniqueness, use, and plant descriptions of a wide range of horticultural plants will be considered including bonsai, topiary, espalier, and rain gardens. Not for horticultural science majors (SH, THG, THL).

HS 203 Home Plant Propagation 3.
Not for Horticultural Science Majors (SH, THG, THL). Substitution of HS 203 for HS 301 are not allowed. An introduction to the basic principles of sexual and asexual plant propagation, including seeds, cuttings, layering, Grafting, and Division.

HS 204 Home Landscape Maintenance 3.
Prerequisite: HS 200 or HS 201.
An understanding of the basic principles of landscape maintenance including, but not limited to, soil fertility and management, tree biology, pruning, turfgrass maintenance, plant selection, irrigation management and waterwise gardening, integrated pest management, and hardscape construction. Not for Horticultural Science majors (SH, THG, THL).

HS 205 Home Food Production 3.
Home food production will play an important role in increasing the sustainability of the world’s food systems for the foreseeable future. The goal of this course is to familiarize students with the scientific knowledge and tried-and-true practices needed to successfully produce food at home, even in small-scale environments such as decks and patios. On-campus students will be required to participate in two Saturday field trips to visit local home gardens. Distance education students will be required to visit two home gardens in their area. Not for Horticultural Science Majors (SH, THG, THL).

HS 215 Agricultural Genetics 3.
Prerequisite: ZO 160 or BIO 183.
Basic principles of inheritance in plants and animals of agricultural significance. Transmission genetics and its effects on the usefulness of plants and animals. Basic principles of plant and animal improvement.

HS 242 Introduction to Small Scale Landscape Design 3.
Landscape Horticulture is concerned with the small-scale design and use of plants and other materials to help humans relate better to the land. In this course, we will pursue an understanding of this relationship and explore the social, environmental, and economic implications of landscape design and the processes by which this understanding can be employed to design residential landscapes. There are an infinite number of design possibilities for each project, so it’s a designer’s responsibility and challenge to develop a creative and functional design that accommodates the needs of the users and is appropriate for a specific site.

HS 250 Home Landscape Design: Creating Garden Spaces 3.
Home landscape design is a 3-credit hour course for non-landscape design majors. Students will be introduced to the various issues associated with landscape design at the residential level. Through a series of Power Point lectures, on-line discussions, and small projects/ exercises, students will gain an understanding of landscape graphics. Skills in design, and develop landscape plans and other forms of landscape graphics. Students will use all of their learned skills to develop a design for a given site using provided design software.

HS 252 Landscape Graphic Communication 2.
Prerequisite: Horticultural Science Majors.
This class is an introduction to the basic graphic skills necessary to develop and communicate creative ideas in landscape design. In the design process, we use graphic skills to communicate our ideas, starting with analysis, moving on to concept, then to design development, and finally to illustrative renderings. The design process will be introduced and serve as a backdrop for incrementally introducing graphic skills. The class will become confident in the use of manual drawing skills, and will be introduced to the use of computer drafting skills. Graphics supplies, with an estimated expense of $120.00, are required for the course.

HS 280 Hands-On-Horticulture 3.
This course will provide students a fundamental and practical understanding of applied techniques in horticulture. Students will learn basic hardscape construction, basic wooden landscape structure construction, vegetable harvest, propagation of perennial plants, principles of irrigation installation, safe and efficient use of landscape equipment including arboriculture, and professional certification and licensing. Pesticide Licensing Fee of $75 required.

HS 290 Horticulture: Careers and Opportunities 3.
Introduction and orientation to programs in horticultural science. Discussion of current status of horticulture, extension and research. Emphasis on undergraduate program management, internships, graduate education, and career planning. Guest lectures, career opportunities and qualifications for employment in horticulture and related fields.

HS 301 Plant Propagation 4.
Prerequisite: BIO 181 or BO 200.
Theoretical basis and techniques for successful asexual and sexual propagation of seed plants and ferns. Influence of heredity, phytopathological infection, and environmental conditions on success and quality of propagules. Recent developments and innovations in propagation techniques and methodologies.

HS 302 Gardening with Herbaceous Perennials 3.
Prerequisite: BIO 183 or BO 200.
Examination of the use of herbaceous perennials in the home garden and commercial landscapes. Topics include: general plant characteristics, culture and management, garden attributes, design usage, horticultural history, propagation, use of exotic (nonnative)species in the garden, heirloom roses and ornamental grasses.
HS 303 Ornamental Plant Identification I 3.
Prerequisite: BIO 181.
Identification, distribution, growth, characteristics, adaptation, and usage of ornamental plants. Emphasizes bedding plants, trees, and gymnosperms.

HS 304 Ornamental Plant Identification II 3.
Prerequisite: BIO 181.
Identification, distribution, growth, characteristics, adaptation, and usage of ornamental plants. Emphasizes shrubs, ground covers, vines, bulbs, and interior landscape plants.

HS 357 Site Design and Construction Materials 4.
Prerequisite: Landscape Horticulture (11HORTTHL) students, HS 252 and HS 342.
Site design of small scale landscape design projects including: understanding two-dimensional and three-dimensional representation of landform, landform manipulation, surveying and measuring, base map development, site analysis, grading and drainage plans, small circulation systems (pedestrian and vehicular), pavement, functional role of plants, designing site structures (steps, ramps, walls, and fences), documenting and analyzing user information, and special population site requirements. Exploration of appropriate construction materials and their properties occurs concurrently with the above topics. Field trips will be required.

HS 400 Residential Landscaping 6.
Prerequisite: HS 211, 212, 342, LAR 430, Corequisite: LAR 457.
Equips students with the necessary skills to create functional, aesthetic, and humanistic designs for residential and other small scale projects. Aspects of problem identification, project organization, design, execution, and evaluation. Required field trip with fee.

HS 401 Landscape Construction Studio 6.
Prerequisite: THL Majors, HS 357, 400.
Small scale landscape design with a concentrated focus on detail design and construction documentation. Development of skills in designing, drawing, and building landscape features. Opportunities for hands-on experiences.

HS 411 Nursery Management 3.
Prerequisite: BIO 181, SSC 200, Junior standing.
Principles and practices of production, management, and marketing of field-grown and container-grown nursery plants. One of three scheduled weekend field trips required at students’ expense.

HS 416 Planting Design 4.
Prerequisite: Landscape Horticulture (11HORTTHL) concentration, HS 400.
Developing and cultivating a design process for creating meaningful and compelling ornamental planting designs through the study and practice of spatial articulation (form, enclosure, permeability), physical properties of plants (line, form, texture, color), client/site analysis and program development, visual journaling, garden narrative, presentation skills, utilizing principles of visual composition, design communication, and understanding and resolving technical and horticultural issues in contemporary planting design.

HS 418 Digital Media Graphic for Landscape Designers 3.
Prerequisite: HS 242 and HS 400.
Digital media is used in the landscape design profession as a tool with analytic, expressive, and representational abilities. The course focuses on introducing landscape design students to digital representational tools used to communicate design ideas for small scale landscape design projects. Students will be introduced to techniques used in AutoCAD, Photoshop, Illustrator, InDesign, and Sketch Up modeling programs. Digital representation will be used to develop the variety of images necessary to explore and communicate design intentions. Materials for this course will cost approximately $50.

HS 421 Temperate-Zone Tree Fruits: Physiology and Culture 3.
Prerequisite: BIO 181 or 80 200.
Physiology and culture of the major temperate-zone tree fruit and nut crops of the United States. Fundamental principles underlying woody plant growth as applied to the culture of specific tree-fruit crops with emphasis on crops of commercial importance to North Carolina.

HS 422 Small Fruit Production 3.
Prerequisite: BIO 181, SSC 200, HS 201.
Importance and economic value of blackberries, blueberries, cranberries, grapes, raspberries, strawberries and minor small fruit crops in the agricultural economy of the USA and the world. Cultural requirements of these crops and manipulation of their known morphological and physiological traits for successful production. Six all afternoon field trips are required.

HS 423 Viticulture 3.
Prerequisite: Junior standing or Senior standing.
A presentation of the commercial importance, distribution, anatomy, physiology, and production of Genus Vitis (grapes) including cultivars, propagation, canopy management, diseases, weed control, physiology, anatomy, irrigation, wine production, climates and soils. This course will not require students to provide their own transportation. Non-scheduled class time for field trips or out-of-class activities IS required for this class.

HS 428 Service-Learning in Urban Agriculture Systems 1.
Prerequisite: SSC 200 or equivalent, BIO 181 or 183, and CH 101.
Course provides students a hands-on experience in urban agriculture with under-served youth in the Raleigh area. Students partner with a community gardening organization to provide knowledge and experience in soil science and agriculture to youth with the goals of increasing urban food security and developing student leadership skills. Particular emphasis is places on reflecting on course activities and deepening of skills related to extension, outreach, and working with diverse populations. Course designed to be taken as a companion course to SSC 427, however can be taken as a stand-alone course.

HS 431 Vegetable Production 4.
Prerequisite: BIO 181, SSC 200.
Principles and practices of production and marketing of seventeen vegetable crops grown in the U.S. Additional topics include pest management, seed technology, food safety, sustainable agriculture, use of genetically engineered crops, and consumer issues.
HS 432 Introduction to Permaculture 3.
Permaculture means "permanent culture," and "is the conscious design and maintenance of cultivated ecosystems that have the diversity, stability, and resilience of a natural ecosystem." (Bill Mollison) This course will explore a design/thinking methodology that seeks to provide our essential physical needs, food, water, shelter, energy, etc., while doing so in an environmentally friendly, sustainable manner. The three weekend field trips are required. This course is restricted to upper level undergraduate, graduate, or matriculated continuing education students. STUDENTS MAY NOT RECEIVE CREDIT FOR BOTH HS 432 AND HS 532.

HS 440 Greenhouse Management 3.
Prerequisite: SSC 200 and HS 201.
Perspective of greenhouse systems management. Selection of greenhouse site, construction, heating, cooling and production systems. Emphasis on greenhouse operations, cost accounting and analysis. Other topics: root substrates, sanitation, water, fertilization, chemical growth regulation, temperature, light and marketing. Hands-on experience in greenhouse operations plus trips to commercial greenhouses and markets.

HS 442 Floriculture Crop Production 3.
Prerequisite: SSC 200, HS 201.
Production of floricultural crops. Emphasis on environmental manipulation and scheduling of crop growth and development for targeted market periods. Specific flowering crops as models to demonstrate potted flowering plant, cut flower, and bedding plant production systems. Hands-on crop production experience plus field trips to commercial floriculture production and marketing facilities.

HS 451 Plant Nutrition 3.
Prerequisite: SSC 200.
An understanding of the basic mineral nutrient requirements, nutritional monitoring procedures, and fertilizer application methods in horticultural production systems including those for fruits, field vegetables, fruits and vegetables under plasticiculture, nursery crops, landscapes, greenhouse flowers and vegetables, interior plantscapes, hydroponics, and organic farming.

HS 462 Postharvest Physiology 3.
Prerequisite: PB 421.
Preharvest and postharvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve postharvest quality and extend storage life of fruits, vegetables and ornamentals.

HS 471 Tree and Grounds Maintenance 4.
Prerequisite: SSC 200.
Principles and practices of tree and grounds maintenance. Physical (water) and chemical (fertility) properties of urban soils. Tree and shrubbery: physiology, selection, transplanting, pruning, fertilization, and protection. Weed biology and nonchemical and chemical management options.

HS 492 Horticulture Internship 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

HS 493 Independent Study in Horticultural Science 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

HS 495 Experimental Courses in Horticultural Science 1-6.
Independent study under faculty supervision of horticultural topics in the student's area of interest not available in regular course offerings. Offering of new courses on a trial basis.

HS 502 Plant Disease: Methods & Diagnosis 2.
Prerequisite: PP 315.
Introduction to the basic principles of disease causality in plants and the methodology for the study and diagnosis of plant diseases caused by fungi. Identification of plant-pathogenic fungi. Research project, disease profiles and field trips are required.

HS 516 Planting Design 4.
P: HS 400.
Developing and cultivating a design process for creating meaningful and compelling ornamental planting designs through the study and practice of spatial articulation (form, enclosure, permeability), physical properties of plants (line, form, texture, color), client/site analysis and program development, visual journaling, garden narrative, presentation skills, utilizing principles of visual composition, design communication, and understanding and resolving technical and horticultural issues in contemporary planting design.

HS 521 Temperate-Zone Tree Fruits: Physiology and Culture 3.
Prerequisite: Sophomore standing.
Physiology and culture of the major temperate-zone tree fruit and nut crops of the United States. Fundamental principles underlying woody plant growth as applied to the culture of specific tree-fruit crops with emphasis on crops of commercial importance to North Carolina.

HS 523 Viticulture 3.
Prerequisite: BS Horticulture/Plant Science or permission from the instructor.
A presentation of the commercial importance, distribution, anatomy, physiology, and production of Genus Vitis (grapes) including cultivars, propagation, canopy management, diseases, weed control, physiology, anatomy, irrigation, wine production, climates and soils. This course will not require students to provide their own transportation. Non-scheduled class time for field trips or out-of-class activities is required for this class. One Saturday field-trip will be scheduled. Students may not receive credit for both HS 423 and HS 523.
HS 532 Introduction to Permaculture 3.
Permaculture means "permanent culture," and..."is the conscious design and maintenance of cultivated ecosystems that have the diversity, stability, and resilience of a natural ecosystem." (Bill Mollison) This course will explore a design/thinking methodology that seeks to provide our essential physical needs, food, water, shelter, energy, etc., while doing so in an environmentally friendly, sustainable manner. The three weekend field trips are required. This course is restricted to upper level undergraduate, graduate, or matriculated continuing education students. STUDENTS MAY NOT RECEIVE CREDIT FOR BOTH HS 432 AND HS 532.

HS 533 Public Garden Administration 3.
This course addresses the practices, programs, and professional skills that are critical to the successful management of public gardens. The aim of the course is to better prepare graduate students and upper-level undergraduates for potential careers in public garden administration. Topics will include a brief history, impact, and current trends of public gardens in the United States; plant collections; managing staff, volunteers, and boards, and the visiting public; finances and fund raising; educational programming; visitor services; and careers in public gardens. Two Saturday off-campus field trips are required.

HS 541 Plant Breeding Methods 3.
Prerequisite: ST 511, Corequisite: ST 512
Overview of plant breeding methods for advanced undergraduate and beginning graduate students. Covers principles and concepts of inheritance, germplasm resources, pollen control, measurement of genetic variances, and heterosis. Special topics include heritability, genotype-environment interaction, disease resistance, and polyploidy. In-depth coverage on methods for breeding cross-pollinated and self-pollinated crops. Prepares students for advanced plant breeding courses.

HS 550 Environmental Nursery Production 3.
Prerequisite: HS 411, Nursery Management, or an equivalent course.
The course focuses on the impacts of the nursery industry on the environment and environmentally sound nursery practices. Exploration of the major challenges facing the nursery industry that drive decision making during production. Evaluation of past and current research addressing these challenges and sampling procedures and interpretation will be learned. Graduate status and an undergraduate nursery production or management course or working knowledge of nursery production required.

HS 551 Plant Nutrition 3.
Prerequisite: SSC 200.
An understanding of the basic mineral nutrient requirements, nutritional monitoring procedures, and fertilizer application methods in horticultural production systems including those for fruits, field vegetables, fruits and vegetables under plasticulture, nursery crops, landscapes, greenhouse flowers and vegetables, interior plantscapes, hydroponics, and organic farming.

HS 562 Postharvest Physiology 3.
Pre- and post-harvest factors that affect market quality of horticultural commodities with an emphasis on technologies to preserve quality and extend storage life of crops.

HS 583 Advanced Floral Crop Production and Handling 3.
Principles and commercial practices for producing floral potted crops and cut flowers emphasizing the physical responses of plants to their environment and post-harvest physiology. Lab will be conducted at the student's home location and students will document plant growth with photos or video. Some live plants will be mailed to the student; however, the student will be required to purchase some plants (e.g. African violet). Course is restricted to graduates students only.

HS 590 Special Problems in Horticultural Science 1-6.

HS 601 Professional Presentation Skills in Horticultural Science 2.
The purpose of this course is to familiarize the students with the professional presentation skills they need to be successful. These skills include speaking, writing, poster and website development, based on the student's proposed research/project and literature review.

HS 610 Special Topics in Horticultural Science 1-6.
Investigation of special theoretical problems at 600 level in horticultural science not related to a thesis problem; new 600-level courses during developmental phase.

HS 615 Advanced Special Topics 1-6.
Investigation of theoretical problems at the 600 level in horticultural science not related to a thesis problem; new 600-level courses during the development phase.

HS 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

HS 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

HS 689 Non-Thesis Masters Continuous Registration - Half Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

HS 690 Special Problems in Horticultural Science 1-9.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

HS 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.
HS 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

HS 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
Original research on specific problems in fruit, vegetable and ornamental crops.

HS 701 Plant Metabolism 1.
Prerequisite: (CH 223 or CH 227) and PB 421.
A brief introduction to various aspects of metabolism in plants including the basic biochemical processes including the syntheses, utilization and roles of amino acids, lipids, carbohydrates and secondary metabolites in plant growth, development and response to the environment. This course is taught as a 5-week mini course.

HS 702 Biology of Plant Hormones 1.
Prerequisite: BO 421, (GN 411 or BCH 451).
Recent developments and current literature on the physiology, biochemistry, molecular biology, and practical applications of the primary plant hormones. The biosynthesis, signal transduction pathways, and biological functions of specific plant hormones will be examined. Taught as a five-week minicourse.

HS 703 Breeding Asexually Propagated Crops 1.
Prerequisite: CS 413.
Principles and problems associated with breeding clonally propagated crops and techniques used in overcoming these problems. Taught third five weeks of semester. Drop date is by last day of 3rd week of minicourse.

HS 704 Plant Nomenclature 1.
Prerequisite: PB 421.
A practical foundation in plant nomenclature and nomenclatural references. Emphasis on the evolution of international rules for naming plant taxa and their application in both wild and cultivated plants. Nomenclature applications used in patents, cultivar releases and journal articles. Taught mid-semester. Taught five weeks of semester.

HS 705 Physiology Of Flowering 1.
Prerequisite: PB 421.
Examination of physiological basis of flowering in plants such as: floral initiation, transition to reproductive growth; floral development; plant response to light, temperature, nutrition, water supply; plant age; chemical growth regulation and in vitro flowering. Taught first five weeks of fall semester. Drop date is by last day of 3rd week of minicourse.

HS 706 Fruit Development and Postharvest Physiology 1.
Prerequisite: PB 421.
Theories of plant senescence, both physiological and biochemical, and postharvest changes in all types of plant parts. Emphasis on physiological principles underlying current postharvest handling and storage techniques. A study of fruit development from fruit set to senescence. Taught third five weeks of semester. Drop date is by last day of 3rd week of minicourse.

HS 707 Environmental Stress Physiology 1.
Prerequisite: PB 421.
Physiology of plant responses to environmental stresses, with emphasis on current research in selected physiological, molecular, and biochemical mechanisms for tolerance to environmental stresses such as temperature extremes, drought, salt, pathogens and other plants.

HS 717 Weed Management Systems 1.
Prerequisite: CS 414.
Weed management systems including integration of cultural, biological, mechanical and chemical methods for vegetables, fruits, ornamentals, turf, small grains, corn, tobacco, cotton, peanuts, aquatic and non-cropland settings. Taught second five weeks of semester. Drop date is by last day of 3rd week of minicourse.

HS 720 Molecular Biology In Plant Breeding 3.
Prerequisite: CS(GN, HS) 741.
Theory and principles of molecular biology applied to plant breeding. Experimental approaches to induce genetic change, cytoplasmic recombination, haploid utilization and potentials of molecular techniques for solving breeding problems.

HS 725 Pesticide Chemistry 1.
Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225).
Chemical properties of pesticides including hydration and solvation, ionization, volatilization, lipophilicity, molecular structure and size, and reactivity and classification according to chemical description, mode of action or ionizability. Taught during the first 5 weeks of semester. Drop date is last day of 3rd week of the minicourse.

HS 727 Pesticide Behavior and Fate In the Environment 2.
Prerequisite: CS(HS, SSC, TOX)725, SSC 200.
Sorption/desorption, soil reactivity, movement, volatilization, bioavailability, degradation and stability of pesticides in the environment. Taught during the last 10 weeks of semester. Drop date is last day of 3rd week of the minicourse.

HS 729 Herbicide Behavior In Plants 2.
Prerequisite: BO 751 and BO 752 and CS(HS, SSC) 725.
Chemical, physiological and biochemical actions of herbicides in plants including uptake, translocation, metabolism and mechanism of action.

HS 745 Quantitative Genetics In Plant Breeding 1.
Prerequisite: CS(GN, HS) 741, ST 512, course in quantitative genetics recommended.
Theory and principles of plant quantitative genetics. Experimental approaches of relationships between type and source of genetic variability, concepts of inbreeding, estimations of genetic variance and selection theory.

HS 746 Breeding Methods 2.
Prerequisite: CS (GN, HS) 741, ST 512.
Theory and principles of plant breeding methodology including population improvement, selection procedures, genotypic evaluation, cultivar development and breeding strategies.

HS 790 Special Problems in Horticultural Science 1-6.

HS 815 Advanced Special Topics 1-6.
Investigation of theoretical problems at 600 level in horticultural science not related to a thesis problem; new 600-level courses during development phase.

HS 860 Plant Breeding Laboratory 1.
Prerequisite: CS(GN, HS)741.
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.
HS 861 Plant Breeding Laboratory 1.
Prerequisite: CS(GN,HS)/741.
Visitation of plant breeding projects in the Depts. of CS and HS at NC State, along with commercial seed companies. Discussion and viewing of breeding objectives, methods and equipment and teaching and practice of hybridization methods.

HS 885 Doctoral Supervised Teaching 1-3.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

HS 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

HS 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Humanities and Social Sciences (HSS)

HSS - Humanites and Social Sciences Courses

HSS 120 Introduction to Humanities & Social Sciences 2.
Prerequisite: New Freshmen with majors in the College of Humanities and Social Sciences Only.
Introduction to Humanities and Social Science disciplines by providing comparative disciplinary perspectives on a topic that is studied by CHASS faculty in different disciplines. The course will also facilitate exploration of CHASS and University resources, policies and procedures, and address skills for academic, personal, and career success. First-year entering CHASS majors only.

HSS 392 International and Crosscultural Communication 3.
Prerequisite: New Freshmen with majors in the College of Humanities and Social Sciences Only.
Patterns and problems of verbal and non-verbal forms of crosscultural communication. Avoidance and management of cultural conflict arising from awareness of characteristics and crosscultural communication. Impact on communication of differing cultural perspectives.

Humanities (HUM)

HUM - HUM Courses

HUM 295 Humanities Special Topics 3.
Prerequisite: Doctoral student.
Special topics course offering for the general education Humanities category.

Humanities and Global Knowledge (HUMG)

HUMG - HUMG Courses

HUMG 295 Humanities and Global Knowledge Special Topics 3.
Prerequisite: Doctoral student.
Special topics course offering for the general education Humanities and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Humanities (HUM) requirement.

Humanities and U.S. Diversity (HUMU)

HUMU - HUMU Courses

HUMU 295 Humanities and U.S. Diversity Special Topics 3.
Prerequisite: Doctoral student.
Special topics course offering for the general education Humanities and U.S. Diversity categories. This course may be used for the U.S Diversity (USD) co-requisite and/or for the Humanities (HUM) requirement.

Immunology (IMM)

IMM - Immunology Courses

IMM 595 Special Topics 1-6.
IMM 610 Special Topics 1-6.
IMM 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

IMM 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

IMM 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

IMM 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.
IMM 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment of the master’s degree and are writing and defending their theses.

IMM 705 Immunotoxicology 2.
Prerequisite: TOX 701.
Concepts in the study of adverse effects of chemicals on the immune system, including allergic responses, autoimmunity and immunosuppression. Significance of immunotoxic effects resulting from environmental or workplace exposure. Role of immunotoxicity in risk assessment.

IMM 751 Immunology 3.
Prerequisite: BCH 451, GN 411, MB 351.
Introduction to mechanisms of immunity in man and animals. Emphasis on interactions between cells of the immune system in production of immune responses and the molecules in control of these interactions.

IMM 755 Immunoparasitology 2.
Prerequisite: MB 751.
Helminth and protozoal parasite immune evasion and immunomodulation; consequences of parasite-induced immunopathogenesis; learning from failed attempts to develop protective vaccines against protozoa and helminths.

IMM 757 Comparative Immunology 3.
Prerequisite: MB 751 or MB 441 or BIO 414.
Compare and contrast the immune system structure and function of animal species of agricultural and veterinary significance with that of humans and traditional biomedical model organisms. Discuss key evolutionary differences, how different species use different mechanisms to achieve the same outcomes, and the clinical implications for these differences.

IMM 783 Advanced Immunology 3.
Prerequisite: MB (IMM) 751.
In depth study of the basic cellular and molecular mechanisms of immunity, including antigen processing and presentation, T cell development, initiation of the immune response, effector mechanisms, and immunological memory. The course is designed for advanced graduate students who wish to focus on the current concepts in immunology.

IMM 795 Special Topics 1-6.

IMM 807 Seminar in Veterinary Microbiology/Immunology 1.
Presentation of ongoing research and current topics in microbiology.

IMM 810 Special Topics 1-6.

IMM 816 Advanced Topics in Immunology 1.
Selected topics of current interest in immunology. A different topic will be covered each semester to focus on the most recent developments in the field.

IMM 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

IMM 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

IMM 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Industrial Design (ID)

ID - Industrial Design Courses

ID 201 Basic Industrial Design Studio I 6.
Prerequisite: D104 and D105; Corequisite: ID 215, ID 255, and ID 318.
Introduction to the theories, methods, and language of industrial design; elementary problems in form and function; transitional implications of hand-crafted and mass-produced objects, in various materials. Industrial Design majors, department approved minor, and department approved elective (“swing”) studio for all other College of Design majors.

ID 202 Basic Industrial Design Studio II 6.
Prerequisite: ID 201, ID 215, ID 255, ID 318; Corequisite: ID 315, ID 418.
Introduction to the fundamentals of product development and design with emphasis on analytical and intuitive approaches to problem solving, technical skills, manufacturing and structural considerations in design of simple products/systems.

ID 215 Introduction to digital Techniques 3.
Prerequisite: D 104, D 105.
Introduction to the computer as a design tool for generating and manipulation of two-dimensional raster and vector imagery; techniques in two-dimensional concept rendering; desktop publishing applications for design and production of presentation documentation; and visual editors for creating and managing web sites. Industrial design majors, department approved minor, and department approved elective for all other college of design majors.

ID 255 Contemporary Manufacturing Processes I 3.
Prerequisite: D 104, D 105.
Introduction to mass production processes and their influences on design. Wood, paper and metal manufacturing processes utilized in quantity production. Emphasis on materials comparison and process selection in relation to product function, form, safety, human factors and manufacturability. Field trips required. Industrial Design majors, department approved minor, and department approved elective for all other College of Design majors.
ID 256 Contemporary Manufacturing Processes II 3.
Prerequisite: ID 255.
Second course in mass production processes and their influences on design. Emphasis on material search and process selection in relation to form, function, human factors, finishes, and joining methods. Plastics and rubber and their specific manufacturing processes utilized in mass production. Industrial Design Majors and Department approved Elective for all other College of Design Majors.

ID 262 Professional Practice in Industrial Design 3.
Issues and situations encountered in a design practice. Topics include patents, trademarks, contracts, basic marketing skills within corporations and in free-lance design.

ID 292 Special Topics in Industrial Design 1-3.
Topics of current interest in Industrial Design. Normally used to develop new courses.

Prerequisite: ID 202, ID 255, ID 315, ID 418; Corequisite: ID 415 (Fall), ID 445 (Spring).
Individual and team-oriented design experiences that expand upon and combine intellectual and manual skills required for the practice of industrial design. Emphasis on identifying and solving design problems through manipulation of design theory, application of human factors, product safety awareness, universal design principles, ecological/environmental concerns, appropriate combination of materials and manufacturing techniques, and presentation of concepts. Extensive integration of computer-technology, including 3-D digital modeling, rapid prototyping, interactive virtual product visualization, and world wide web-based presentation.

ID 315 Digital Product Modeling 3.
Prerequisite: ID 215.
Progression of digital experiences that expand upon and combine the intellectual and conceptual skills required for 3-dimensional design visualization. Emphasis on solving design problems through development and manipulation of 3-dimensional form within the virtual environment.

ID 318 Ideation I 3.
Prerequisite: D 104, D 105.
The ideation process of conceiving, developing and recording ideas two-dimensionally. These techniques defined and practiced as an extension of understanding the human idea motor process.

ID 400 Advanced Industrial Design Studio Series 6.
Prerequisite: ID 255, ID 300, ID 315, ID 418, ID 445.
A series of advanced studio experiences that expands upon and combines intellectual and manual skills required for the practice of industrial design. Emphasis on identifying and solving design problems through manipulation of design theory, application of human factors, product safety awareness, appropriate combination of materials and manufacturing techniques, and presentation of concepts.

ID 415 Advanced Digital Product Modeling 3.
Prerequisite: ID 315.
Advanced concepts for planning and executing efficient workflow practices for manufacturable product surfaces. Emphasis on theory and application of three-dimensional surface modeling tools, accurate development of wire frame geometry, rapid prototyping and animation techniques. Introduction of animations to aid with dynamic visual analysis of digital product design concepts.

ID 418 Ideation II 3.
Prerequisite: ID 318.
This is an advanced course which expands the ideation process with greater emphasis directed toward the creative development and recording of conceptual design phase.

ID 444 History of Industrial Design 3.
The history of industrial design examines the field of industrial design in relationship to developments in engineering, applied and theoretical sciences, and developments in aesthetic theories. It covers the periods from the early enlightenment (1700s) through present day issues. Students will examine such relationships in detail in three short presentations and a comprehensive term paper. As a four-hundred level course, students are expected to be able to work independently and expand their knowledge well beyond lectures and readings.

ID 445 Human-Centered Design 3.
Junior standing or above.
Introduction to the spectrum of human physical and cognitive capabilities as they relate to user interaction with designed products and environments. Industrial Design Majors and Department approved Elective for all other College of Design Majors with Junior or Graduate standing in Major.

ID 490 Industrial Design International Studio 6.
Prerequisite: Junior standing in Major. Approval of Study Abroad Office. Define industrial design problems and develop design solutions in an international setting. Studio projects related to design, culture, and traditional and contemporary limited and mass produced products. Focus on artifact making through directed studies. Industrial Design Majors, and Department approved Elective ("swing") Studio for all other College of Design Majors with Junior or Graduate standing in Major.

ID 492 Special Topics in Industrial Design 1-3.
Junior standing or above.
Topics of current interest in Industrial Design. Normally used to develop new courses. Industrial Design Majors, and Department approved Elective for all other College of Design Majors with Junior or Graduate standing in Major.

ID 494 Internship in Industrial Design 1-6.
Prerequisite: Junior standing, 3.0 GPA or better.
Supervised field experience in product design offices, galleries, museums and other related organizations. Maximum of 6 credit hours. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

ID 495 Independent Study in Industrial Design 1-3.
Prerequisite: Junior standing in Industrial Design and 3.0 GPA or better.
Special projects in industrial design developed under the direction of a faculty member on a tutorial basis. Maximum 6 credit hours - May be repeated. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ID 500 Advanced Industrial Design (Series) 6.
Prerequisite: Portfolio review.
Advanced studies in industrial design. Special emphasis given to problem identification, program formulation and application of advanced design methods. All problems of an individual nature leading to a synthesis of previous design experience.
ID 511 Industrial Design Materials and Processes I 3.
Prerequisite: Graduate standing.
Analysis of paper, wood, metal and manufacturing processes utilized in production of mass-produced products. Advanced studies in mass production processes and their influence on design and development of products. Emphasis on material search and process selection in relation to product safety, cost, function, human factors, form, finishes and joining methods.

ID 512 Industrial Design Materials and Processes II 3.
Prerequisite: Graduate standing.
Analysis of plastics and rubber and related manufacturing processes utilized in production of mass-produced products. Advanced studies in mass production processes and their influence on design and development of products. Emphasis on material search and process selection in relation to cost, product safety, function, human factors, form, finishes and joining methods.

ID 581 Industrial Design Project Preparation 3.
Prerequisite: Graduate standing.
A seminar course designed to assist students in preparing groundwork for the final project to be conducted in design studio.

ID 582 Special Topics In Industrial Design 1-6.
Prerequisite: Graduate standing.
F.S. Topics of current interest to program/option offered by faculty in the School. Subjects offered under this number normally used to test and develop new courses.

ID 588 Final Project Studio In Industrial Design 6.
Prerequisite: ID 581.
Final project for graduate students supervised by members of their graduate advisory committees.

ID 630 Independent Study In Industrial Design 1-3.
Prerequisite: Graduate standing.
Special problems in various aspects of industrial design developed under the direction of faculty member on a tutorial basis.

ID 676 Special Project 1-3.
Prerequisite: Graduate standing.
Seminars on subjects of current interest in industrial design which are presented by persons not part of regular faculty.

ID 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ID 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time registration to complete incomplete grades, projects, final master's exam, etc.

ID 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

ID 690 Master’s Examination 1-9.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Industrial and Systems Engineering (ISE)

ISE - Industrial and Systems Engineering Courses

ISE 110 Computer-Based Modeling for Engineers 3.
Prerequisite: E 115, Corequisite: MA 141.
Introductory course in computer-based modeling and programming using Visual Basic for Applications. Emphasis on algorithm development and engineering problem solving. Methodical development of VBA within applications like Microsoft Excel and Access from specifications; documentation, style; control structures; classes and methods; data types and data abstraction; object-oriented programming and design; graphical user interface design. Projects: design problems from electrical, industrial, textile, and financial systems. Functional relationships will be given and programs will be designed and developed from a list of specifications.

Prerequisite: E115 and Corequisite: ISE216
This is an 8 week course. An introductory engineering graphics course which builds on the foundations of computer-aided 2D sketching and 3D modeling for industrial engineers. Students will develop and refine their ability to communicate designs via modeling techniques prolific in industry. The concurrent nature of ideation, engineering analysis and manufacturing will be emphasized as students review case studies and develop their own models. Constraint-based design will drive strategies that accurately reflect design intent and promote part family relationships and automation. Students will work in small teams to create a mechanism that must achieve certain functional criteria. ISE majors have priority registration for this course.

ISE 216 Product Development and Rapid Prototyping 3.
Corequisite: ISE 215.
Introduction to product development and prototyping. Team-based development of a new product during the semester. Specific topics are voice of the customer, product specification and parameter specification, Quality Function Deployment and the House of Quality, concept generation, concept selection, detailed design using SolidWorks, prototyping, design for assembly, design for the environment, and intellectual properties and patents. Team presentations of a functional prototype of their product at the end of the semester.

ISE 311 Engineering Economic Analysis 3.
Prerequisite: Grade of C or better in MA 141.
ISE 315 Introduction to Computer-Aided Manufacturing 3.
Prerequisite: ISE 215 and Co-requisite: ISE 316.
This is an 8 week course. Introduction to the principles of modern-day multi-axis machine tool control, using computer-aided manufacturing (CAM) software tools. Emphasis is placed on transferring part geometry from CAD to CAM, for the development of CNC-ready programs. Industry file formats, machining strategies, G & M-code generation, optimization and verification techniques will also be investigated. Upon successful completion of this course, students will be able to demonstrate proficiency in the use of industry-relevant CAD/CAM software and will be able to extend that knowledge to practice through exercises and projects. Use of CNC machine tools will be introduced and demonstrated in the department’s physical lab spaces. ISE majors have priority registration for this course.

ISE 316 Manufacturing Engineering I - Processes 3.
Prerequisite: MSE 200 and ISE 216; Co-requisite: ISE 315.
Analytical study and design of manufacturing engineering with emphasis on mfg. and processes. Addresses the interaction of design, materials, and processing. Laboratory instruction and hands-on experience in metrology, machining, process planning, economic justification, and current mfg. methodologies.

ISE 317 Introduction to Computer-Aided Manufacturing 3.
Prerequisite: ISE 315.
This is an 8 week course. Rapid applications development (RAD) tools to design and implement database-based applications. The SQL database query language, a standard RAD environment and how to access information in a database from it, use of Visual Basic for Applications, and how to integrate these tools together to design and build engineering applications. Examples will be from manufacturing and production systems.

ISE 318 Introduction to Simulation 3.
Prerequisite: MA 242, ST 372, C or better in ISE 110.
Discrete-event stochastic simulation for the modeling and analysis of systems. Programming of simulation models in a simulation language. Input data analysis, variance reduction techniques, validation and verification, and analysis of simulation output. Random number generators and random variate generation.

ISE 319 Project Work in Industrial Engineering 1-6.
Prerequisite: Junior standing.
Special investigations, study or research related to the field of industrial engineering. In a given semester several students and/or student groups may be working in widely divergent areas under the direction of several members of the faculty.
ISE 498 Senior Design Project 3.
Prerequisite: 3 of the following 5 (ISE 311, ISE 452, ISE 408, ISE 441, ISE 453).
Individual or group design projects requiring problem definition and analysis, synthesis, specification and presentation of a designed solution. Students work under faculty supervision either on actual industrial engineering problems posed by local industrial, service and governmental organization or on emerging research issues.

ISE 501 Introduction to Operations Research 3.
Prerequisite: MA 421 or ST 421 or ST 371 and ST 372.
OR Approach: modeling, constraints, objective and criterion. Problems of multiple criteria, optimization, model validation and systems design. OR Methodology: mathematical programming; optimum seeking; simulation, gaming; heuristic programming. Examples. OR Applications: theory of inventory; economic ordering under deterministic and stochastic demand. Production smoothing problem; linear and quadratic cost functions. Waiting line problems: single and multiple servers with Poisson input and output. Theory of games for two-person competitive situations. Project management through PERT-CPM.

ISE 505 Linear Programming 3.
Prerequisite: MA 405.
Introduction including: applications to economics and engineering; the simplex and interior-point methods; parametric programming and post-optimality analysis; duality matrix games, linear systems solvability theory and linear systems duality theory; polyhedral sets and cones, including their convexity and separation properties and dual representations; equilibrium prices, Lagrange multipliers, subgradients and sensitivity analysis.

ISE 510 Applied Engineering Economy 3.
Prerequisite: Undergrad. courses in engineering economics and ST.
Engineering economy analysis of alternative projects including tax and inflation aspects, sensitivity analysis, risk assessment, decision criteria. Emphasis on applications.

ISE 515 Manufacturing Process Engineering 3.
Manufacturing process engineering, primary, secondary, finishing and assembly processes. Traditional and non-traditional manufacturing processes, group technology, manufacturing analyses and application of economic analyses. Graduate standing in Engineering.

ISE 519 Database Applications in Industrial and Systems Engineering 3.
Prerequisite: ISE 110.
Rapid application development (RAD) tools to design and implement database-based applications. This includes: SQL query language, Visual Basic for Applications in database application construction, a standard RAD environment and how to access information in a database, entity/attribute modeling of the database structure, anomalies of database structures that create problems for applications, modeling of application system's functionality, and integrating these tools together to design and implement engineering applications. Examples from manufacturing and production systems. Restricted to advanced undergraduates and graduate students.

ISE 520 Healthcare Systems Performance Improvement I 3.
Prerequisite: ST 372, ISE 352, ISE 361, and ISE 441.
Methods used to improve the performance of health care delivery systems with emphasis on patient care cost, access, and quality. Adaptation of lean and six-sigma to rapid and continuous health care systems improvement through organizational and process transformation. Fundamentals of scheduling, staffing, and productivity in health systems employing simulation and optimization. Health care policy and management.

ISE 521 Healthcare Systems Performance Improvement II 3.
Prerequisite: ISE 520.
Continuation of ISE 520 with a concentration on the completion of a healthcare systems process improvement project at the sponsoring health care institution. Project must employ the tools and techniques of healthcare systems process improvement. The project is done in conjunction with a diverse and multi-disciplinary team from the healthcare institution. The student must serve as a facilitator and coach, resulting in a project with measured success. Success will be determined by the improvement in patient care as quantified in cost, quality, and access.

ISE 540 Human Factors In Systems Design 3.
Prerequisite: IE 452 or PSY 340, Corequisite: ST 507 or 515.
Introduction to problems of the systems development cycle, including human-machine function allocation, military specifications, display-control compatibility, the personnel sub-system concept and maintainability design. Detailed treatment given to people as information processing mechanisms.

ISE 541 Occupational Safety Engrg 3.

ISE 543 Musculoskeletal Mechanics 3.
Prerequisite: BIO 125 or BAE(BIO) 235 or Graduate standing.
Anatomy, physiology and biomechanics of musculoskeletal system including muscle bone, tendon, ligament, cartilage, nerve. Modeling of tissue and joints with special emphasis on spine and upper extremity. Physical, mathematical, optimization and finite element modeling techniques as applied in biomechanics research.

ISE 544 Occupational Biomechanics 3.
Prerequisite: Graduate standing.
ISE 546 Management Decision and Control Systems 3.
Prerequisite: CSC 423 or BUS 541.
Planning, design, and development and implementation of comprehensive computer-based information systems to support management decisions. Formal information systems principles; information requirements analysis; knowledge acquisition techniques; information modeling. Information resource management for quality operational control and decision support; system evaluation, process improvement and cost effectiveness.

ISE 552 Design and Control of Production and Service Systems 3.
Prerequisite: ST 371 or ST 372.
Basic terminology and techniques for the control of production and service systems including economic order quantity models; stochastic inventory models; material requirements planning; Theory of Constraints; single and mixed model assembly lines; and lean manufacturing. Emphasis on mathematical models of the interaction between limited capacity and stochastic variability through the use of queueing models to describe system behavior.

ISE 553 Modeling and Analysis of Supply Chains 3.
Prerequisite: ISE 361 and ST 372.
Basic issues in operating supply chains, using state of the art modeling tools available for their analysis. Emphasis on using engineering models to develop insights into the behavior of these systems.

ISE 560 Stochastic Models in Industrial Engineering 3.
ISE/OR 560 will introduce mathematical modeling, analysis, and solution procedures applicable to uncertain (stochastic) production and service systems. Methodologies covered include probability theory and stochastic processes including discrete and continuous Markov processes. Applications relate to design and analysis of problems, capacity planning, inventory control, waiting lines, and service systems.

ISE 589 Special Topics in Industrial Engineering 3.
Special developments in some phase of industrial engineering using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

ISE 601 Seminar 1.
Seminar discussion of industrial engineering problems for graduate students. Case analyses and reports.

ISE 610 Special Topics in Industrial Engineering 3-6.
Special developments in some phase of industrial engineering using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

ISE 637 Directed Study in Industrial Engineering 1-3.
Independent study providing opportunity for individual students to explore topics of special interest under direction of a member of faculty.

ISE 639 Advanced Directed Study in Industrial Engineering 1-3.
Independent study providing an opportunity for individual graduate students to explore advanced topics of special interest under the direction of a member of the faculty.

ISE 677 Industrial Engineering Projects 1-6.
Prerequisite: MIE candidates.
Investigation and written report on assigned problems germane to industrial engineering. Maximum of six credits to be earned for MIE degree.

ISE 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ISE 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

ISE 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

ISE 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Thesis research.

ISE 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For student who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

ISE 707 Real-Time Control of Automated Manufacturing 3.
Concepts and application of real-time control of automated manufacturing systems. Development of prototype manufacturing control applications involving introductions to following topics: computer architecture; real-time, multi-tasking operating systems; data modeling; multi-processing systems; local area networks; inter-task communication; and development of multi-tasking control systems. Design development of control system.

ISE 708 Integer Programming 3.
Prerequisite: MA 405, OR (MA,IE) 505, Corequisite: Some familiarity with computers (e.g., CSC 112).
General integer programming problems and principal methods of solving them. Emphasis on intuitive presentation of ideas underlying various algorithms rather than detailed description of computer codes. Students have some "hands on" computing experience that should enable them to adapt ideas presented in course to integer programming problems they may encounter.

ISE 709 Dynamic Programming 3.
Prerequisite: MA 405, ST 421.
Introduction to theory and computational aspects of dynamic programming and its application to sequential decision problems.
ISE 711 Capital Investment Economic Analysis 3.
Prerequisites: ISE 311 and ST 371.
Analysis of economic merits of alternatives including interest and income tax considerations. Risk and sensitivity exploration techniques. Introduction to analytical techniques for multiple objectives or criteria. Use of mathematical programming and computers for capital budgeting.

ISE 712 Bayesian Decision Analysis For Engineers and Managers 3.
Prerequisite: ST 371 or ST 421.
The Bayesian approach to decision making, with numerous applications in engineering and business. Expected value maximization, decision trees, Bayes' theorem, value of information, sequential procedures and optimal strategies. Axiomatic utility theory and controversies. Utility of money, theoretical and empirical determination of utility functions and relationship to mean-variance analysis. Brief introduction to multi-attribute problems, time streams and group decisions.

ISE 714 Product Manufacturing Engineering for the Medical Device Industry 3.
Prerequisite: ISE 515.
Product development course targeted toward the medical device industry. Product design and development, concept generation and selection, parametric feature-based CAD, design for manufacturability (DFM) and assembly (DFA), tolerancing, rapid prototyping, tool design, tool fabrication, and medical device fabrication.

ISE 715 Manufacturing Process Engineering 3.
Manufacturing process engineering, primary, secondary, finishing and assembly processes. Concurrent engineering, process planning, group technology, manufacturing analyses and application of economic analyses.

ISE 716 Automated Systems Engineering 3.
General principles of operation and programming of automated systems. Automated assembly, automated manufacturing, and inspection systems. Control of automated manufacturing. Industrial logic systems and programmable logic controllers. Computer numerical control, industrial robotics, and computer integrated manufacturing.

ISE 718 Micro/Nano-Scale Fabrication and Manufacturing 3.
Prerequisite: ISE 316 or graduate standing in the college of engineering. Introduction to physical theory, process design, analysis, and characterization of micro/nano scale fabrication and manufacturing. The main focus of the course is on the fabrication/manufacturing of important types of microstructures used in micro/nano devices and the techniques and tools used to fabricate and characterize them.

ISE 723 Production Planning, Scheduling and Inventory Control 3.
Prerequisite: OR 501 and ST 511.
An analysis of Production-Inventory systems. Discussion of commonly used planning and scheduling techniques. Introduction to use of math modeling for solution of planning and scheduling problems. Interface with quality control and information systems.

ISE 726 Theory of Activity Networks 3.
Prerequisite: OR 501, OR(E,M,MA) 505.
Introduction to graph theory and network theory. In-depth discussion of theory underlying (1) deterministic activity networks (CPM): optimal time-cost trade offs; the problem of scarce resources; (2) probabilistic activity networks (PERT): critical evaluation of underlying assumptions; (3) generalized activity networks (GERT, GAN): applications of signal flow graphs and semi-Markov process to probabilistic branching; relation to the theory of scheduling.

ISE 731 Multi-Attribute Decision Analysis 3.
Prerequisite: ISE 723 or equivalent.

ISE 740 Engineering Psychology of Human-Computer Interaction 3.
Prerequisite: IE(PSY) 540 or CSC 554.
Exploration of usability of computer technology. Theory and practice of user-centered design for HCI applications. Course focuses on current usability paradigms and principles, psychology of users, iterative and participatory design processes, system requirements specification, prototyping, user support systems, usability evaluation and engineering, interface design guidelines and standards. Application domains include, universal design, virtual reality, and scientific data visualization.

ISE 741 Systems Safety Engineering 3.
Systems safety engineering. Course familiarizes students with techniques for identifying and recognizing potential safety hazards and the concept of risk assessment. Preliminary Hazard Analysis, Failure Modes and Effects Analysis, System and Subsystem Hazard Analysis, Fault Tree Analysis, Process Safety Management (29CFR1910.119) are explored together with applications to hazard analysis and control. Industrial situations and case studies are employed to illustrate usefulness of various system safety techniques.

ISE 742 Environmental Stress, Physiology and Performance 3.

ISE 743 Ergonomic Performance Assessment 3.
Prerequisite: PSY 200, ST 507 and 508.
Fundamentals of ergonomic performance measurement used to assess the effects of environment and system design on human performance. Treatment of topics such as workload measurement, measurement of complex performance, simulator studies, measurement of change, task taxonomies, criterion task sets and statistical methods of task analysis. Problems of laboratory and field research, measurement of change and generalizability of findings.

ISE 744 Human Information Processing 3.
Prerequisite: PSY 200, ST 507 and 508.
Fundamentals of human information processing basic to skilled operator performance and the design of displays, controls and complex systems. Treatment of topics such as channel capacity, working memory, long-term memory, decision making, attention and process monitoring. Problems of display and control design and evaluation, evaluation of textual material, and human-computer interaction.
ISE 745 Human Performance Modeling 3.
Prerequisite: ST 507 or 515 or equivalent; IE (PSY) 540, CSC 554 or IE (PSY) 744.

ISE 747 Reliability Engineering 3.
Prerequisite: ST 511.
Introduction to basic concepts of reliability engineering. Application of probability and statistics to estimate reliability of industrial systems; development of reliability measures; analysis of static and dynamic reliability models; development and analysis of fault trees; analysis of Markovian and non-Markovian models; and optimization of reliability models.

ISE 748 Quality Engineering 3.
Prerequisite: OR 501, ST 511.
Introduction to basic concepts of quality engineering. Statistical process control (SPC) methods, acceptance sampling techniques, concept of parameter design and statistical as well as analytical techniques for its implementation, tolerance analysis and design, components of cost of poor quality and an introduction to quality management.

ISE 754 Logistics Engineering 3.
Prerequisite: ISE 453.
Elements of logistics networks. Supply chain design: facility location and allocation; great-circle distances; geocoding. Multi-echelon production and inventory systems; sourcing decision systems. Vehicle routing: exact, approximation, and heuristic procedures; traveling salesman problem; basic vehicle routing problem and extensions; backhauling; mixed-mode transportation system design.

Prerequisite: MA 303, ST 371.
Formulation and analysis of stochastic models with particular emphasis on applications in industrial engineering; univariate, multivariate and conditional probability distributions; unconditional and conditional expectations; elements of stochastic processes; moment-generating functions; concepts of stochastic convergence; limit theorems; homogeneous, nonhomogeneous and compound Poisson processes; basic renewal theory; transient and steady-state properties of Markov processes in discrete and continuous time.

ISE 761 Queues and Stochastic Service Systems 3.
Prerequisite: MA 421.
Introduction of general concepts of stochastic processes. Poisson processes, Markov processes and renewal theory. Usage of these in analysis of queues, from a completely memoryless queue to one with general parameters. Applications to many engineering problems.

ISE 762 Computer Simulation Techniques 3.
Prerequisite: ST 512 and a scientific programming language.
Basic discrete event simulation methodology; random number generators, simulation designs, validation, analysis of simulation output. Applications to various areas of scientific modeling. Simulation language such as SLAM and GPSS. Computer assignments and projects.

ISE 766 Network Flows 3.
Study of problems of flows in networks. These problems include the determination of shortest chain, maximal flow and minimal cost flow in networks. Relationship between network flows and linear programming developed as well as problems with nonlinear cost functions, multi-commodity flows and problem of network synthesis.

ISE 767 Upper Extremity Biomechanics 3.
Gross and fine anatomy of spine, mechanism of pain, epidemiology, in vitro testing, psychophysical studies, spine stability models, bioinstrumentation: intradiscal pressure, intra-abdominal pressure and electromyography. Biomechanics of lifting and twisting, effects of vibration, effects of posture/lifting style, lifting belts, physical models, optimization models, mathematical models, muscle models, finite element models, current trends in medical management and rehabilitation, chiropractic.

ISE 772 Stochastic Simulation Design and Analysis 3.
Prerequisite: (CSC, ECE, IE, OR) 762 and ST 516.
Advanced topics in stochastic system simulation, including random variate generation, output estimation for stationary and non-stationary models, performance optimization techniques, variance reduction approaches. Student application of these techniques to actual simulations. A current topic research paper required.

ISE 789 Advanced Special Topics In Industrial Engineering 3-6.
Advanced topics in some phase of industrial engineering using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

ISE 790 Advanced Special Topics System Optimization 1-6.
Advanced topics in some phase of system optimization using traditional course format. Identification of various specific topics and prerequisites for each section from term to term.

ISE 794 Advanced Problems in Ergonomics 3.
Exploration in depth of a problem area of contemporary interest involving man-machine-environment interface. Class discussion and analysis of research and theory, with special focus on human factors aspects of systems design and operation.

ISE 796 Research Practicum in Occupational Biomechanics 3.
Biomechanics research topic development, literature evaluation, experimental design, use of bioinstrumentation, data collection, basic data interpretation, statistical analysis, manuscript preparation.

ISE 801 Seminar 7.
Seminar discussion of industrial engineering problems for graduate students. Case analyses and reports.
ISE 812 Special Topics in Mathematical Programming 1-6.
Prerequisite: IE(MA,OR) 505.
Study of special advanced topics in area of mathematical programming. Discussion of new techniques and current research in this area. The faculty responsible for this course select areas to be covered during semester according to their preference and interest. This course not necessarily taught by an individual faculty member but can, on occasion, be joint effort of several faculty members from this university as well as visiting faculty from other institutions. To date, a course of Theory of Networks and another on Integer Programming offered under the umbrella of this course. Anticipation that these two topics will be repeated in future together with other topics.

ISE 816 Advanced Special Topics Sys Opt 1-6.
Advanced topics in some phase of system optimization. Identification of various specific topics and prerequisite for each section from term to term.

ISE 837 Directed Study in Industrial Engineering 1-6.
Independent study providing opportunity for individual students to explore topics of special interest under direction of a member of faculty.

ISE 839 Advanced Directed Study in Industrial Engineering 1-3.
Independent study providing an opportunity for individual graduate students to explore advanced topics of special interest under the direction of a member of the faculty.

ISE 861 The Design of Production Systems 3.
The structure and operation of production planning, scheduling and control systems; emphasis on system structure, capacity planning, master production scheduling, shop loading and supply chain; investigation of current trends.

ISE 877 Industrial Engineering Projects 1-6.
Prerequisite: MIE candidates. Investigation and written report on assigned problems germane to industrial engineering. Maximum of six credits to be earned for MIE degree.

ISE 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ISE 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

ISE 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Interdisciplinary Perspectives (IPGE)

IPGE - IPGE Courses

IPGE 295 Interdisciplinary Perspectives Special Topics 2-3.
Special Topics course offered on a trial basis for the General Education Interdisciplinary perspectives category. Offered for a letter grade.

IPGK - IPGK Courses

IPGK 295 Interdisciplinary Perspectives and Global Knowledge Special Topics 2-3.
Special topics course offering for the general education Interdisciplinary Perspectives and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Interdisciplinary Perspectives (IP) requirement.

Interdisciplinary Perspectives and U.S. Diversity (IPUS)

IPUS - IPUS Courses

IPUS 295 Interdisciplinary Perspectives and U.S. Diversity Special Topics 2-3.
Special topics course offering for the general education Interdisciplinary Perspectives and U.S. Diversity categories. This course may be used for the U.S. Diversity (USD) co-requisite and/or for the Interdisciplinary Perspectives (IP) requirement.

Interdisciplinary Studies (IDS)

IDS - Interdisciplinary Studies Courses

IDS 201 Environmental Ethics 3.
Interdisciplinary consideration of ways in which field of study coupled with personal/cultural values contribute towards either solving or compounding environmental problems; provides framework for process of making ethical decisions.

IDS 210 Introduction to American Studies 3.
Introduction to the interdisciplinary study of American culture through exploration of questions asked and methods used in the field of American Studies. Will incorporate historical, literary, anthropological, and cultural studies approaches and methods for studying culture through texts, objects, and people. Topics to be considered include literary and popular texts, music, clothing, and historical and contemporary American experiences and cultures. Includes one field trip for which students will need to provide their own transportation.
IDS 211 Eating through American History 3.
Examination of cultural and scientific forces that have shaped our relationship with food. Science and politics of dietary recommendations. Influence, over time, of economic, political, and social conditions on food preparation, preference, and nutritional knowledge. Role of religion, family, tradition, and personal experience in shaping eating attitudes and behaviors. Roles played only by women in American food culture.

IDS 220 The Science and Art of Happiness 3.
Interdisciplinary inquiry into the nature of happiness; why it matters, how to promote it, and what harms it. The relevance of the body-mind connection for one's happiness. Current scientific insights into happiness from physiology, neuroscience, and psychology, as well as their connections to Aristotelian ethics and to the concept of suffering in Buddhism. Experiential component of the course consisting of scientifically supported techniques for daily practice for deepening the understanding of course materials and discussions.

IDS 295 Special Topics in Interdisciplinary Studies 1-12.
Detailed investigation of an interdisciplinary topic. Topic and mode of study to be determined by faculty member and/or teach team.

IDS 303 Humans and the Environment 3.
Interactions among human populations in the biophysical system and the environment. Emphasis on current issues, ecological principles and their relationships to basic biophysical processes; considers food, population dynamics, public land and common resources, renewable natural resources, pollution, water resources, energy and non-renewable resources.

IDS 310 Animals in the Global Community 3.
A lecture/seminar exploring the interdisciplinary field of Human Animal Studies in a global context, examining cultural, economic, ethical, ecological, geographical, political, and psychological aspects of human/nonhuman interactions using readings, films, and guest lectures. E.g. what are global ecological/political ramifications of treating cattle as sacred versus breeding them for beef? Why are there more tigers in captivity than in the wild? What are our ethical obligations to the Great Apes? Concepts such as place and placelessness, boundaries, animals as refugees, and interspecies justice will be explored. Course includes team work, and a research project focusing on personal area of interest. Junior Standing or higher.

IDS 340 Interdisciplinary Methods and Issues 3.
Prerequisite: Interdisciplinary Studies Self-Design Majors, Senior standing.
Capstone seminar for students in the IDS self-design major. Intensive study of student's area of concentration, leading to a major research paper.

IDS 495 Special Topics in Interdisciplinary Studies 1-12.
Examination of selected topics of an interdisciplinary nature.

IDS 496 Topics in Film and Interdisciplinary Studies 3.
Detailed examination of film within interdisciplinary contexts. Specific topics will vary from semester to semester.

IDS 498 Independent Study in Interdisciplinary Studies 1-12.
Independent investigation and discussion of a selected topic of an interdisciplinary nature. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

International Studies (IS)

IS - International Studies Courses

IS 200 Introduction to International Studies 3.
Introductory analysis of the diverse processes of globalization, and an interdisciplinary survey of the social, political, economic, and cultural patterns reflected in the interrelations between various regions of the world. Emphasis on the historical and cultural contexts of debates in current global issues. A foundation course for students preparing an International Studies major or minor.

IS 393 Intermediate Seminar in International Studies 3.
Prerequisite: IS 200.
This course offers an in-depth and interdisciplinary examination of various aspects of globalization including economics, human dimensions of environmental change, culture, ethics and power. The course aims to build student understanding of the relationship between theory and application in the field of international studies. This course is designed for international studies minors, as well as majors who are expected to bridge between introductory materials and capstone coursework. Restriction: Minimum of 45 credit hours complete; IS majors and minors only.

IS 395 Special Topics in International Studies 1-3.
IS 491 Senior Seminar in International Studies 3.
Prerequisite: IS 393.
An intensive study of selected international issues, global dimensions and implications, leading to a major research paper.

International Studies (MIS)

MIS - International Studies Courses

MIS 598 Special Topics in International Studies 1-6.
Prerequisite: Advanced Undergraduate standing, PBS status, or Graduate standing.
In-depth investigation of a contemporary topic in the field of international studies in a class context. Topic and mode of instruction to be determined by faculty member. May be taken for up to six hours of credit.

MIS 601 Colloquium in International Studies 3.
Prerequisite: Graduate standing.
Selected topics in international studies required for writing and oral presentation of MIS capstone paper.

MIS 630 Independent Study 1-3.
Prerequisite: MIS standing.
Investigation of topics of particular interest to advanced students under faculty direction on a tutorial basis. Credits and content vary with student/faculty discretion and needs.

MIS 651 Internship in International Studies 1-6.
Prerequisite: MIS standing.
Exposure of student to value systems and technological environment of cultures other than his/her own through a supervised work experience. Application of technological knowledge to development problems. Required technical paper summarizing and analyzing this experience.

MIS 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.
LAR 444 History of Landscape Architecture

The history of designed landscapes. Environmental, social and cultural factors which influence human made landscapes presented with history and art of landscape architecture.
LAR 503 Landscape Architecture Construction Studio 6.
Prerequisite: BLA Majors or MLA Majors.
Studio integrates construction issues into the design experience, involves visits to built sites, construction sites, and construction manufacturing companies.

LAR 505 Landscape Architecture Final Project Studio 6.
Individual semester long projects demonstrating capabilities in a full range of design and production skills.

LAR 510 Graphics for Landscape Architects 3.
Prerequisite: Graduate standing, Corequisite: LAR 500.
A series of demonstrations and exercises to give students exposure to and experience with conventional techniques of graphic representation and presentation.

LAR 521 Values, Theory and Methods of Landscape Architecture 3.
Prerequisite: Graduate standing.
Radical change in profession of landscape architecture in the past decade. New and emerging roles for landscape architect include regional analysis, landscape assessment, land development, urban planning, recreation planning, etc. Development of core values and theories from which each emerged and survey of the techniques and methods of their development.

LAR 565 International Landscape Architecture Design Studio 6.
Prerequisite: Graduate standing the College of Design and approval of the International Study Abroad Office.
Landscape architectural problems and design solution in international setting. Exercises and projects related to design, culture and physical environment of host country. Focus on landscape architecture, gardens and urbanism through sketching and documentation, discussion, site investigation, historical context, current design examples and design applications.

LAR 579 Human Use of the Urban Landscape 3.
Prerequisite: Graduate standing, Master's student in the School of Design or Department of City and Regional Planning (UNC-Chapel Hill).
Techniques for documenting and analyzing user needs at site planning scale. Methods of integrating user needs into design programming in design and redesign projects. Community participation methods. Examples of best practice in design of user-intensive settings in residential, health, education, and recreation. Principles of Universal Design. Fieldwork oriented.

LAR 582 Special Topics In Landscape Architecture 1-6.
Prerequisite: Graduate standing.
Topics of current interest to programs in School of Design offered by faculty in the School. Subjects offered under this number are normally used to test and develop new courses.

LAR 630 Independent Study 1-3.
Prerequisite: Graduate standing.
Special problems in various aspects of design developed under direction of a faculty member on a tutorial basis.

LAR 679 Final Project Studio In Landscape Architecture 1-6.
Prerequisite: LAR 697.
Graduate students sufficiently prepared may undertake selected research investigations. A proposal for such investigations must be submitted prior to consent for enrollment.

LAR 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

LAR 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

LAR 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

LAR 690 Master’s Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

LAR 697 Final Research Project 1-3.
Prerequisite: 3 LAR 500 studios.
Each student in his or her terminal semester not registered in any other courses and in conjunction with terminal case study will prepare and submit to his or her committee a presentation on relevance of one's minor to design process with particular reference to individual's case study.

LAR 896 Summer Dissertation 1.

Leadership in the Public Sector (LPS)

LPS - Leadership in the Public Sector Courses

LPS 200 Introduction to Public Leadership 3.
This introductory course is designed for students who are interested in exploring public sector leadership. It starts with acquainting how to conduct adequate academic research for studying leadership. Covering fundamental concepts and assumptions of leadership, it will focus on necessary skills and approaches for good public and non-profit sector leadership. The course will also address contemporary e-government practices and the role of information technology in the public sector.

LPS 201 The Humanitarian Response to Conflict 3.
LPS 201 offers up an introduction to the ideals and paradoxes of humanitarian intervention, with a special emphasis on military responses to humanitarian crises. This course explores the history, animating ideals and contemporary paradoxes of humanitarian action and related military interventions. Throughout history and ever increasingly in the present, there is an intersection between military and humanitarian operations in conflict zones.
LPS 202 Essentials of Fundraising for Leaders in Public and Non-Profit Institutions 3.
The course covers the basics of fundraising for public and non-profit agencies which include the agencies history, board development, event planning, and the motivation of the giver. In addition, the students will learn the elements of grant proposals related to public sector agencies. The work will include case studies, weekly lectures, discussion assignments, final exam and a special event planning proposal.

LPS 205 International Leadership for the Public Sector 3.

LPS 302 Diversity and Leadership in the Public Sector 3.
This course provides students with information regarding diversity and leadership in history as well as material and activities that foster an understanding of how diversity and leadership intersect in the public sector and how diversity can improve organizational effectiveness and performance. The concept of cultural competency is defined and evaluated as an important component of effective public sector leadership. Students will learn what it means to be a more culturally competent leader.

LPS 315 Public Leadership 3.
Nature and varieties of political leadership by elected and appointed officials in government, officials and volunteers in nonprofit organizations, and leaders of political movements and community groups drawing on literature in political science, self-assessment of student's leadership characteristics and examination of outlets for political leadership activity.

LPS 320 Research Methodology for the Public Sector 3.
This course will teach students to investigate political and policy related questions in a systematic and scientifically rigorous fashion. Students will become familiar with the basic toolkit of social science methodology, practice basic data analysis, and develop a research project. They will acquire the skills essential for evaluating the claims of others and for advancing sound arguments of their own. This knowledge is applicable in a wide variety of organizational research, needs assessment, program and performance evaluation.

LPS 400 Advanced Military Leadership Theory 3.
Advanced Military Leadership Theory (AMLT) is a challenging course that will study, practice, and apply the fundamentals of leadership, values and ethics, personal development, decision-making, influencing and motivating others and team tactics in problem solving and mission accomplishment. Especially military officers enrolled in the LPS program will gain immediate benefit from the leadership self-assessments and new leadership strategies.

LPS 425 Leadership in the Public & Nonprofit Sectors Capstone 3.
Prerequisite: LPS Majors need to have passed LPS 200.
Leadership is a critical topic in public, nonprofit, and business administration. Leadership is what we expect of U.S. presidents, association directors, and CEOs, as well as of mid-level and frontline supervisors. Clearly, leaders are awarded the accolades when the organization succeeds and given the blame for its failures. But organizations succeed not just because of the top leader's actions; a positive leadership climate that pervades the organization helps it to learn, adapt, and perform at a high level. Only LPS major students must complete LPS 200 Introduction to Public Leadership course prior to enrolling in LPS 425.

LPS 490 Undergraduate Internship in Leadership in the Public Sector 1-3.
Prerequisite: LPS 200.
Students can earn 1-3 credits for completing internships in the public sector or non-profit agencies. Emphasis is placed on gaining work experience needed to explore and plan careers in the public and non-profit sector. Students must prepare an internship proposal. Students must provide own transportation for internship. Intern liability insurance is required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Liberal Studies (MLS)

MLS - Liberal Studies Courses

MLS 501 Seminar In Liberal Studies 3.
Prerequisite: Admission to M.A. in liberal studies.
Intensive study of an interdisciplinary issue or area. Seminars, varying each semester, address such topics as arts studies, history and literature, sociobiology and social sciences, world trade and world conflict, and technology and social change.

MLS 630 Independent Study 1-3.
Prerequisite: Admission to M.A. in liberal studies.
Advanced independent study of an interdisciplinary topic under supervision of a faculty member.

MLS 676 Independent Project 1-3.
Prerequisite: Admission to M.A. in liberal studies.
Advanced independent research on an interdisciplinary project under supervision of a faculty member.

MLS 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

MLS 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Life Sciences First Year (LSC)
LSC - Life Sciences First Year Courses

LSC 101 Critical and Creative Thinking in the Life Sciences. Through case studies and discussion-based classes, this course guides students through a metacognitive approach to (1) critical and creative thinking, (2) the nature and practice of science, (3) the rhetoric of science, and (4) the process of learning. This course will challenge students to apply the standards of critical and creative thinking in critiquing their own work and the work of others; guide students to an understanding and appreciation of the rhetoric of science; help students gain an understanding of fundamental principles of the nature and conduct of science within the life science disciplines; and encourage students to become active, engaged learners through an understanding of effective approaches to learning with an emphasis on the neurobiology of learning. Incoming freshmen admitted to the Life Sciences First Year Program (will open available seats to other FR in the spring semester section).

LSC 103 Exploring Opportunities in the Life Sciences. The overarching goal of this course is to help students create a solid foundation on which they can build to enhance their success in college and especially in their studies within the life sciences. Students will be challenged to think intentionally about how they will approach learning inside and outside the classroom and what factors might influence their college experience. Through this course, students will think about their transition from high school to college; identify campus resources and explore academic policies; research potential majors in the life sciences and potential minors; attend and reflect upon cultural and educational events across campus; and create a "plan for success" for their time at NC State. Cannot get credit for both LSC 103, and BCH 103, or MB 103, or PB 103. Restricted to incoming freshmen admitted to the Life Sciences First Year Program.

LSC 170 First Year Seminar in the Life Sciences. Topical problems in the life sciences. LSC 170 provides an opportunity for LSFY students to work in a small group setting with a faculty member to explore a topic within the faculty member's area of expertise. Emphasis will be placed on active, collaborative learning; effective communication skills; higher order cognitive skills; and applying the intellectual standards of critical thinking. Topics and instructors will vary from section to section and from semester to semester. Students can repeat LSC 170 once as long as the two sections are on different topics.

LSC 295 Special Topics in Life Science. New courses offered on a temporary or trial basis for Life Sciences First Year students.

Logic (LOG)

LOG - Logic Courses

LOG 335 Symbolic Logic. Intermediate level introduction to modern symbolic logic focusing on standard first-order logic; topics include proofs, interpretations, applications and basic metalogical results.

LOG 435 Advanced Logic & Metamathematics. Advanced topics in logic and metamathematics: proof procedures, first-order theories, soundness and completeness theorems, recursive functions, the formalization of arithmetic, the Goedel Incompleteness Theorems. Emphasis on mathematical study of logic and mathematics. Students cannot receive credit for both LOG 435 and LOG 535.

LOG 437 Model Theoretic Semantics. One of the following courses: MA/LOG 335, LOG 435, MA 403, MA 407, MA 408, MA 410, MA/CSC 416, MA 421, MA 425, MA 426, CSC 333, CSC 411, CSC 417. Credit is not allowed for both LOG 437 and LOG 537.

LOG 498 Special Topics in Logic. One of the following: (MA/LOG 335, LOG 435, LOG 437, MA 403, MA 407, MA 408, MA 410, MA/CSC 416, MA 421, MA 425, MA 426, CSC 333, CSC 411, or CSC 417). Detailed investigation of selected topics in logic. Topics determined in consultation with head of the department. Course may be used for individualized study. Students cannot receive credit for both LOG 498 and LOG 598 unless the topic is different.

LOG 535 Advanced Logic and Metamathematics. Advanced topics in logic and metamathematics: proof procedures, first-order theories, soundness and completeness theorems, recursive functions, the formalization of arithmetic, the Goedel Incompleteness Theorems. Emphasis on mathematical study of logic and mathematics. Successful completion of mathematics or computer science courses that emphasize proofs, particularly at the 400 level as evidence of requisite.

LOG 537 Model Theoretic Semantics. One of the following courses: MA/LOG 335, LOG 435, LOG 437, MA 403, MA 407, MA 408, MA 410, MA/CSC 416, MA 421, MA 425, MA 426, CSC 333, CSC 411, or CSC 417). Detailed investigation of selected topics in logic. Topics determined in consultation with head of the department. Course may be used for individualized study. Students cannot receive credit for both LOG 537 and LOG 598 unless the topic is different.
MIE - Management Innovation

Entrepreneurship Courses

MIE 201 Introduction to Business Processes 3.
Cross-functional treatment of major activities of business, such as product design, distribution, production, and marketing. Description of specific tasks, via lectures and case studies, in support of major business activities. Interactions among various functional areas of business.

MIE 305 Legal and Regulatory Environment 3.
Introduction to contract, tort and agency law, the judicial system, common law, statutory law, and constitutional law. Review and discussion of the major legal and regulatory issues affecting business including ethics, fiduciary duty, white collar crime, dispute resolution, intellectual property, international, and product safety laws. Credit is not allowed for both BUS 305 and MIE 305.

MIE 306 Managing Ethics in Organizations 3.
Prerequisite: MIE 201.
Management practices to define, communicate, and implement ethical conduct in business organizations. Normative and applied analysis of current ethical dilemmas of corporations in free markets, techniques for effective management of corporate social responsibility, and formulation and implementation of ethics management programs. College of Management majors only.

MIE 310 Introduction to Entrepreneurship 3.
Introduction to planning, formation, and management of entrepreneurial ventures. Fundamental business concepts and managerial skills applied to entrepreneurial ventures. Course projects support experiential learning of critical skills. Some individual off-campus travel is required.

Prerequisite: MIE 201, Sophomore standing.
The systematic principles for managing the human resource component of organizations. Topics include: environmental influences on planning, recruitment, and selection; managing workforce diversity; developing effectiveness and enhancing productivity; compensation, benefits, and security; and strengthening employee-management relations.

MIE 335 Organizational Behavior 3.
Prerequisite: 9 hrs. of social science or 6 hours of social science plus MIE 201.
Survey of contemporary managerial applications for managing people in modern organizations. Topics include: motivation, group dynamics, team development, ethics, communications, organizational politics, leadership, power, organizational development, organizational design and structure. Current managerial issues include total quality management and technology management.

MIE 410 Business Opportunity Analysis 3.
Prerequisite: MIE 310.
Issues and management processes related to the identification of new business opportunities with emphasis on commercializing new technologies. Students will analyze and develop individual plans for commercialization of a new technology or other innovation. New venture formation is the primary focus, but the processes and skills students develop are relevant to new product introductions by existing firms.

MIE 411 Managing the Growth Venture 3.
Prerequisite: MIE 310.
Managing a growth venture with emphasis on entrepreneurial planning in the dynamic context of rapidly growing ventures and the development of managerial skills necessary for successful leadership in high growth ventures. Fundamental concepts, issues and skills are taught through an integrated combination of readings, lectures, discussions, cases analyses, and applied project with a local venture. Students need to provide their own transportation to off-campus sites.

MIE 412 Finance and Accounting for Entrepreneurs 3.
Prerequisite: MIE 310.
Financial planning for new ventures including financial reporting conventions and projection of critical financial amounts for new ventures. Introduction to fundamental accounting and finance concepts applied in the context of entrepreneurial ventures. Topics include projection of revenues, expenses, capital expenditures, cash flows, and balance sheet amounts; and the creation of pro-forma financial statements. Individual student projects integrate financial projections and pro-forma financial statements with the preparation of a complete business plan. Some individual off-campus travel is required.

MIE 413 New Venture Planning 3.
Prerequisite: MIE 310.
Developing the business plan for a new venture and the entrepreneurial process of executing the first phases of new venture creation. Topics include idea conception, entrepreneurship, business planning, market research, entrepreneurial opportunities and strategies. Emphasis is placed on high growth business opportunities. The final deliverable is a complete business plan for a high growth venture and formal presentation of the plan to mock investors. Some individual off-campus travel is required.

MIE 416 The Legal Dynamics of Entrepreneurship 3.
Prerequisite: MIE 310.
Overview of important legal and regulatory issues facing entrepreneurs and start-up entities including legal structure of the organization, intellectual property protection, human resource requirements, product liability, and risk management.

MIE 418 Social Entrepreneurship Practicum 3.
Corequisite: MIE 413.
Application of entrepreneurship skills and knowledge to plan a social entrepreneurial venture envisioned by the student. This course is a capstone course for the Minor in Entrepreneurship and the Concentration in Entrepreneurship. The deliverables include an evaluation of the venture and a formal presentation including a summary of work completed and the implications of the work for each student's project. Students need to provide their own transportation to off-campus sites.

MIE 419 Entrepreneurship Practicum 3.
Corequisite: MIE 413.
Application of entrepreneurship skills and knowledge to plan an entrepreneurial venture envisioned by the student. This course is the capstone course for the Minor in Entrepreneurship. The final deliverable includes an evaluation of the project and a formal presentation that includes a summary of the work completed and the implications of that work each student's project. Some individual off-campus travel is required.
MIE 432 Labor and Employee Relations 3.
Prerequisite: MIE 330.
Utilizing textbook, readings, lectures, and practitioner presentations, students will become familiar with theories and principles of Labor-Management relations and the interchange between unions and employers. The course will review approaches to clarify, manage, reduce and resolve conflicts and to negotiate collective bargaining agreements.

MIE 434 Compensation Systems 3.
Prerequisite: MIE 330.
Compensation philosophy, strategy, and policy. Earnings, individual and group incentive plans, voluntary and mandated benefits. Legal, regulatory, economic, and strategic issues affecting compensation and benefits. Strategies for developing the structure and level of compensation to enhance organizational performance.

MIE 435 Leadership and Management 3.
Prerequisite: MIE 330.
Development of leadership and management skills for organizational settings. Self-awareness: interpersonal needs, attitudes toward change; cognitive styles, ethics and values; listening; communicating; interviewing; time and stress management; creativity and managing creativity. Team building and group dynamics. Leadership and followership: theory and case studies (Churchill, Antigone; Henry V; Machiavelli); the use of power and authority; women and leadership; the use of language in leadership embodiment of leadership traits; effective traits and characteristics of great leaders.

MIE 436 Training and Development 3.
Prerequisite: MIE 330.
Training and development functions in organizations. Needs assessment, legal issues, training program design, learning, training methods, transfer of training, effectiveness and utility of training programs, and executive development.

MIE 438 Staffing 3.
Prerequisite: MIE 330.
Staffing of contemporary organizations including strategic and environmental influences on: HR planning, job analysis, measurement, recruitment, assessment and selection, decision making, employment, and termination. Considerable emphasis on employment and labor recruitment, assessment and selection, decision making, employment, and termination. Considerable emphasis on employment and labor legislation.

MIE 439 Human Resources Practicum 3.
Prerequisite: MIE 330.
Utilizing textbooks, readings, lectures, and practitioner presentations, and an extended study of an organization's Human Resources practice and identified problem area, students will gain practical experience with diagnosing needs and then planning and recommending interventions to address identified needs. Experience with identifying needs will occur through needs assessment interviews with company representatives and analysis and interpretation of key demographic and relevant operational and HR metric data. Student groups need to provide their own transportation to off-campus sites.

MIE 480 Business Policy and Strategy 3.
Prerequisite: (ACC 340 or BUS 340; BUS/MIE 305, BUS 320, BUS 360, BUS 370, MIE 330, and (BUS/ST 350 or ST 302 or ST 361 or ST 370 or ST 372), and (ENG 331 or ENG 332 or ENG 333). Comprehensive analysis of administrative policy-making from the point of view of the general manager. Integration of perspectives from marketing, finance, and other functional areas of management. Use of case analyses and written reports to develop decision making skills.

MIE 495 Special Topics in MIE 1-6.
Presentation of material normally not available in regular course offerings, or offering of new courses on a trial basis.

MIE 498 Independent Study in MIE 1-6.
Detailed investigation of topics of particular interest to advanced undergraduates under faculty direction on a tutorial basis. Credits and content determined by faculty member in consultation with Department Head. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Management (M)

M - Management Courses

M 100 Professionalism, Diversity, and Academic Success in Management 1.
Introduction to criteria for success in the Poole College of Management. Focus on: professional expectations for students in Poole and beyond, the impact of diversity in society and the workplace, and tools and resources for academic and career success.

M 298 Special Topics in Management 1-6.
Presentation of material normally not available in regular course offering.

M 299 Professional Internship in Management 1.
Management Students Only.
Poole College of Management students participating in an approved internship with an organization providing no monetary compensation and where academic credit is required will have an opportunity to gain real world insight and experience into the day-to-day functions and responsibilities encountered in the professional workplace. Course may be completed only once for credit. Accounting majors completing M 299 and ACC 499 may receive a maximum of 6 credit hours for both courses. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

M 300 Leadership and Professional Development 1.
This course is specifically designed for new Peer Leaders and Ambassadors in the Poole College of Management. The goal of the course is to give students the necessary skills to become effective leaders and representatives both within and outside of the College. As a part of this course, students will attend Poole College of Management events/activities. Some topics we will discuss are: professional networking, communication, leadership, working in groups, and presentation skills.

M 399 International Business Dual Degree Student Professional Internship in Management 1-6.
Management Students Only.
International Business Dual Degree students participating in an approved internship with an organization will have an opportunity to gain real world insight and experience into the day-to-day functions and responsibilities encountered in the professional workplace. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.
Marine, Earth, and Atomspheric Sciences (MEA)

MEA - Marine, Earth, and Atomspheric Sciences Courses

MEA 100 Earth System Science: Exploring the Connections 4.
Prerequisite: Competence in high school algebra and chemistry.

MEA 101 Geology I: Physical 3.
Corequisite: Recommended that MEA 110 be taken concurrently.
Systematic consideration of processes operating on and below the earth's surface and the resulting features of landscape, earth structures, and earth materials. Occurrences and utilization of the earth's physical resources.

MEA 110 Geology I Laboratory 1.
Corequisite: MEA 101 or Prerequisite: MEA 100, MEA 120, MEA 140 or MEA 200.
Scientific methodology applied to the study of common rock-forming minerals, common rocks, topographic maps, geologic structures and geologic maps. Field trips.

MEA 130 Introduction to Weather and Climate 3.
Prerequisite: For Non-Majors.
Explores the structure, physical causes, and climatology of weather systems including the jet streams, mid-latitude cyclones, hurricanes, thunderstorms, and tornadoes. Clouds and precipitation, air pollution, climate modification, optical effects (rainbows, halos) and weather instruments. Weather systems and forecasting techniques are illustrated through daily weather map discussions.

MEA 135 Introduction to Weather and Climate Laboratory 1.
Corequisite: MEA 130.
Experiments include effects of air pressure change on temperature and density (gas law); measurement of atmospheric moisture; formation of clouds and hail; effects of variable solar heating. Graphical display and interpretation of data; weather instruments and observations; weather map analysis; forecasting principles.

MEA 150 Environmental Issues in Water Resources 4.
The science of current environmental concerns, particularly those related to water resources. Major topics include weather and climate, natural resource cycles, resource depletion and contamination, societal impacts. Scientific aspects of environmental issues. Required field trips.

MEA 200 Introduction to Oceanography 3.
Corequisite: Recommended that MEA 210 be taken concurrently.
The ocean as a part of our environment including interactions between atmosphere and ocean, ocean circulation, physical and chemical properties of sea water, marine geology and marine biology.

MEA 202 Geology II: Historical 3.
Prerequisite: (MEA 100, MEA 101, MEA 120, MEA 140 or MEA 200) and MEA 110; Corequisite: Recommended that MEA 211 be taken concurrently.
The second semester of the basic introductory sequence in geology. Utilization of the principles of geology to reconstruct and understand the earth's history. Geologic events that cause modification of the earth's crust, emphasizing North America. History of life and the environmental significance of changes in animal and plant life through geologic time.

MEA 210 Oceanography Lab 1.
Corequisite: MEA 200.
Complements the lecture course in Oceanography. Numerous demonstrations and resource materials visualize basic oceanographic concepts such as geological processes operating in the marine realm, the chemical properties of seawater, oceanic circulation, tides and waves, as well as processes affecting the biology of the oceans.

MEA 211 Geology II Laboratory 1.
Reconstruction and interpretation of events in the history of the earth. Interpretation of sedimentary rocks, construction and interpretation of geological maps, identification of fossil organisms and utilization of fossils in the reconstruction of earth history.

MEA 213 Introduction to Atmospheric Sciences I 2.
Corequisite: MA 141.
Introduction to the atmospheric environment. Fundamental concepts and applications of atmospheric physics and dynamics and how they relate to day-to-day and seasonal weather as well as climate change.

MEA 214 Introduction to Atmospheric Sciences II 2.
Prerequisite: MEA 213.
Second course in a series introducing the atmospheric environment. Topics include midlatitude weather systems from planetary scale to mesoscale, climate and climate change, implications and impacts of the climate change, and air pollution.

MEA 220 Marine Biology 3.
Prerequisite: MEA 200 or BIO 181.
Introduction to marine plants and animals, their adaptations to life in the sea and ecological interactions in selected marine environments (e.g. coral reefs, deep sea, salt marshes). Interactions of man with the sea: food from the seas, biology of diving. Optional trip.

MEA 250 Introduction to Coastal Environments 3.
Prerequisite: MEA 200/210 or MEA 101/110.
A global survey of coastal habitats, the processes that shape these dynamic environments, and the physicochemical controls that regulate their indigenous biological communities.

MEA 251 Introduction to Coastal Environments Laboratory 1.
Corequisite: MEA 250.
Complements the lecture course Introduction to Coastal Environments (MEA 250). Experiments involving the physical, chemical and biological processes that shape a variety of coastal environments.

MEA 300 Environmental Geology 4.
Prerequisite: MEA 101 or MEA 150 or MEA 140 or SSC 200.
Geologic aspects of the environment. Effects of humans upon or interactions with geologic processes. Geologic considerations in land use planning, waste disposal, water resources, and natural resources. A field and lab oriented course with combined lecture/laboratory. Inquiry-based learning approach to study the basic processes of environmental geology and develop research skills. Required field trips.

MEA 312 Atmospheric Thermodynamics 4.
Prerequisite: MA 141, PY 205; Corequisite: MA 241, PY 208.
Introduction to atmospheric thermodynamics for meteorology majors. Topics include the equation of state for mixture of gases; first and second laws of thermodynamics; diabatic and adiabatic processes for dry and moist air; measurement and phase changes of water vapor. Atmospheric statics: static stability of moist air; CAPE and vertical acceleration. Focus will be on applying the rigorous framework of classical thermodynamics to derive and solve quantitatively the governing equations describing these processes.
MEA 315 Mathematics Methods in Atmospheric Sciences 4.
Prerequisite: MA 116, MA 141, MA 241; Corequisite: MA 242.
For sophomore meteorology and marine science students. A complement to MA 242 designed to prepare students for quantitative atmospheric applications. Topics include an introduction to vectors and vector calculus, atmospheric waves, phase and group velocity, perturbation analysis, fourier decomposition, matrix operations, chaos and predictability. For MY, MMY, and MRM majors only.

MEA 320 Fundamentals of Air Pollution 3.
Prerequisite: MA 121 or MA 131 or MA 141, CH 201 or CH 203, PY 131 or PY 201 or PY 205 or PY 211.
Air pollution sources, and the influence of natural and anthropogenic processes on the atmosphere. Roles of local, state and federal governments in air pollution control and importance of the Clean Air Act and its amendments.

MEA 321 Fundamentals of Air Quality and Climate Change 3.
Prerequisite: CH 101, CH 201, MA 141, MA 241; Corequisite: PY 205.
An intermediate-level introduction, for meteorology majors, to the physical and chemical environment of the atmosphere and to climate change. Topics include the atmosphere’s chemical composition; atmospheric chemical reaction processes in gas phase, liquid phase, and on particle surfaces.

MEA 323 Earth System Chemistry 3.
Prerequisite: (CH 201 or CH 203) and (CE 373 or any MEA course).
Chemistry of the earth with an emphasis on the interactions of the biosphere, geosphere and atmosphere. The origin and chemical evolution of the solar system, chemical cycles in the environment, and the impact of man on biogeochemical processes.

MEA 410 Introduction to Mineralogy and Petrology 4.
Prerequisite: (MEA 100, MEA 101, MEA 120, MEA 140 or MEA 200), and MEA 110 and CH 101/102.
Introduction to the fundamentals of mineralogy, optical mineralogy, and igneous and metamorphic petrology. Description and identification of minerals, using physical properties and geological associations. Optical properties of non-opaque rock-forming minerals, emphasizing petrographic thin sections. Introduction to igneous and metamorphic environments and rocks. Description and classification of common crystalline rocks. Required overnight field trips; additional expenses required.

MEA 411 Marine Sediment Transport 3.
Prerequisite: MEA 101 or MEA 200, MA 241, PY 201 or PY 205.
Quantitative study of sediment transport in the marine environment including an introduction to fluid mechanics and sediment transport theory. Discussion of the processes and products of sediment transport in specific marine environments from estuaries to the deep sea and interpretation of sediment transport processes from sedimentary structures. Credit not allowed for both MEA 411 and MEA 562.

MEA 412 Atmospheric Physics 3.
Prerequisite: MA 242, PY 208.
Physical and analytical descriptions of atmospheric aerosols, clouds/fogs, and precipitation processes; size distribution and sources of atmospheric aerosols; impact of aerosols on visibility and climate; microstructure of warm and cold clouds and their interaction with solar and terrestrial radiation; collision-coalescence and ice phase mechanisms of precipitation formation; atmospheric electricity; planned and inadvertent weather modification; weather radar; atmospheric optics.

MEA 415 Climate Dynamics 3.
Prerequisite: MEA 412 and MEA 422.
A physically based treatment of climate change, climate variability, and climate models, for upper-level undergraduate meteorology majors. Topics include Earth’s energy balance and the greenhouse effect, drivers of future and past climate change, and climate model projections of global warming and its implications. Cannot receive credit for both MEA 415 and MEA 515.

MEA 421 Atmospheric Dynamics I 3.
Prerequisite: MA 242 and PY 208 and MEA 312.
Meteorological applications of fluid kinematics: divergence, vorticity, deformation, advection, mass continuity and vertical motion. Atmospheric dynamics: the equation of motion on a rotating earth; component equations in Cartesian, polar-spherical and pressure coordinates. Scale analysis and simplifications. Cases of horizontal flow: geostrophic and gradient wind, ageostrophy and acceleration; thermal wind and vorticity.

MEA 422 Atmospheric Dynamics II 3.
Prerequisite: MEA 421.
Vorticity and potential vorticity equations; dynamics of synoptic-scale motions; quasi-geostrophic theory; atmospheric waves including shallow water, internal gravity, inertia-gravity, and Rossby waves; finite difference methods; numerical weather prediction; atmospheric instabilities including static, Kelvin-Helmholtz, inertial, symmetric, barotropic, and baroclinic instabilities.

MEA 425 Introduction to Atmospheric Chemistry 3.
Prerequisite: MA 141, CH 201, (PY 205, PY 211 or MEA 320).
The course covers history, regulations, sources, physics, and chemistry of major air pollutants and factors affecting their transport and fate. Emphasis is placed on atmospheric chemistry and physics underlying five major air pollutant problems including urban outdoor air pollution, indoor air pollution, acid deposition, stratospheric ozone reduction, and global climate change. Credit will not be allowed for MEA 425 and MEA 525.

MEA 440 Igneous and Metamorphic Petrology 4.
Prerequisite: MEA 410.
The study of rocks formed by the crystallization of magmas (igneous) and by the recrystallization of existing rocks (metamorphic), with emphasis on whole-rock and mineral compositions, classification, petrography, hand-sample and thin-section identification, and the rock origins in terms of magma genesis and emplacement and tectonics. Field trips are required.

MEA 443 Synoptic Weather Analysis and Forecasting 4.
Prerequisite: MEA 421.
Analysis and forecasting of mid-latitude weather systems with emphasis on simplified models and methods. Barotropic model, Rossby waves; baroclinic structure, upper-level wave evolution, forecasting; surface cyclone evolution, Sutcliffe-Petterssen model. Numerical computation methods; numerical weather prediction and operational models, subjective and objective analysis of meteorological fields.

MEA 444 Mesoscale Analysis and Forecasting 4.
Prerequisite: MEA 443.
Analysis and forecasting of mid-latitude weather systems with emphasis on mesoscale phenomena. Definition of the mesoscale, approximations to the governing equations, basic measurements and techniques; observations, basic governing dynamics, and forecasting of mesoscale phenomena, including drylines, low-level jets, conditional symmetric instability, synoptically-induced circulations, thunderstorms, mesoscale convective, and severe convective weather.
MEA 449 Principles of Biological Oceanography 3.
Biological productivity and trophic relationships in plankton, nekton and benthos; community ecology of selected habitats (estuaries, intertidal zones, coral reefs, deep sea); and adaptation of organisms to the marine environment. Credit is not allowed for both MEA/BIO 449 and MEA/BIO 549.

MEA 450 Introductory Sedimentary Petrology/Stratigraphy 4.
Prerequisite: MEA 410.
Properties, classification, geologic occurrences, and origin of minerals and rocks formed by physical, chemical, and biologic processes at and near the earth’s surface. Principles of division of stratified terrains into natural units, correlation of strata, interpretation of depositional environments and facies. Required field trips.

MEA 451 Structural Geology 4.
Prerequisite: MEA 410.
Basic principles of geometric, kinematic and dynamic analysis as applied to fractures, shear zones, folds, and fabrics of deformed rock bodies. Considers both brittle and ductile realms of the crust from microscale to regional tectonics. Required overnight field trips.

MEA 454 Marine Physical-Biological Interactions 3.
Prerequisite: MEA 460 and MEA/ZO 449.
Space-time relationships between physics and biology; influence of Reynolds Number on aquatic life style; aspects of physical and biological mathematical modeling; influence of biology on physical phenomena; influence of static physical/chemical properties on biology; influence of dynamic physical phenomena (turbulence, waves and advection) on biology within the water column and its boundaries. Credit is not allowed for both MEA454 and 554.

MEA 455 Micrometeorology 3.
Prerequisite: MEA 422 or MAE 308.
Energy budget near the earth’s surface; soil temperatures and heat transfer; air temperature, humidity, and wind distribution in the planetary boundary layer; fundamentals of viscous flows and turbulence; semiempirical theories of turbulence; exchanges of momentum, heat and moisture in the atmospheric surface layer; air modification due to changes in surface properties; agricultural and forest micrometeorology.

MEA 458 Introduction to Tropical Meteorology 3.
Prerequisite: MEA 422.

MEA 459 Field Investigation of Coastal Processes 5.
Prerequisite: MEA 250.
Coastal zone processes and dynamics with emphasis on the forcing factors that regulate changing coastal landforms, the ecology and physicochemical character of coastal ocean water-masses, seabed morphologies, landscape academes, etc. Field observations and field techniques will be emphasized in tidal-freshwater coastal wetlands, estuaries, barrier island, tidal inlets, continental shelves and shelf-margin habitats. Additional feeds required.

MEA 460 Principles of Physical Oceanography 3.
Prerequisite: MA 241 or MA 231; Corequisite: PY 203, PY 208 or PY 212.
Introduction to principles and practices of physical oceanography. Equation of state of seawater; energy transfer to the ocean by thermal, radiative and mechanical processes; the heat budget; oceanic density distribution; oceanic boundary conditions; conservations equation; air-sea interaction; global fluxes and general description of major ocean currents. Credit is not allowed for both MEA 460 and MEA 540.

MEA 461 Undergraduate Cruise Experience 1.
Corequisite: MEA 200 or MEA 220.
Broad exposure to planning and execution of oceanographic research operations, including demonstration of techniques and equipment regularly used aboard ships and familiarization with acquisition and processing of oceanographic data via preparation for and participation in a demonstration cruise under the guidance of NCSU oceanography faculty members.

MEA 462 Observational Methods and Data Analysis in Marine Physics 3.
Prerequisite: MEA 460.
Practical experience in the observational techniques used by physical oceanographers. Basic instrumentation described, emphasizing principles rather than detailed descriptions. Both direct and indirect techniques used to define the three-dimensional circulation of the ocean as a function of time.

MEA 463 Fluid Physics 3.
Prerequisite: MA 341 and PY 208.
A derivation of the basic equations governing fluid motion in a rotating coordinate system. Equations include conservation of mass or the continuity equation, momentum equations, thermodynamic energy equation and the vorticity equation. Application of equations to simplified oceanic flows which include surface gravity waves, inertial motion, geostrophic motion, Ekman dynamics and vorticity dynamics.

MEA 464 Ocean Circulation Systems 3.
Prerequisite: MEA 460.
Dynamical processes governing ocean circulation. Driving of ocean currents by the atmosphere, currents on a rotating spherical earth. Mid-ocean gyre, western boundary currents, equatorial current systems, and polar circulation. Currents in coastal regions and shallow-water processes.

MEA 465 Geologic Field Camp 4.
Prerequisite: MEA 450 and MEA 451.
Introduction to field instruments and techniques used in geological sciences. Geologic field mapping in areas ranging from undeformed sedimentary rocks to complexly deformed crystalline rocks. May include field techniques specific to engineering geology, geophysics, hydrogeology, and paleontology. Preparation of maps and reports. Four-week course taught off-campus, typically out-of-state. Additional fees required.

MEA 466 Preparatory Course for Field Camp 1.
Introduction to theory, instruments, and techniques used in MEA 465 geologic field camp. Geologic context of the area where field camp will be held. Students will supply their own graph paper for a map cross-section exercise. Credit for this course cannot be used to fulfill elective credits in any Geology curricula.
MEA 467 Marine Meteorology 3.
Prerequisite: MEA 422 or MEA 460.
Basic equation and concepts. Review of ocean and atmospheric circulations. Ocean mixed layer, air-sea interaction and coastal ocean and meteorological processes, marine boundary layer and cloud processes.

MEA 469 Ecology of coastal Resources 3.
Prerequisite: MEA 250 and MEA 220 or MEA 449.
Anthropogenic impacts on estuarine and coastal marine ecosystems. Survey of basic biological, physical, chemical and geological mechanisms underlying habitat-specific functioning, followed by discussion, in-class presentation, and critique of real and hypothetical case studies involving anthropogenic impacts.

MEA 470 Introduction to Geophysics 3.
Prerequisite: PY 208 or 212.
Structure of the earth, a dynamic and evolving entity, as inferred from seismology, gravity, magnetism and heat flow. Geodynamic processes responsible for continental drift; plate tectonic theory; regional geophysics of selected areas.

MEA 471 Exploration and Engineering Geophysics 3.
Prerequisite: PY 208 or PY 211.
Geophysical methods applied to exploring the earth's shallow subsurface. Principles of gravity, magnetic, electrical, and seismic exploration surveys. Planning, conducting, and interpreting geophysical surveys.

MEA 473 Principles of Chemical Oceanography 3.
Prerequisite: CH 201 or CH 203.
Chemical processes controlling the composition of oceans, including discussions of chemical equilibria, biological cycling of nutrients and use of chemical tracers in marine environment; consideration of origin and chemical history of oceans. Credits not allowed for both MEA 473 and MEA 573.

MEA 476 Worldwide River and Delta Systems: Their Evolution and Human Impacts 3.
Prerequisite: Senior undergraduate or Graduate standing.
Survey of major world rivers and deltas, such as the Amazon, Mississippi, Yello, Yangtze, Mekong, Ganges-Brahmaputra, Indus, Nile, etc. Descriptions of their initiation, development, and evolution processes. Definitions of the impacts caused by climate changes and human activities. Examination of the river-ocean interactions and sedimentary and geochemical processes in terms of sea-level change, monsoon, and sediment dispersal and deposition.

MEA 479 Air Quality 3.
Prerequisite: CE 373, CE 382; or CHE 311 (CHE Majors); or MEA 421 (MEA Majors), Corequisite: ST 370; ST 380 (MEA Majors).
Introduction to: risk assessment, health effects, and regulation of air pollutants; air pollution statistics; estimation of emissions; air quality meteorology; dispersion modeling for non-reactive pollutants; chemistry and models for tropospheric ozone formation; aqueous-phase chemistry, including the "acid rain" problem; integrated assessment of air quality problems; and the fundamentals and practical aspects of commonly used air quality models. Credit is allowed only for one of CE/MEA 479 or CE/MEA 579.

MEA 481 Geomorphology: Earth's Dynamic Surface 3.
Prerequisite: (MEA 100, MEA 101, MEA 120, MEA 140 or MEA 200) and MEA 110.
Landforms and the processes responsible for their origin. Emphasis on the geologic principles involved in interpreting the origin and evolution of various landforms, and discussion of North American geomorphic process.

MEA 485 Introduction to Hydrogeology 3.
Prerequisite: (MEA 101 or MEA 202), (MA 131 or MA 141), (CH 201 or CH 203), and (PY 201, PY 205, or PY 211).
Basic science of groundwater flow in geological media. Saturated and unsaturated flow, Darcy's equation, heterogeneity and anisotropy, flownets, storage properties of geological materials, effective stress, equations for steady and unsteady flow, recharge, groundwater exchange with surface water, groundwater flow to pumping wells, estimation of hydraulic properties of aquifers, contaminant plumes and chemical transport in groundwater.

MEA 488 Meteorology for Media 3.
Prerequisite: One of the following ENG 331, ENG 332, ENG 333, or COM 110.
Communication of weather and climate information with the public, including examination of communication theory, public communication of science, and geoscience communication research. Production techniques for television and digital graphics, presentation to camera, and audio recordings.

MEA 493 Special Topics in MEAS 1-6.
Directed individual study or experimental course offering.

MEA 495 Senior Seminar in the Marine, Earth, and Atmospheric Sciences 1.
Emphasis on student professional development. Discussions of professional opportunities, resources, and ethics. Professionals from the public and private sectors introduce students to career options in marine, earth and atmospheric sciences.. Strategies for finding jobs and graduate programs are presented. Students reflect on future career goals and plans.

MEA 498 Internship in MEAS 1-6.
Awards academic credit for learning that occurs during internships. Requires daily journal and written summary report. Successful completion of the course based on review of summary report by an MEAS faculty, who shall be identified by the student prior to the internship. Transportation expenses may be incurred. MEAS majors only. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

MEA 507 Discipline-based Education Research in the Geosciences 3.
This course will prepare students to explain the conditions necessary for learning to occur in college geoscience classes; plan lessons that address geoscience literacy standards and incorporate activities that feature multiple levels of Bloom's taxonomy; describe how they would determine if student work meets defined learning goals; create effective geoscience learning environments for lecture and lab settings; analyze the teaching of others using validated instruments; and design a geoscience teaching and learning research project.

MEA 510 Air Pollution Meteorology 3.
Prerequisite: MAE 308 or MEA 455 or MEA 700.
Wind structure in atmospheric surface layer and planetary boundary layer; temperature structure and stability; mixed layer and inversions; turbulence intensity and scale; meteorological factors affecting dispersion of pollutants; diffusion theories and models; diffusion and transport experiments; plume rise, fumigation and trapping; removal processes; effects of buildings and hills; effects of local winds.
ME 511 Introduction to Meteorological Remote Sensing.
Meteorological remote sensing data sets used in operational forecast and research applications. Sensor physical principles. Emphasis is on understanding the strengths and weaknesses of the different types of observational data so that the student can judge adequacy of purpose for their applications.

Prerequisite: MEA 412 and MEA 421.

ME 514 Advanced Physical Meteorology.
Fundamental laws and concepts of thermodynamics and electromagnetic radiative transfer considered in an atmospheric context. Application of these principles to a number of meteorological problems, including radiative climate models, the global energy balance, atmospheric aerosols, lidar/radar backscatter and remotely sensed temperature fields.

Prerequisite: MEA 412 and MEA 422.

ME 515 Climate Dynamics.
A physically based treatment of climate change, climate variability, and climate models, for upper-level undergraduate meteorology majors. Topics include Earth’s energy balance and the greenhouse effect, drivers of future and past climate change, and climate model projections of global warming and its implications. Cannot receive credit for both MEA 415 and MEA 515.

Prerequisite: MEA 412 and MEA 422.

ME 517 Fundamentals of Climate Change Science.
This course will present the basic science of climate change, including chemical and physical systems and processes. The students will be introduced to how the climate system works and the role of greenhouse gases in the climate system. Students will learn about climatological data, climate models and how predictions/projections are made. Emphasis will be placed upon relating predicted/projected changes to manifestations such as sea level rise and changes in the distribution and character of precipitation. Topics include the primary climate components, ocean-atmospheric teleconnections, decadal and multi-decadal climate indices, natural and anthropogenic climate variability, and climate model projections.

Prerequisite: Graduate standing.

ME 519 Barriers to Climate Change Literacy.
Investigates the discipline-based geoscience education lenses of the cognitive, affective, and behavioral barriers to climate literacy and the practical interventions for addressing them. Critically analyzes key aspects of climate science, common misconceptions, mental models, cultural influences, and risk perceptions about climate change. Students engage with the public and design projects for overcoming barriers to climate change literacy. The course features relevant readings, classroom discussions, student peer-review, and summative and formative course feedback though course assignments and exams. Minimum of 50% seats reserved for Climate Change and Society Certificate program students.

Prerequisite: Graduate standing.

ME 525 Introduction to Atmospheric Chemistry.
The course covers history, regulations, sources, physics, and chemistry of major air pollutants and factors affecting their transport and fate. Emphasis is placed on atmospheric chemistry and physics underlying five major air pollutant problems including urban outdoor air pollution, indoor air pollution, acid deposition, stratospheric ozone reduction, and global climate change. Credit will not be allowed for MEA 425 and MEA 525.

Prerequisite: MA 141, CH 201, (PY 205, PY 211 or MEA 320).

ME 540 Principles of Physical Oceanography.
Introduction to principles and practice of physical oceanography. The equation of state of seawater; energy transfer to the ocean by thermal, radiative and mechanical processes; the heat budget; oceanic boundary conditions; geographical distribution of oceanic properties; observational methods; conservation equations; simple waves and tides; physical oceanography of North Carolina coastal zone. Application of Fourier analysis techniques to interpretation of low-frequency motions in ocean and atmosphere. Review of Fourier method. Filtering of tidal signals. Spectral estimates and calculation of current ellipses. Identification of coherent motions and their empirical orthogonal modes. Data from field experiments used in lectures and homework assignments. Credit is not allowed for both MEA 460 and MEA 540.

Prerequisite: MEA 425 and PY 212.

ME 549 Principles of Biological Oceanography.
Environmental dependencies, biological productivity, and trophic relationships in plankton, nekton and benthos; Sampling methods and experimental design; Human impacts on marine systems. Credit is not allowed for both MEA 449 and MEA(ZO)549.

Prerequisite: BIO 181.

ME 554 Marine Physical-Biological Interactions.
Space-time relationships between physics and biology; influence of Reynolds Number on aquatic life style; aspects of physical and biological mathematical modeling; influence of biology on physical phenomena; influence of static physical/chemical properties on biology; influence of dynamic physical phenomena (turbulence, waves and advection) on biology within the water column and its boundary. Credit is not allowed for both MEA 440 and MEA(ZO) 549.

Prerequisite: MEA 460/560 and MEA 449 or MEA(ZO) 549.

ME 562 Marine Sediment Transport.
Quantitative study of sediment transportation in the marine environment including introduction to fluid mechanics and sediment transportation theory. Processes and products of sediment transportation in specific marine environments from estuaries to deep sea and the interpretation of sediment transport processes from sedimentary structures. Credit not allowed for both MEA 411 and MEA 562.

Prerequisite: MEA 101 or MEA 200, MA 241, PY 201 or PY 205.

ME 570 Geological Oceanography.
A comprehensive overview of the geological aspects of oceanography. Topics include: a) marine geophysics and the evolution of ocean basins, b) sedimentological processes and the formation of marine deposits, c) marine geochemistry and authigenic sedimentation, d) paleoceanography and the interpretation of marine stratigraphy.

Prerequisite: CH 201 or CH 203.

ME 573 Principles of Chemical Oceanography.
Chemical processes controlling the composition of oceans, including discussions of chemical equilibria, biological cycling of nutrients and use of chemical tracers in marine environment; consideration of origin and chemical history of oceans. Credit is not allowed for both MEA 473 and MEA 573.
ME 574 Advanced Igneous Petrology 3.
Prerequisite: MEA 440.
Physicochemical principles related to igneous petrogenesis. General principles and specific problems including origin, differentiation and emplacement of magmas and the possible relationships of igneous processes to global tectonics.

Prerequisite: MEA 410.
Theory of quantitative analysis of geologic material by electron beam application; laboratory operation of electron microprobe to acquire chemical composition and x-ray images of geologic material.

ME 579 Principles of Air Quality Engineering 3.
Prerequisite: CE 373, CE 382; or CHE 311(CHE Majors); or MEA 421(MEA Majors), Corequisite: ST 370; ST 380(MEA Majors).
Introduction to: risk assessment, health effects, and regulation of air pollutants; air pollution statistics; estimation of emissions; air quality meteorology; dispersion modeling for non-reactive pollutants; chemistry and models for tropospheric ozone formation; aqueous-phase chemistry, including the "acid rain" problem; integrated assessment of air quality problems; and the fundamentals and practical aspects of commonly used air quality models. Credit is allowed only for one of CE/MEA 479 or CE/MEA 579.

ME 580 Air Quality Modeling and Forecasting 4.
Prerequisite: CSC 112, CE 425/525, ME 479/579.
Topics include numerical solutions to ODEs/PDEs, atmospheric chemistry, cloud and aerosol microphysics, emission modeling, meteorological modeling, and model design, applications, and evaluation. It is targeted for students who would like to learn about air quality modeling and who are prospective air quality model users.

ME 581 Fluid Mechanics in Natural Environments 3.
Prerequisite: CE 382 or MEA 463 or permission of instructor.
Free surface flows of water and air occurring in natural fluid systems and influencing environmental transport and mixing. Review of fundamental principles of fluids, covering the scales relevant to both engineering and geo-physical applications. Topics and examples include waves, instability, stratification, turbulent boundary layers, jets and plumes, and open channel flows. Cannot receive credit for both CE 581 and ME 581.

ME 582 Geospatial Modeling and Analysis 3.
The course explains digital representation and analysis of geospatial phenomena and provides foundations in methods and algorithms used in GIS analysis and modeling. Special focus is on terrain modeling, geomorphometry, watershed analysis and introductory GIS-based modeling of landscape process (water, sediment). This course includes analysis from lidar data, 3D visualization, and principles of open source GIS. Introductory level knowledge of GIS or surveying/ geomatics principles is required.

ME 585 Physical Hydrogeology 3.
Prerequisite: MEA 101, MEA 110, MA 241, and PY 201 or PY 205.
Physical aspects of groundwater flow in geological media. Saturated and unsaturated flow, Darcy's equation, heterogeneity and anisotropy, storage properties of geological materials, effective stress, governing equations for steady and unsteady flow, recharge, groundwater exchange with surface water, groundwater flow to wells, estimation of hydraulic properties of aquifers.

ME 591 Special Topics in Marine Science 1-6.
Opportunity for advanced undergraduate and graduate students to study timely special problem areas in Marine Science and Engineering.

ME 592 Special Topics in Earth Sciences 1-6.
Special topics in earth sciences, provided to groups or to individuals.

ME 593 Special Topics in Atmospheric Science 1-6.
Special topics in atmospheric science, provided to groups or to individuals.

ME 599 Regional Geology of North America 1-6.
Prerequisite: MEA 101 or MEA 120, Senior standing.

ME 601 Seminar 1.
Prerequisite: Graduate standing.
Presentation by each student of one seminar on his/her current research.

ME 611 Special Topics in Marine Sciences 1-6.
Special topics in earth sciences, provided to groups or to individuals.

ME 612 Special Topics in Earth Sciences 1-6.
Special topics in atmospheric science, provided to groups or to individuals.

ME 613 Special Topics Atmospheric Sciences 1-6.

ME 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ME 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

ME 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's Student.
Thesis Research.

ME 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged.
ME 700 Environmental Fluid Mechanics 3.
Prerequisite: MA 241, PY 208.
Basic concepts and laws governing motion of atmosphere and oceans developed from first principles, including approximations valid for environmental flows, kinematics, dynamics and thermodynamics of fluid flows as well as introduction to environmental turbulence. Credit is not allowed for both ME 463 and ME 700.

ME 703 Atmospheric Aerosols 3.
Prerequisite: (CH 201 or CH 203) and (PY 205 or PY 211), Corequisite: MEA 412.
An understanding of aerosols as primary air pollutants, indoor versus outdoor pollution, transformation processes, prediction of atmospheric concentrations, scavenging of aerosols, transport of air pollutants on a regional scale, discussion of national experiments to characterize and study impact of urban-industrial pollution, tropospheric aerosol and weather, stratospheric aerosol, effect of aerosols on atmospheric warming and cooling and air-quality models.

ME 705 Dynamic Meteorology 3.
Prerequisite: MEA 422.
Brief review of classical and physical hydrodynamics; scale analysis of dynamic equations; atmospheric instabilities; dynamics of tropical convections; perturbation theory and approximations for atmospheric wave motions.

ME 707 Planetary Boundary Layer 3.
Prerequisite: MEA 455 or MEA 721.
Review of basic equations and concepts of planetary boundary layers. The closure problem and semi-empirical theories of turbulence, buoyancy effects on mean flow and turbulence, instrumentation and observational platforms for PBL experiments, observed characteristics of atmospheric boundary layers, numerical and physical modeling of PBL and its parameterization in large-scale atmospheric circulation models.

ME 708 Atmospheric Turbulence 3.
Prerequisite: MAE 550 or MEA 700 or MEA 707.

ME 710 Atmospheric Dispersion 3.
Prerequisite: MAE 550 or MEA 700 or MEA 510.

ME 712 Mesoscale Modeling 3.
Prerequisite: MEA 705.
Modeling mesoscale weather phenomena including midlatitude cyclones, mesoscale convective complexes and squall lines. Application of finite difference, spectral and implicit methods and coordinate transforms to these problems. Utilization of explicit representations of moist processes. Development of parameterizations of convective clouds, planetary boundary layer and moist processes.

ME 713 Mesoscale Dynamics 3.
Prerequisite: MEA 700 and MEA 705.

ME 714 Atmospheric Convection 3.
Prerequisite: MEA 412, MEA 700, MEA 705.
Structure, physics and dynamics of convective clouds and cloud systems; fundamental equations for modeling convection; microphysical parameterization schemes; influence of instabilities on convective cloud systems; severe thunderstorms dynamics; tornadogenesis theories; mesoscale convective systems; upscale feedback effects of convection; cumulus parameterization schemes.

ME 715 Dynamics of Mesoscale Precipitation System 3.
Prerequisite: MEA 444.
Frontogenesis theory; inertial and conditional symmetric instability; mesoscale gravity waves and wave-CISK; conveyor belts; seeder-feeder processes and precipitation generating cells; classification and dynamics of precipitation band types.

ME 716 Numerical Weather Prediction 3.
Prerequisite: MEA 463 or MEA 560.
Parameterization of physical processes in atmospheric modeling, including numerous hands-on experiments to allow evaluation and analysis of process representation in models. Emphasis on experimental design: Using numerical models as a tool with which to test scientific hypotheses. Investigation of data assimilation and ensemble prediction techniques. Journal discussion and student presentations are featured prominently. A semester project allows students to apply knowledge to thesis projects, and synthesize class concepts. Some comfort level with Linux computing environment, shell scripting, and programming languages such as FORTRAN required.

ME 717 Advanced Weather Analysis 3.
Prerequisite: MEA 444, MEA 705.
Evolution of physical and dynamic structure of synoptic and mesoscale storm systems occurring in middle and high latitudes. Recent advances in understanding these storm systems through intensive field experiments and computer modeling. Introduction to contemporary analysis techniques through laboratory exercises shedding light on storm structure, dynamics and scale interaction.

ME 719 Climate Modeling 3.
Prerequisite: MEA 705.

ME 721 Air-Sea Interaction 3.
Prerequisite: MEA 422 or MEA 560.
Review of basic equations and concepts of turbulent transfer in geophysical flows, air-sea interaction processes and their importance to man’s activities, theory and observation of wind-generated ocean surface waves, turbulent transfers in planetary boundary layer of marine atmosphere, oceanic mixed layer, development of thermocline and inversion.
ME 735 Fourier Analysis of Geophysical Data 3.
Prerequisite: MA 341 and ST 511.

ME 741 Synoptic Physical Oceanography 3.
Prerequisite: ME 560.
Basic discussion of the techniques and terminology of synoptic physical oceanography; focus on water characteristics and their relationship to currents in the individual oceans; a systematic quantitative description of the character of ocean waters and their movements.

ME 743 Ocean Circulation 3.
Prerequisite: MEA 700 or PY 411.
Basic study of mechanics of ocean circulation with emphasis on various simple models of circulation systems.

ME 744 Dynamics of Shelf Circulation 3.
Prerequisite: MEA 700.
Description and models of dynamic processes on the shelf, including seiches and tides in gulfs, propagation of tides and storm surges, wind-induced coastal upwelling, continental shelf waves and coastally trapped waves. Steady circulation driven by winds, river plumes and density forcing, formation of shelf-break fronts; and influence from deep-ocean currents.

ME 750 Marine Benthic Ecology 3.
Prerequisite: ZO 402, ZO 509 or ZO 760 or MEA(ZO) 550.
Marine benthic systems in deep sea and in shallow waters, focusing upon abiotic and biotic processes regulating density, diversity and taxonomic and functional composition. Discussions of benthic-pelagic coupling, predation, interspecific competition, biogeography, sampling problems, evolutionary trends, trophic structure and community organization.

ME 752 Marine Plankton Ecology 3.
Prerequisite: BCH 451 and MA 121 and ZO 419.
Examination of worldwide relationships between physical-chemical environment and planktonic organisms. Organism descriptions; effects of light, temperature, salinity, density, water motion and chemical constituents on organisms; interactions among different organisms emphasizing competition and predation; community structure, distribution and succession; and mathematics models of distribution, production and interaction.

ME 759 Organic Geochemistry 3.

ME 760 Biogeochemistry 3.
Processes involved in the biogeochemical cycling of C, N, S and related biogenic elements. Stable isotopic and other geochemical signatures of biological processes. Introduction to modeling chemical distributions in sediments. The impact of biogeochemical processes on atmospheric chemistry.

ME 762 Marine Geochemistry 3.
Prerequisite: CH 331, MEA 560.
Detailed examination of chemical processes occurring in marine environment. Chemical evolution of the oceans, continental and submarine weathering, particle scavenging of reactive elements from water, column, formation of biogenic and metalliferous deposits, sediment diagenesis and marine geochronology.

ME 763 Geochemistry 3.
Prerequisite: CH 331 or 431.

ME 779 Advanced Air Quality 3.
Prerequisite: (CH 201 or CH 203) and MEA(CE) 479.
Local, regional and global scale chemical interactions, transport and behavior of trace gases (sulfur carbon, nitrogen, hydrocarbon, and photochemical oxidants) in the atmosphere. covers three primary elements of air quality: anthropogenic and natural emissions of trace gases; interactions of the pollutants in the atmosphere; and monitoring and sampling of gaseous and particulate pollutants.

ME 785 Chemical Hydrogeology 3.
Prerequisite: (CH 201 or CH 203) and (MEA 585 or CE 584).

ME 788 Advanced Structural Geology 3.
Prerequisite: MEA 451.
Principles of rock mechanics and their application in solving geologic problems; finite strain analysis of deformed rocks; advanced techniques of structural analysis; petrofabrics; development of various geologic structures. Emphasis upon application of principles and techniques in the field.

ME 789 Topics In Appalachian Geology 3.
Prerequisite: MEA 440, 450 and 451.
Examination of geology of areas within Appalachian orogenic belt. Lectures, discussions, reading and review of current literature and consideration of ideas concerning geological evolution of region. Required field trips.

ME 790 Geotectonics 3.
Prerequisite: MEA 440, 450, 451.
In-depth examination of current ideas in plate tectonic theory. Plate tectonic controls on orogeny, orogenic belts, magmatism and metallogeny.

ME 791 Advanced Special Topics in Marine Science 1-6.
Opportunity for advanced undergraduate and graduate students to study timely special problem areas in Marine Science and Engineering.

ME 792 Advanced Special Topics in Earth Sciences 1-6.
Special topics in earth sciences, provided to groups or to individuals.

ME 793 Advanced Special Topics in Atmospheric Science 1-6.
Special topics in atmospheric science, provided to groups or to individuals.
ME 796 Exploration And Engineering Geophysics 3.
Prerequisite: MEA 470 or PY 208.
Geophysical methods as applies to exploring the earth’s mineral and energy resources and to investigating subsurface geological structure and physical properties. Principles, measurements, analyses, and interpretations of gravity, magnetic, electric, electromagnetic, seismic methods. Required research paper.

ME 801 Seminar 1.
Prerequisite: Graduate standing.
Presentation by each student of one seminar on his/her current research.

ME 810 Special Topics 1-6.

ME 811 Special Topics in Marine Sciences 1-6.
Special topics in earth sciences, provided to groups or to individuals.

ME 812 Special Topics in Earth Sciences 1-6.
Special topics in atmospheric science, provided to groups or to individuals.

ME 813 Special Topics in Atmospheric Sciences 1-6.
Special topics in earth sciences, provided to groups or to individuals.

ME 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Dissertation Research.

ME 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Materials Science and Engineering (MSE)

MSE - Materials Science and Engineering Courses

MSE 200 Mechanical Properties of Structural Materials 3.
Prerequisite: Grade of C or better in CH 101.
An introduction to the atomic and grain structure of structural materials emphasizing the mechanical properties. Effects of mechanical and heat treatments on structure and properties. Fatigue and creep of materials, fracture toughness, mechanical and non-destructive evaluation, effects of environment. Design considerations, characteristics of metals, ceramics, polymers and composites. Not for Materials majors.

Prerequisite: Grade of C or better in CH 101.
Introduction to the fundamental physical principles governing the structure and constitution of metallic and nonmetallic materials and the relationships among these principles and the mechanical, physical and chemical properties of engineering materials.

MSE 203 Introduction to the Materials Science of Biomaterials 3.
Prerequisite: C or better in CH 101, CH 102 and PY 205.
This course introduces fundamental physical principles governing the structure, processing, properties and performance of metallic, ceramic and polymeric materials. Relationships are developed defining how mechanical, physical and chemical properties are controlled by microstructure and chemistry. Material failure modes are developed with an emphasis on biocompatibility and the applications/performance of materials in the human body. Basic aspects of material biocompatibility are presented, leading into studies of the current and future applications of biomaterials.

Corequisite: MSE 201.
Principles and application of basic techniques for characterizing the structure of materials at different length scales. Optical microscopy, electron microscopy, scanning probe microscopy, X-ray diffraction and spectroscopic methods applied to metals, ceramics, polymers and semiconducting materials.

MSE 260 Mathematical Methods for Materials Engineers 3.
Corequisite: MA 242.
Use of MATLAB programming environment to illustrate and discuss principles and applications of analytical and numerical mathematical methods that are central to materials science and engineering. Data plotting, curve fitting, complex numbers and series, Fourier series and transforms, numerical integration and differentiation, linear algebra and matrix manipulation, initial and boundary value problems, numerical solution to ordinary differential equations and transport simulation through the use of partial differential equations.

MSE 270 Materials Science and Engineering Seminar 1.
Corequisite: MSE 201.
This course surveys the field of materials science and engineering and introduces students to contemporary issues. Job and career opportunities at the BS and graduate degree levels are presented. Students are introduced to opportunities for laboratory assistant jobs in the MSE department, summer internships, co-ops and summer research experiences at NCSU and other institutions. Students will learn to prepare effective resumes, technical reports and oral presentations.

MSE 300 Structure of Materials at the Nanoscale 3.
Prerequisite: C- or better in MSE 201.
This course covers the structure of materials at the nanometer scale. Structure includes the periodic arrangements of atoms and ions in crystalline solids, the amorphous networks of atoms, ions, and molecules in glassy materials, and the molecular structure of polymeric and biological materials. The typical means of characterizing nanostructure are also reviewed. Finally, the course will introduce the structure of novel nanomaterials like nanotubes, buckyballs and self assembled monolayers.
MSE 301 Introduction to Thermodynamics of Materials 3.
Prerequisite: MSE 201 or MSE 203; MSE majors must have a C- or better in MSE 201.
Review of classical thermodynamics and thermodynamic relationships. Use of statistical methods to describe entropy and other thermodynamic properties. Description of vapor-, liquid-, and solid-phase equilibrium in unary and other multicomponent material systems. Treatment of ideal and nonideal solution behavior in inorganic alloys and organic polymers. Application of gas-phase reaction kinetics and identification of the criteria required for reaction equilibria.

MSE 320 Introduction to Defects in Solids 3.
Prerequisite: C- or better in MSE 201. Classification of defects as point, line, surface or volume types. Geometrical and crystallographic aspects of defects. Defects in metallic, ionic and covalently bonded crystal structures. Physical, chemical, electronic and magnetic aspects of defects. Field quantities and forces associated with defects. Novel defects in nanostructured materials and semicrystalline materials.

MSE 335 Experimental Methods for Analysis of Material Properties 2.
Prerequisite: C- or better in MSE 201. Principles and application of basic techniques for characterizing the properties of materials. Mechanical, thermal, electrical, optical and magnetic property measurements applied to metals, ceramics, polymers and semiconducting materials.

MSE 350 Mechanics of Materials 3.
Prerequisite: MA 341. Covers fundamental topics in stress analysis and mechanics of materials including statics and structures, elasticity, plasticity, fracture, fatigue, testing methods, and engineering applications.

MSE 355 Electrical, Magnetic and Optical Properties of Materials 3.
Prerequisite: PY 208 and MA 341. Fundamental treatment of the electronic properties of materials, including the electrical, magnetic and optical characteristics. The role of electrons, band structure, and Brillouin zones on the various classes of materials is discussed from the semiclassical and quantum mechanical viewpoints. Applications of these principles to specific technological devices is also covered.

MSE 360 Kinetic Processes in Materials 3.
Prerequisite: MA 341 and MSE 301. Types, mechanisms, and kinetics of solid state phase transformations are covered with selected applications to all classes of materials. Mechanisms of diffusion and techniques for diffusion calculations are presented. The role of surface energy and strain in the evolution of structure during transformation is presented. Phenomena at different size scales (atomic, nano, micro) are described relative to the evolution of structure during transformation.

MSE 362 Biomaterials Characterization 3.
Prerequisite: (CH 220 or 221 or 225) and (BME 203 or MSE 200 or MSE 201). Introductory laboratory experience focused on integrating engineering and biological principles by exploring key topics in biomaterials. Topics include evaluation and interpretation of experimental results, modeling and testing of tissues and cells, and biomaterial/tissue, cell interactions. BME and MSE Majors only; Juniors and Seniors.

MSE 370 Microstructure of Inorganic Materials 3.
Prerequisites: MSE 300, MSE 301, and MSE 320. Structure-property relationships in metallic and ceramic materials. Crystal structures of important metallic and ceramic elements, alloys, and compounds. Binary and ternary phase diagrams for notable systems will be presented. Microstructural features to be covered include grain size and distribution, multiphase microstructures, and defects. Examples of important metallic and ceramic systems for structural, electrical, optical and magnetic applications will be given.

Prerequisite: CH 220 and MSE 300. Covers microstructure and properties of soft materials including polymer molecular weight distributions, amorphous polymers, semicrystalline polymers, copolymers, elastomers, biopolymers, soft tissue, bone and cellular structure. The design and function of implantable biomaterials are also covered.

MSE 409 Nuclear Materials 3.
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

MSE 420 Mechanical Properties of Materials 3.
Prerequisite: MSE 370 and MSE 380. Basic concepts for mechanical properties of materials, elasticity, plasticity, viscoelasticity, rubber elasticity, strengthening mechanisms, creep, fracture and fatigue. Includes metals, ceramics, polymers and composites. Describes mechanical properties for nanostructured materials and biomaterials.

MSE 423 Introduction to Materials Engineering Design 1.
Prerequisite: Senior standing in MSE. Materials selection in engineering design involving lecture, cooperative and problem-based learning techniques. Course stresses creative thinking, problem solving methodology, interdependence of design with analysis and evaluation, teamwork and sharpening of communication skills. Real industrial problems are introduced which are analyzed by student teams. This a half-semester course. The classroom lectures end at mid-semester. In the second half of the semester, student teams develop a proposal which is submitted to the industrial sponsors at the end of the semester. The proposal defines future work to be conducted under MSE 470. Senior standing in MSE.

MSE 440 Processing of Metallic Materials 3.
Prerequisite: MSE 360 and MSE 370. Corequisite: MSE 420. Fundamental concepts of solidification and their application to foundry and welding practices; metal forming concepts applied to forging, rolling, extrusion, drawing, and sheet forming operations; machining mechanisms and methods; powder metallurgy; advanced processing methods including rapid solidification and mechanical alloying. Credit for both MSE 440 and MSE 540 is not allowed.
MSE 445 Ceramic Processing 3.
Prerequisite: MSE 370.
Ceramic processing of powders includes powder synthesis, characterization, mixing, and size reduction. Theoretical aspects include particle packing, particles in suspension, and some aspects of surface chemistry. Forming methods include compaction, casting, and extrusion. Firing and sintering are examined. Credit for both MSE 445 and MSE 545 is not allowed.

MSE 455 Polymer Technology and Engineering 3.
Prerequisite: MSE 380.
This course will cover commercial polymers, polymer blends and miscibility, dynamic mechanical behavior, Boltzmann superposition principle, ultimate properties of polymers, polymer rheology and processing, recycling and design and selection of polymeric materials. Guest instructors from industry will give presentations on contemporary topics in polymer technology and engineering. Field trips are required.

MSE 456 Composite Materials 3.
Prerequisite: MSE 420.
The course covers the basic principles underlying properties of composite materials as related to the properties of individual constituents and their interactions. Polymer, metal and ceramic matrix composites are included. Property averaging and micromechanics of composites are covered at an introductory level. Emphasis is placed on design and processing of composite systems to yield desired combinations of properties. Credit for both MSE 456 and MSE 556 is not allowed.

MSE 460 Microelectronic Materials 3.
Prerequisite: MSE 355.
Processes and characterization techniques relevant to microelectronic materials science and technology. Boule growth, wafer preparation, oxidation, epitaxial growth, doping techniques, metallization, and device applications of elemental and compound semiconductors. Electrical, structural and chemical characterization of semiconductors is included as well as materials considerations relevant to device fabrication. Credit for both MSE 460 and MSE 560 is not allowed.

MSE 465 Introduction to Nanomaterials 3.
Prerequisite: MSE 201.
Introduction to nanoparticles, nanotubes, nanowires, and nanostructured films, emphasizing their synthesis, structural and property characterization, novel physical and chemical properties, applications and contemporary literature.

MSE 470 Materials Science and Engineering Senior Design Project 3.
Prerequisite: MSE 423.
Design project in materials science and engineering requiring problem definition and analysis, synthesis, and presentation of a designed solution. Students work in groups with a faculty adviser on problems submitted by local industrial sponsors or emerging research issues that represent the major specialty areas including ceramics, metals, polymers, or electronic materials.

MSE 480 Materials Forensics and Degradation 3.
Prerequisite: MSE 370 and MSE 380.
Covers principles and prevention of the degradation of materials. The topics will include dissolution of polymer and ceramic materials, electrochemical corrosion, oxidation of metals and polymers, degradation of polymers, friction and wear, degradation of electrical device components, bio-deterioration of materials, and failure analysis. The general practice in failure analysis will be applied to a variety of case studies to illustrate important failure mechanisms. Credit will not be given for both MSE 480 and MSE 580.

MSE 485 Biomaterials 3.
Prerequisite: BME 203 and BIO 183.
Introduction to materials of natural and synthetic origin and brief survey of historic, current, and future applications of materials in medicine. Examination of the classes and properties of degradable and non-degradable materials, interactions of materials with cells and tissues, and fundamentals of biocompatibility including inflammation, encapsulation, and infection. Discussion of biomaterial failure mechanisms, regulation, and related ethical concerns.

MSE 490 Special Topics in Materials Engineering 1-4.
Offered as needed for the development of new courses in materials engineering, including areas such as metals, ceramics, polymers, or microelectronic materials.

MSE 495 Materials Engineering Projects 1-6.
Prerequisite: Junior standing or Senior standing.
Application of engineering principles to a specific materials engineering project by a student or small group of students under supervision of a faculty member. A written report required.

MSE 500 Modern Concepts in Materials Science 3.
Prerequisite: Graduate standing.
Fundamentals of structure, structure modification and properties of materials with emphasis on structure-property relationships and modern theory of solids.

MSE 509 Nuclear Materials 3.
Prerequisite: MSE 201.
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

MSE 531 Physical Metallurgy 3.
Prerequisite: MAT 321, MAT 450, Corequisite: MAT 430.
Application and design of selected metals and alloys in a theoretical and practical context. Relationships between mechanical behavior, and alloy chemistry, microstructure, and processing. Corrosion resistance; fatigue failure; creep; brittle fracture. Design of specific microstructures. Credit for both MAT 431 and MSE 531 is not allowed.

MSE 539 Advanced Materials 3.
Prerequisite: MSE 201 and MAE 314.
Introduces production/structure/property/function relation and application of a number of materials mainly for biomedical, mechanical and aerospace applications. Topics include ultra light materials (production, processing and applications of cellular solids), biomaterials (classes and application of materials in medicine and dentistry), composites (classes and application), refractory materials and coatings for high temperature applications, thin film shape memory alloys for micro-electro mechanical systems (MEMS).

MSE 540 Processing of Metallic Materials 3.
Prerequisite: MAT 321, MAT 450, Corequisite: MAT 431.
Fundamental concepts of solidification and their application to foundry and welding practices; metal forming concepts applied to forging, rolling, drawing, and sheet forming operations; machining mechanisms and methods; powder metallurgy; advanced processing methods including rapid solidification and mechanical alloying. Credit for both MAT 440 and MSE 540 is not allowed.
MSE 545 Ceramic Processing 3.
Prerequisite: MAT 434, MAT 435.
Powder synthesis, characterization, colloidal processing, forming method, theory of sintering, aspects of microstructural control. Credit for both MAT 445 and MSE 545 is not allowed.

MSE 555 Polymer Technology and Engineering 3.
Prerequisite: MSE 424 or equivalent.
Classes of commercially important polymers, advanced topics in phase behavior, viscoelasticity, fracture and ultimate properties of polymers; polymer rheology, and processing; design of polymeric materials. Credit for both MSE 455 and MSE 555 is not allowed.

MSE 556 Composite Materials 3.
Prerequisite: MAT 450.
Basic principles underlying properties of composite materials as related to properties of individual constituents and their interactions. Emphasis on design of composite systems to yield desired combinations of properties.

MSE 560 Microelectronic Materials Science and Technology 3.
Prerequisite: MAT 331, Corequisite: MAT 431.
Processes and characterization techniques relevant to microelectronic materials science and technology. Boule growth, water preparation, oxidation, epitaxial growth, doping techniques, metallization, and device applications of elemental and compound semiconductors. Electrical, structural and chemical characterization of semiconductors as well as materials considerations relevant to device fabrication. Credit for both MAT 460 and MSE 560 is not allowed.

MSE 561 Organic Chemistry Of Polymers 3.
Principles of step reaction and addition polymerizations; copolymerization; emulsion polymerization; ionic polymerization; characterization of polymers; molecular structure and properties.

MSE 565 Introduction to Nanomaterials 3.
Prerequisite: MSE 500.
Introduction to nanoparticles, nanotubes, nanowires, and nanostructured thin films, emphasizing their synthesis, structural and property characterization, novel physical and chemical properties, applications and contemporary literature.

MSE 566 Mechanical Properties of Nanostructured Materials 3.
Prerequisite: MSE 500 or an instructor approved equivalent.
The course covers mechanical behavior that is unique to nanostructured materials, typically nanocrystalline metals and alloys. The various methods for processing nanostructured materials will be presented, emphasizing those that are suitable for mechanical property studies. The thermal stability of nanocrystalline microstructures will be covered and strategies for inhibiting grain growth described. Mechanical testing methods for uniaxial loading, creep, fracture and fatigue will be covered. Testing methods will also be discussed in context with structure-property relations, deformation mechanisms and failure modes.

MSE 575 Polymer Technology and engineering 3.
Prerequisite: MAT 424.
Classes of commercially important polymers, advanced topics in phase behavior, viscoelasticity, fracture and ultimate properties of polymers; polymer rheology, processing and permeability; design of polymeric materials. Credit for both MAT 475 and MSE 575 is not allowed.

Prerequisite: Graduate standing.
Commercialization potential of new technologies, products and processes. Marketing, organizational, financial, operational and manufacturing issues. Strategic assessment and planning. Innovation management. Entrepreneurial transfer mechanisms including spinoffs, licensing and high-technology start-ups. Practical application with project and team management skills development.

Prerequisite: MBA/MSE 576.
Theoretical and practical team-based application of systematic evaluation techniques for assessing commercial potential of technologies, products and processes. Prioritization and selection based on technology strategy.

MSE 580 Materials Forensics and Degradation 3.
Prerequisite: MSE 370 and MSE 380.
Covers principles and prevention of the degradation of materials. The topics will include dissolution of polymer and ceramic materials, electrochemical corrosion, oxidation of metals and polymers, degradation of polymers, friction and wear, degradation of electrical device components, bio-deterioration of materials, and failure analysis. The general practice in failure analysis will be applied to a variety of case studies to illustrate important failure mechanisms. Credit will not be given for both MSE 480 and MSE 580.

MSE 593 Master's Supervised Research 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

Prerequisite: Master's student.
Institution in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.
MSE 702 Defects In Solids 3.  
Prerequisite: MSE 500.

MSE 703 Interaction of Electrons with Materials 3.  
Prerequisite: MSE 500.  
This course reviews basic interaction of electrons with solids through the free electron theory, quantum mechanics and quantum phenomena, and band theory. The course provides a practical foundation for understanding of electrical behavior of metals, semiconductors, dielectrics and non-crystalline materials and how this behavior relates to structure and materials processing. Graduate standing in MSE, CBME, ECE, PY, CH, or consent of the instructor required.

MSE 704 Interaction of Photons with Materials 3.  
Prerequisite: MSE 703.  
This course will answer basic questions on photon-matter interaction: Why do materials appear the way we see them? How can we change and control that? How can we apply their optical properties in various optical elements and optoelectronic devices? The course provides a practical foundation for working with and developing of materials for modern optoelectronic and photonic technologies. Graduate standing in MSE, CBME, ECE, PY, CH, or consent of the instructor required.

MSE 705 Mechanical Behavior Of Engineering Materials 3.  
Prerequisite: MAT 450, MAT 702.  
Coverage of both fundamental and engineering aspects of mechanical behavior of materials. Elasticity, plasticity and dislocation theory concepts used to describe phenomenological behavior and micro-mechanical mechanisms. Strengthening mechanisms in crystals, high-temperature deformation, fracture mechanics, fracture toughening mechanisms and cyclic deformation.

MSE 706 Phase Transformations and Kinetics 3.  
Prerequisite: MAT 700, MAT 710, and MSE 500.  
Homogeneous and heterogeneous nucleation, spinodal decomposition, interface and diffusion-controlled growth, formal theory of transformation kinetics, precipitation, coarsening, order-disorder, and martensitic transformations.

MSE 708 Thermodynamics Of Materials 3.  
Prerequisite: MAT 301 and MSE 500.  
Review of first and second laws of thermodynamics, equilibrium and irreversible processes, open and closed systems, partition functions and particle distribution functions. Applications include extension of thermodynamic potentials to situations where electrical, magnetic and stress fields present, heat capacity of crystals, electron gas in metals, solution models, binary phase diagrams and rubber elasticity in polymers.

MSE 710 Elements Of Crystallography and Diffraction 3.  
Crystal symmetry, lattices and space groups; elementary diffraction by crystalline matter; experimental methods of x-ray diffraction.

MSE 712 Scanning Electron Microscopy 3.  
Electron optics, sources and detectors. Beam specimen interactions, secondary and backscattered electrons, and EDS. Resolution limits, experimental conditions, related techniques, beam-induced damage and materials modifications.

Prerequisite: MAT 710.  
Electron optics, electron-solid interactions, electron diffraction, image contrast, defect characterization, analytical and high resolution microscopy. Parallel laboratory demonstrations and exercises. Laboratory enrollment limited to twelve, but laboratory may be waived with consent of instructor.

Prerequisite: MSE 715.  
This course provides the advanced graduate student with a detailed knowledge of transmission electron microscopy covering: advanced topics in electron sources, details of electron optics and aberrations, aberration corrected electron microscopy, modeling and simulating interactions of electrons with the specimen, image processing and analysis, and analytical techniques (EELS and EDX). Graduate standing in MSE, CHE, ECE, PHY, CH required or consent of the instructor.

MSE 731 Materials Processing by Deformation 3.  
Prerequisite: Six hrs. of solid mechanics and/or materials.  
Presentation of mechanical and metallurgical fundamentals of materials processing by deformation. Principles of metal working, friction, forging, rolling, extrusion, drawing, high energy rate forming, chipless forming techniques, manufacturing system concept in production.

MSE 741 Principles of Corrosion 3.  
Prerequisite: MAT 201 and CH 431 or MAT 301.  
Fundamentals of metallic corrosion and passivity. Electro-chemical nature of corrosive attack, basic forms of corrosion, corrosion rate factors, methods of corrosion protection. Laboratory work included.

MSE 751 Thin Film and Coating Science and Technology I 3.  
Prerequisite: MAT 700.  
Vacuum science and technology including gas kinetics, gas flow calculations, system design and use of various pumps, materials and components. Atomistics of solid surfaces. Nucleation and growth of films and coatings.

MSE 752 Thin Film and Coating Science and Technology II 3.  
Prerequisite: MSE 751.  

MSE 757 Radiation Effects on Materials 3.  
Interaction of radiation with matter with emphasis on microstructural modification, physical and mechanical effects. Defects generation and annealing, void swelling, irradiation growth and creep, and irradiation induced effects in reactor materials are discussed. Current theories and experimental techniques are discussed.

MSE 760 Materials Science in Processing of Semiconductor Devices 3.  
Prerequisite: MAT 460 and MSE 500.  
Ion implantation and doping for advanced semiconductor devices, thin films and epitaxy, silicides, ohmic contacts and interconnection metallurgy, oxidation and nitridation, gettering of impurities and dopant segregation phenomena, electromigration, electronic packaging materials science and advanced device concepts.

MSE 761 Polymer Blends and Alloys 3.  
Prerequisite: CHE 316 or MAT 301.  
Thermodynamics, morphological characteristics and properties of multilayer polymer systems composed of homopolymers or copolymers. Interfacial characteristics and modification of multicomponent polymer blends through emulsification and reactive blending. Microphase ordering in block copolymers, and emerging technologies employing these nanostructured materials. Conformational properties and dynamics of macromolecules constrained near an interface.
MSE 763 Characterization Of Structure Of Fiber Forming Polymers 3.  
Prerequisite: MA 301, PY 208.  
Theories, experimental evidence and characterization methods of the  
molecular fine structure of fiber forming polymers in the solid state.  
Characterization methods include X-ray diffraction, microscopy, infrared,  
thermal and magnetic resonance.  

MSE 770 Defects, Diffusion and Ion Implantation In Semiconductors 3.  
Prerequisite: MAT 701.  
Thermodynamics of vacancies and interstitials, defect complexes,  
electronic defects, defect annealing processes, self diffusion, dopant  
and impurity diffusion, substitutional/interstitial diffusion, diffusion  
in amorphous solids, electro transport, fundamentals of ion-solid  
interactions, semiconductor doping atomic structure of defects, damage  
annealing processes, supersaturated alloys, laser annealing, ion beam  
mixing phenomena, ion implantation and rapid thermal annealing  
processes, shallow junctions and devices.  

MSE 771 Materials Science of Nanoelectronics 3.  
Prerequisite: MSE 500.  
Effects of scale less than 100 nm on the electrical properties &  
processing of all materials (metals, semiconductors, ceramics,  
polymers and biomaterials). Current status and future prospects for the  
semiconductor industry summarized by invited scientists and by review  
and discussion of selected current literature. Student presentations and  
research proposals are required.  

MSE 775 Structure of Semicrystalline Polymers 3.  
Prerequisite: MAT 425.  
Structure and organization of semicrystalline polymers, from molecular  
scale to bulk state, including chain configuration, unit cell geometries,  
polymer crystallography, single crystals, spherulites, epitaxial  
crystallization, morphology, crystal defects, annealing and deformation  
mechanisms. Emphasis on analysis of x-ray diffraction, electron  
diffraction and electron microscopy data for structural characterization.  

MSE 791 Advanced Topics in Materials Science and Engineering 1-3.  
Prerequisite: Graduate standing.  
Special studies of advanced topics in materials science and engineering.  

MSE 795 Advanced Materials Experiments 1-3.  
Prerequisite: Senior standing or Graduate standing.  
Advanced engineering principles applied to a specific experimental  
project dealing with materials. A seminar period provided; required written  
report.  

MSE 801 Seminar 1.  
Reports and discussion of special topics in materials science and  
engineering and allied fields.  

MSE 885 Doctoral Supervised Teaching 1-3.  
Prerequisite: Doctoral student.  
Teaching experience under the mentorship of faculty who assist the  
student in planning for the teaching assignment, observe and provide  
feedback to the student during the teaching assignment, and evaluate the  
student upon completion of the assignment.  

MSE 890 Doctoral Preliminary Exam 1-9.  
Prerequisite: Doctoral student.  
For students who are preparing for and taking written and/or oral  
preliminary exams.  

Prerequisite: Doctoral student.  
Instruction in research and research under the mentorship of a member  
of the Graduate Faculty.  

Prerequisite: Doctoral student.  
Dissertation Research.  

MSE 896 Summer Dissertation Research 1.  
Prerequisite: Doctoral student.  
For graduate students whose programs of work specify no formal course  
work during a summer session and who will be devoting full time to thesis  
research.  

Prerequisite: Doctoral student.  
For students who have completed all credit hour requirements, full-time  
enrollment, preliminary examination, and residency requirements for the  
doctoral degree, and are writing and defending their dissertations.  

Math & Science Education (EMS)  

EMS - Math Science Education Courses  

EMS 204 Introduction to Mathematics Education 2.  
Prerequisite: ED 100; Corequisite: ED 204.  
This course introduces students to the teaching of Mathematics in middle  
and high schools. Students will become familiar with state mathematics  
standards and national recommendations for teaching mathematics.  
The course has a required fieldwork component in local K-12 schools,  
and students are responsible for their own transportation to and from  
the schools. Students are required to purchase internship liability  
insurance to participate in this course. Contact University Insurance &  
Risk Management for details on acquiring the insurance and the current  
charge. This course is restricted to Teacher Education majors.  

EMS 205 Introduction to Teaching Science 2.  
Prerequisite: Sophomore standing; Corequisite: ED 204.  
Introduces perspective teachers to the teaching of science in the middle  
and high school. Topics include nature of the science learner,  
common alternative conceptions in science, introduction to science  
teaching strategies, and the science curriculum in middle and high  
school. Sophomore status or higher is required. Sophomore status or  
higher is required.  

EMS 296 Special Topics in Education 1-3.  
Individual or group study of particular areas of education at the freshman  
and sophomore levels. Specific topics will vary from semester to  
semester.  

EMS 373 Instructional Materials in Science 3.  
Prerequisite or Corequisite: EMS 205 and ED 204.  
Development and selection of teaching materials that reflect concepts  
of content and emphasis in middle and secondary school science.  
Experimental and laboratory approaches, including use of microcomputer  
and video technologies. 2 lecture hours and 6 lab hours per week for  
7 weeks.  

EMS 375 Methods of Teaching Science I 3.  
Prerequisite: EMS 205, ED 204.  
Classroom, laboratory, and internship experiences for pre-service  
teachers to effectively prepare, plan and assess learning environments in  
the middle and secondary science classroom and instructional laboratory.  
Emphasis placed on knowledge, skills, and dispositions for inquire-based  
learning environments.
EMS 470 Methods and Materials for Teaching Mathematics 3. 
Prerequisite: Admission to professional semester.
Purposes, methods, curricula and evaluation practices for teaching mathematics in middle school and high school. Taught during the first seven weeks of the semester.

EMS 471 Student Teaching in Mathematics 1-12.
Prerequisite: Admission to professional semester, Corequisite: EMS 470.
Supervised experience in a selected middle or secondary school for the semester, to develop and practice the skills and techniques for teaching mathematics. Students are required to provide their own transportation. MED, MSM and MSD majors only.

EMS 472 Teaching Mathematics Topics in Senior High School 3.
Prerequisite: EMS 480 passed with a C or better.
Preparation for teaching mathematics from both the college repertoire (algebra, geometry, trigonometry, advanced mathematics) and general courses (pre-algebra, technical and consumer mathematics) offered in grades 9-12. This course includes a school-based field experience. Students are required to provide their own transportation. MED Majors only.

EMS 473 Teaching Mathematics Topics in the Middle Grades 3.
Prerequisite: EMS 480 passed with a C or better.
Methods of teaching arithmetic, geometry, algebra, and pre-algebra topics in grades 6-9. Emphasizes approaches that actively involve learners and relate operations on concrete and pictorial representations to mathematical symbols. This course includes a school-based field experience. Students are required to provide their own transportation. MSM Majors only.

EMS 474 Methods of Teaching Science II 3.
Prerequisite: EMS 375.
Goals, methods, curricula, and evaluation practices in teaching the physical and biological sciences at the middle and secondary school levels. Taught during the fall.

EMS 475 Methods of Teaching Science I 3.
Prerequisite: EMS 495.
Supervised experience in a selected middle or secondary school for the semester, to develop and practice the skills and techniques for teaching Science. Students are required to provide their own transportation. SEM and MSS majors only. Students are required to purchase internships liability insurance to participate in student teaching. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge.

EMS 480 Teaching Mathematics with Technology 3.
Prerequisite: EMS 204 with a B- or better; MA 131 or 141.
Prepares prospective mathematics teachers to use technology in their classrooms to assist students in formulating and solving math problems in the middle and high school mathematics curricula.

EMS 490 School Mathematics from an Advanced Perspective 3.
Prerequisite: MA 403 or MA 407, MA 308 or MA 408, MA 205 or MA 305 or MA 405.
This course will serve as a culminating experience for all students majoring in mathematics education and intending to become high school mathematics teachers. Course content includes functions in both secondary and collegiate mathematics, development of euclidean geometry from euclid's elements, and historical overview of algebra, and other mathematics subject matter, a trigonometry review from both triangle basis and function basis, connections between linear algebra and the high school presentation of matrices, and other topics. For Math Education majors only.

EMS 495 Senior Seminar in Mathematics and Science Education 1-3.
Prerequisite: Advanced Undergraduate standing.
In-depth investigation of one or more teaching areas in mathematics or science education.

EMS 496 Special Topics in Education 1-3.
Prerequisite: Junior or senior standing.
Individual or group study of special topics in professional education. The topic and mode of study are determined by the faculty member after discussion with the student.

EMS 505 Methods of Teaching Science I 3.
Graduate students new to science teaching will read current research literature that defines best practices and incorporate these practices to lesson planning that enhances student learning. Classroom, laboratory, and school-based experiences in middle and secondary science classrooms and instructional laboratories will help students to effectively prepare, plan, and assess learning environments. Emphasis placed on the development of knowledge, skills, and dispositions for inquiry-based learning environments. Underlying theoretical framework is constructivism, and experiences will be discussed using current learning theory. PBS or Graduate Standing.

EMS 506 Methods of Teaching Science II 3.
Second course in the MAT science series. Students will plan units of instruction for student teaching, and an emphasis is placed on planning for classroom management and student diversity. Current theoretical frameworks are emphasized in the context of practical field experiences. PBS or Graduate Standing.

EMS 512 Teaching and Learning Elementary and Middle Grades Mathematics 3.
Prerequisite: EMS 471.
Focus on theory, research, and methodology of teaching and learning mathematics in elementary and middle grades. Emphasizes the development of a foundation for understanding and assessing mathematical growth and learning through historical and psychological sources, research, and reflective practice. Emphasis is placed upon understanding how children come to learn elementary mathematics meaningfully and what this necessarily implies about the way mathematics is taught and how elementary and middle grades education can be improved.

EMS 513 Teaching and Learning of Algebraic Thinking 3.
Prerequisite: EMS 471 or equivalent teaching experience.
Teaching and learning of algebra from a developmental perspective; research-based methods for developing students' algebraic thinking; structure and processes used in algebra. Focus on how students develop algebraic ideas from upper elementary grades through Algebra I.
EMS 514 Teaching and Learning of Geometric Thinking 3.
Prerequisite: EMS 471 and either MA 308 or MA 408.
Focus will be on the development of geometric thinking in grades K-12 using multiple instructional approaches, including technology, and considered using different theories of learning and frameworks (e.g., Van Hiele, SOLO taxonomy). Topics may include: measurement, similarity, congruence, properties of 2 and 3 dimensional figures, circles, non-Euclidean geometries. Synthetic, analytic and transformational, formal and informal approaches will be highlighted.

EMS 519 Teaching and Learning of Statistical Thinking 3.
Prerequisite: ST 507 or ST 511.
This course is designed to bridge theory and practice on how students develop understandings of key concepts in data analysis, statistics, and probability. Discussion of students’ understandings, teaching strategies and the use of manipulatives and technology tools. Topics include distribution, measures of center and spread, sampling, sampling distribution, randomness, and law of large numbers. Must complete a first level graduate statistics course (ST 507, ST 511, or equivalent) before enrolling.

EMS 521 Advanced Methods in Science Education I 3.
Prerequisite: Graduate standing in Science Education.
Current research literature will guide the development of plans to improve classroom teaching practices. Action research used to evaluate instructional impact of modifications to classroom strategies. What it means to teach science, what it means to teach a diverse population of students and how to develop, interpret, and implement alternative assessment.

EMS 522 Advanced Methods in Science Education II 3.
Prerequisite: EMS 521 and graduate standing in Science Education.
Examines science instruction through analysis of curricula, instructional practices, current research on science learning and teaching. Five areas of interest: curriculum, instruction, assessment, diversity, learning environments and technology in science education.

EMS 531 Introduction to Research in Science Education 3.
Prerequisite: Graduate standing in Science Education.
Introduction to techniques and designs specific to and/or in the context of science education research. Analyze and critique findings of other science education researchers in current science education research literature. Perform and interpret quantitative and qualitative analyses commonly used in science education research. Carry out research project focusing on an aspect of science education, communicate research findings in both oral and written form.

EMS 570 Methods and Materials for Teaching Mathematics 3.
Purposes, methods, curricula and evaluation practices for teaching mathematics in middle school and high school. Taught during the first seven weeks of the semester. Credit for both EMS 470 and EMS 570 is not allowed.

EMS 572 Teaching Mathematics Topics in Senior High School 3.
Preparation for teaching mathematics from both the college preparatory (algebra, geometry, trigonometry, advanced mathematics) and general courses (pre-algebra, technical and consumer mathematics) in grades 9-12. Credit for both EMS 472 and EMS 572 not allowed.

Prerequisite: Graduate standing or alternative license program.
Project-based course to improve the understanding and use of technology tools useful in science teaching. Computer and calculator based laboratory probeware and software, imaging and presentation technologies. Research-based evaluation of tool use in the science laboratory and classroom.

EMS 575 Foundations Of Science Education 3.
Prerequisite: EMS 475.
Study and analysis of philosophical, historical, sociological, political and economic factors affecting science education in schools of the U.S. Implications for science education of various learning theories along with models for curriculum development and program planning. Critical analysis of current trends, issues and problems in science education in terms of multiple perspectives.

EMS 577 Improving Classroom Instruction In Science 3.
Prerequisite: EMS 475.
Application of major principles of education and psychology to improvement of science teaching in elementary, middle and secondary schools. Emphasis on critical analysis of research and the development of research-based classroom applications. Goals and objectives of science teaching, instructional strategies, development or selection of science materials, evaluation of achievement and elements of a desirable classroom climate.

EMS 580 Teaching Mathematics with Technology 3.
Prepares mathematics teachers to use technology in their classrooms to assist students in formulating and solving math problems in the middle and high school mathematics curricula. Credit not allowed for both EMS 480 and EMS 580.

EMS 581 Advanced Applications of Technology in Mathematics Education 3.
Research-based applications of technology tools in secondary and middle school mathematics. Advanced use of various technology tools for learning and teaching mathematics, including design of technology environments, appropriate investigation tasks, and professional development.

EMS 592 Special Problems In Mathematics Teaching 1-6.
Prerequisite: EMS 471.
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

EMS 594 Special Problems In Science Teaching 1-3.
Prerequisite: EMS 476.
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

EMS 621 Special Problems In Mathematics Teaching 1-6.
Prerequisite: EMS 471.
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

EMS 622 Special Problems In Science Teaching 1-6.
Prerequisite: EMS 476.
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

EMS 630 Independent Study in EMS 1-3.
Detailed investigation of topics of particular interest to graduate students under faculty direction on a tutorial basis. Determination of credits and content by faculty member in consultation with department head.
EMS 641 Practicum In Science and Mathematics Education 1-6.
Prerequisite: EMS 770 or EMS 775.
Supervised practicum in appropriate settings both on- and off-campus. Provision for opportunity for development, implementation and evaluation in science and mathematics in clinical environment under faculty supervision.

EMS 651 Internship In Mathematics And Science Education 1-9.
Prerequisite: Nine hrs. in grad. level courses.
Utilizing the participant-observed role, required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Student required to develop possible alternative courses of action in various situations, select one of the alternatives and evaluate consequences of selected course of action.

EMS 675 Portfolio Development 1.
Techniques of portfolio construction for documenting attainment of advanced competencies in science training. For students in the last or next to last semester of coursework in the Science Education Masters Program.

EMS 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

EMS 686 Teaching In College 3.
Focus on development of competencies to perform fundamental tasks of a college teacher as well as consideration of more long-range tasks such as course development and university responsibilities of a professor. In addition to attending lectures and other types of presentations, students make video tapes of their teaching, develop tests, design introductory courses in their teaching fields and consider current issues related to university and college teaching.

EMS 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

EMS 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

EMS 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

EMS 692 Research Projects In Mathematics and Science Education 1-3.
Prerequisite: ELP 532.
A project or problem in research in education for graduate students, supervised by members of the graduate faculty. The research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

EMS 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

EMS 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

EMS 703 Teaching Mathematics and Science In Higher Education 3.
Prerequisite: EMS 770, 621 or 622, Graduate standing.
Examination of collegiate mathematics and science instruction with respect to goals and objectives, design of courses and curricula, innovative programs and facilities, and methods and materials for instruction.

EMS 704 Curriculum Development and Evaluation In Science and Mathematics 3.
Prerequisite: 500-level statistics, PSY 535.
Critical study of elements of curriculum design and theory in mathematics education and science education and examination of evaluation procedures for assessing educational innovations.

EMS 705 Education and Supervision Of Teachers Of Mathematics and Science 3.
Prerequisite: EMS 770 or 621 or 622.
Critical analysis of theories, programs and techniques designed to promote interpersonal interactions leading to more effective teaching of science and mathematics.

EMS 711 Research on the Teaching and Learning of Math at Secondary and Early College Levels 3.
This course familiarizes students with theories and research related to mathematical thinking, learning and teaching at the secondary and early college levels with a focus on the following topics: function, expressions and equations, geometry, proof, limit, calculus, differential equations, and linear algebra. Students will apply theories to analyze secondary and freshmen/sophomore standing mathematical thinking, synthesize research findings, explain difficulties students experience, and design and conduct research. Restriction: at least 18 hrs of 400-500 level mathematics and a PhD student in Mathematics Education.
EMS 712 Teaching Mathematics In Elementary and Junior High School 3.
Prerequisite: EMS 471.
Comprehensive study of teaching mathematics in elementary and junior high schools. Major emphasis on building skills in teaching arithmetic, elementary algebra and intuitive geometry. Thorough search of literature relative to mathematics curricula conducted, designing and sequencing of learning activities, teaching mathematical concepts and relationships, building skill in computation, reading mathematics, problem solving and measurement.

EMS 730 Trends and Issues in Science Education 3.
Prerequisite: Graduate standing.
Provides an in-depth examination and analysis of literature and research in science education as well as current trends in science education reform. Emphasis is placed on the analysis of theoretical models of inquiry. Course includes the development of a review of literature and the formation of research questions specific to science education.

EMS 731 Fundamentals of Research in Science Education: Qualitative and Quantitative Inq 3.
Prerequisite: Graduate standing and ST 507 or 511, Corequisite: ST 508 or 512.
Analyze the range of research designs currently utilized by science education researchers. Develop an understanding of the assumptions and frameworks of different types of inquiry in science education. A brief history of research in science education is examined as a means to orient students to the trends that have taken place. Read, comprehend, and critically analyze qualitative and quantitative designs in science education.

EMS 732 Theoretical and Critical Perspectives of Science Education 3.
Prerequisite: Graduate standing.
Examines current theoretical and critical perspectives of science education. Examines a variety of approaches which re-assess cultural notions of meaning, identity, power, and representation in the sciences and science education. Applies research theory to reform in science education.

EMS 770 Foundations Of Mathematics Education 3.
Prerequisite: EMS 471.
The current status of mathematics education with special emphasis on study and critical analysis of current practices in mathematics instruction from elementary school through college.

EMS 775 Foundations Of Science Education 3.
Prerequisite: EMS 475.
Study and analysis of philosophical, historical, sociological, political and economic factors affecting science education in schools of the U.S. Implications for science education of various learning theories along with models for curriculum development and program planning. Critical analysis of current trends, issues and problems in science education in terms of multiple perspectives.

EMS 777 Improving Classroom Instruction In Science 3.
Prerequisite: EMS 475.
Application of major principles of education and psychology to improvement of science teaching in elementary, middle and secondary schools. Emphasis on critical analysis of research and the development of research-based classroom applications. Goals and objectives of science teaching, instructional strategies, development or selection of science materials, evaluation of achievement and elements of a desirable classroom climate.

EMS 786 Teaching in College 3.
Focus on development of competencies to perform fundamental tasks of a college teacher as well as consideration of more long-range tasks such as course development and university responsibilities of a professor. In addition to attending lectures and other types of presentations, students make video tapes of their teaching, develop tests, design introductory courses in their teaching fields and consider current issues related to university and college teaching.

EMS 792 Special Problems in Math Teaching 3-6.
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

EMS 794 Special Problems in Science Teaching 3-6.
Prerequisite: EMS 476.
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

EMS 802 Seminar In Mathematics Education 1-12.
Prerequisite: Departmental Majors.
In-depth examination and analysis of literature and research in a particular topic(s) in mathematics education.

EMS 803 Seminar In Science Education 2.
Prerequisite: Departmental Majors.
In-depth examination and analysis of literature and research in a particular topic(s) in science education.

EMS 821 Special Problems In Mathematics Teaching 1-6.
Prerequisite: EMS 471.
In-depth investigation of topical problems in mathematics teaching chosen from areas of curriculum, methodology, technology, supervision and research.

EMS 822 Special Problems In Science Teaching 1-6.
Prerequisite: EMS 476.
In-depth investigation of topics in science education not covered in existing courses. Includes critical analysis of research and may include field work. May be offered on individual basis or as a class.

EMS 832 Research Applications in Science Education 3.
Prerequisite: EMS 730, EMS 731, ST 508.
Provides students with the opportunity to design science education research including formulating research questions, designing the methodologies to be used in the study, selecting assessments and protocols, and identifying appropriate analyses. Theoretical frameworks and associated assumptions are identified and critiqued. Develop advanced skills in reviewing different types of science education research and identifying issues of validity and reliability.

EMS 841 Practicum In Science and Mathematics Education 1-6.
Prerequisite: EMS 770 or EMS 775.
Supervised practicum in appropriate settings both on- and off-campus. Provision for opportunity for development, implementation and evaluation in science and mathematics in clinical environment under faculty supervision.
EMS 851 Internship In Mathematics and Science Education 1-9. 
Prerequisite: Nine hrs. in grad. level courses.
Utilizing the participant-observer role, required participation in selected educational situations with emphasis upon development of observational skills, ability to record relevant observations by means of written journals, skills in analyzing experiences identifying critical incidents and projection of events and consequences. Student required to develop possible alternative courses of action in various situations, select one of the alternatives and evaluate consequences of selected course of action.

EMS 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

EMS 890 Doctoral Preliminary Exam 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

EMS 892 Research Projects In Mathematics and Science Education 1-3.
Prerequisite: ELP 532.
A project or problem in research in education for graduate students, supervised by members of the graduate faculty. The research chosen on basis of individual students' interests and not to be part of thesis or dissertation research.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

EMS 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Mathematical Sciences (MSGE)

MSGE - MSGE Courses

MSGE 295 Mathematical Sciences Special Topics 3.
Special topics course offering for the general education Mathematical Sciences category.

Mathematics (MA)

MA - Mathematics Courses

Preparation for MA 103, MA 105, MA 107, MA 111, and MA 114.
Reviews main topics from high school Algebra I and Algebra II emphasizing functions and problem solving. Other concepts and skills covered include algebraic operations, factoring, linear equations, graphs, exponents, radicals, complex numbers, quadratic equations, radical equations, inequalities, systems of equations, compound inequalities, absolute value in equations and inequalities. MA 101 may not be counted as credit toward meeting graduation. Credit for MA 101 is not allowed if student has prior credit in any other mathematical course.

MA 103 Topics in Contemporary Mathematics 3.
Prerequisite: MA 101 or equivalent completed in high school.
Primarily for students in Humanities and Social Sciences. Illustrations of contemporary uses of mathematics, varying from semester to semester, frequently including sets and logic, counting procedures, probability, modular arithmetic, and game theory.

MA 103A Topics in Contemporary Mathematics 3.
AGI Only and MA 102.
Primarily for students in Humanities and Social Sciences. Illustrations of contemporary uses of mathematics, varying from semester to semester, frequently including sets and logic, counting procedures, probability, modular arithmetic, and game theory.

MA 105 Mathematics of Finance 3.
Prerequisite: MA 101 or equivalent completed in high school.
Simple and compound interest, annuities and their application to amortization and sinking fund problems, installment buying, calculation of premiums of life annuities and life insurance.

MA 107 Precalculus I 3.
Prerequisite: C- or better in MA 101, or a 450 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test.
Algebra and basic trigonometry; polynomial, rational, exponential, logarithmic and trigonometric functions and their graphs. Credit for MA 107 does not count toward graduation for students in Engineering, College of Sciences, Bio and Ag Engineering (Science Program), Bio Sci (all options), Math Edu, Sci Edu, Textiles, and B.S. degrees in CHASS. Credit is not allowed for both MA 107 and MA 111.

MA 108 Precalculus II 3.
Prerequisite: C- or better in MA 107.
Algebra, analytic geometry and trigonometry; inequalities, conic sections, complex numbers, sequences and series, solving triangles, polar coordinates, and applications. Credit for MA 108 does not count toward graduation for students in Engineering, College of Sciences, Design, Bio and Ag Engineering (Science Program), Bio Sci (all options), Math Edu, Sci Edu, Textiles, and B.S. degrees in CHASS. Credit is not allowed for both MA 108 and MA 111. Also, MA 108 should not be counted toward the GER mathematical sciences.

Math in Agriculture and Related Sciences (MAA)

MAA - Math in Agriculture and Related Sciences Courses

MAA 102 Mathematics in Agriculture and Related Sciences 3.
Develops the ability to utilize skills and technology to solve problems at a level found in non-mathematics-intensive programs. Topics include applications to percent, ratio and proportions, formulas, algebra and solutions to linear equations and the elements of plane geometry. Applications include, but are not limited to, business, finance and agriculture. Restricted to Agricultural Institute Students only. C-Wall course; Prerequisite for MA 103, Topics in Contemporary Math.
MA 111 Precalculus Algebra and Trigonometry 3.
Prerequisite: C- or better in MA 101, or 480 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test.1
Real numbers, functions and their graphs (special attention to polynomial, rational, exponential, logarithmic, and trigonometric functions), analytic trigonometry. Credit in MA 111 does not count toward graduation for students in Engr., College of Sciences, Design, Biological & Ag. Engr. (Science Program), Biological Sci.(all options), Math. Edu., Forestry, & Textiles. Credit is not allowed for both MA 111 and either MA 107 or MA 108.

MA 114 Introduction to Finite Mathematics with Applications 3.
Prerequisite: MA 101 or equivalent completed in high school.
Elementary matrix algebra including arithmetic operations, inverses, and systems of equations; introduction to linear programming including simplex method; sets and counting techniques, elementary probability including conditional probability; Markov chains; applications in the behavioral, managerial and biological sciences. Computer use for completion of assignments.

MA 116 Introduction to Scientific Programming (Math) 3.
Prerequisite: MA 141, and either COS 100 or E 115; Corequisite: MA 241.
Computer-based mathematical problem solving and simulation techniques using MATLAB. Emphasizes scientific programming constructs that utilize good practices in code development, including documentation and style. Covers user-defined functions, data abstractions, data visualization and appropriate use of pre-defined functions. Applications are from science and engineering. Prerequisites: MA 141 and either PMS 100 or E 115. Corequisite: MA 241.

MA 121 Elements of Calculus 3.
Prerequisite: MA 107 or 111 with a C- or better, or 480 on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 121 and MA 131 or MA 141.
For students who require only a single semester of calculus. Emphasis on concepts and applications of calculus, along with basic skills. Algebra review, functions, graphs, limits, derivatives, integrals, logarithmic and exponential functions, functions of several variables, applications in management, applications in biological and social sciences. Credit is not allowed for more than one of MA 121, 131, 141. MA 121 may not be substituted for MA 131 or MA 141 as a curricular requirement.

MA 131 Calculus for Life and Management Sciences A 3.
Prerequisite: C- or better in MA 107 or MA 111, or 520 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 131 and MA 121 or MA 141.
First order finite difference models; derivatives - limits, power rule, graphing, and optimization; exponential and logarithmic functions - growth and decay models; integrals - computation, area, total change; applications in life, management, and social sciences. Credit not allowed for more than one of MA 121, 131, and 141.

MA 132 Computational Mathematics for Life and Management Sciences 1.
Prerequisite: C- or better in MA 121 or MA 131.
Computational aspects of calculus for the life and management sciences; use of spreadsheets and a computer algebra system; applications to data models, differential equation models, and optimization.

MA 141 Calculus I 4.
Prerequisite: MA 111 or MA 108 with grade of C- or better, or 550 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 141 and MA 121 or MA 131.
First of three semesters in a calculus sequence for science and engineering majors. Functions, graphs, limits, derivatives, rules of differentiation, definite integrals, fundamental theorem of calculus, applications of derivatives and integrals. Use of computation tools. Credit is not allowed for more than one of MA 141, 131, 121.

MA 151 Calculus for Elementary Education I 3.
Prerequisite: C- or better in MA 107 or MA 111, or 520 or better on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both MA 131 and MA 121 or MA 141.
Calculus for Elementary Education I is the first semester of a two semester sequence of courses designed for the Elementary Education Program. Topics include sequences, limit, and derivative. Also, topics related to teaching elementary mathematics will be discussed. Students cannot receive credit for more than one of MA 151, MA 121, MA 131, or MA 141. MA 151 is not an accepted prerequisite for MA 231 and MA 241. This course is restricted to Elementary Education majors only.

MA 152 Calculus for Elementary Education II 3.
Prerequisite: MA 151.
Calculus for Elementary Education II is the second semester of a two semester sequence of courses designed for the Elementary Education Program. Topics will include derivative, integrals, difference equations, and differential equations. Also, topics related to teaching elementary mathematics will be discussed. This course is restricted to Elementary Education majors only. Students cannot receive credit for both MA 152 and MA 121, MA 131, or MA 141. MA 152 is not an accepted prerequisite for MA 241.

MA 205 Elements of Matrix Computations 3.
Prerequisite: C- in MA 121, 131, or 141.
Complex numbers and Euler's formula. Vectors in 2-D and 3-D, lines, planes, vector products and determinants. Vectors in n-D, matrices and matrix products. Algebraic systems, row operations, inverse matrices and LU factors. Least squares, undetermined systems and null and column spaces. Applications to linear systems of differential equations and/or to visualization and image filters. Emphasis is on by-hand computations, but it is to include applications and computing tools. Students cannot receive credit for more than one of MA 205, MA 305, or MA 405.

MA 225 Foundations of Advanced Mathematics 3.
Prerequisite: MA 241.
Introduction to mathematical proof with focus on properties of the real number system. Elementary symbolic logic, mathematical induction, algebra of sets, relations, functions, countability. Algebraic and completeness properties of the reals.

MA 231 Calculus for Life and Management Sciences B 3.
Prerequisite: MA 131 or MA 141; Credit is not allowed for both MA 231 and MA 241.
Differential equations - population growth, flow processes, finance and investment models, systems; functions of several variables - partial derivatives, optimization, least squares, multiple integrals; Lagrange multiplier method - chain rule, gradient; Taylor polynomials and series; numerical methods. MA 121 is not an accepted prerequisite for MA 231.
MA 241 Calculus II 4.
Prerequisite: MA 141 with grade of C- or better or AP Calculus credit.
Credit is not allowed for both MA 241 and MA 231.
Second of three semesters in a calculus sequence for science and engineering majors. Techniques and applications of integration, elementary differential equations, sequences, series, power series, and Taylor's Theorem. Use of computational tools.

MA 242 Calculus III 4.
Prerequisite: MA 241 with grade of C- or better or AP Calculus credit, or Higher Level IB credit.

MA 302 Numerical Applications to Differential Equations 1.
Prerequisite: MA 241.
Numerical methods for approximating solutions for differential equations, with an emphasis on Runge-Kutta-Fehlberg methods with stepsize control. Applications to population, economic, orbital and mechanical models.

MA 303 Linear Analysis 3.
Prerequisite: MA 241.
Linear difference equations of first and second order, compound interest and amortization. Matrices and systems of linear equations, eigenvalues, diagonalization, systems of first and second order equations, transform methods, population problems. Credit not allowed if credit has been obtained for MA 341 or MA 405.

MA 305 Introductory Linear Algebra and Matrices 3.
Prerequisite: MA 241 or MA 231 with MA 132.
The course is an elementary introduction to matrix theory and linear algebra. Emphasis is given to topics that will be useful in other disciplines, including systems of equations, Euclidean vector spaces, determinants, eigenvalues and eigenvectors, linear transformations, similarity, and applications such as numerical solutions of equations and computer graphics. Compares with MA 405 Introductory Linear Algebra, more emphasis is placed on methods and calculations. Credit is not allowed for both MA 305 and MA 405.

Prerequisite: MA 116, MA 141, MA 241; Corequisite: MA 242.
For sophomore meteorology and marine science students. A complement to MA 242 designed to prepare students for quantitative atmospheric applications. Topics include an introduction to vectors and vector calculus, atmospheric waves, phase and group velocity, perturbation analysis, fourier decomposition, matrix operations, chaos and predictability. For MY, MMY, and MRM majors only.

MA 325 Introduction to Applied Mathematics 3.
Prerequisite: (MA 231 or MA 242) and (MA 116 or CSC 112 or CSC 114 or CSC 116).
Introduces students with multivariable calculus to five different areas of applied mathematics. These areas will be five three-week modules, which lead to higher level courses in the application areas. Topics will vary, and examples of modules are heat and mass transfer, biology and population, probability and finance, acoustic models, cryptography as well as others.

MA 331 Differential Equations for the Life Sciences 3.
P: MA 231 or MA 241; X: Credit cannot be given for both MA 341 and MA 331.
This course provides students with an understanding of how mathematics and life sciences can stimulate and enrich each other. The course topics include first order differential equations, separable equations, second order systems, vector and matrix systems, eigenvectors/ eigenvalues, graphical and qualitative methods. The methods are motivated with examples from the biological sciences (growth models, kinetics and compartmental models, epidemic models, predator-prey, etc). Computational modeling will be carried out using SimBiology, a MATLAB toolbox based graphical user interface, which which automates and simplifies the process of modeling biological systems. Credit cannot be given for both MA 341 and MA 331.

MA 335 Symbolic Logic 3.
Prerequisite: LOG 201 or MA 225.
Intermediate level introduction to modern symbolic logic focusing on standard first-order logic; topics include proofs, interpretations, applications and basic metalogical results.

Prerequisite: MA 242 or (MA 132 and MA 231).

MA 351 Introduction to Discrete Mathematical Models 3.
Prerequisite: MA 224, 225, 231 or 241.
Basic concepts of discrete mathematics, including graph theory, Markov chains, game theory, with emphasis on applications; problems and models from areas such as traffic flow, genetics, population growth, economics, and ecosystem analysis.

MA 401 Applied Differential Equations II 3.
Prerequisite: MA 341; Credit not allowed for both MA 401 and MA 501.
Wave, heat and Laplace equations. Solutions by separation of variables and expansion in Fourier Series or other appropriate orthogonal sets. Sturm-Liouville problems. Introduction to methods for solving some classical partial differential equations. Use of power series as a tool in solving ordinary differential equations. Credit for both MA 401 and MA 501 will not be given.

P: (MA 341 or MA 405) and programming proficiency (MATLAB, C++, Java, Fortran, or other language).
This course will provide an overview of methods to solve quantitative problems and analyze data. The tools to be introduced are mathematical in nature and have links to Algebra, Analysis, Geometry, Graph Theory, Probability and Topology. Students will acquire an appreciation of (I) the fundamental role played by mathematics in countless applications and (II) the exciting challenges in mathematical research that lie ahead in the analysis of large data and uncertainties. Students will work on a project for each unit. While this is not a programming class, the students will do some programming through their projects.

MA 403 Introduction to Modern Algebra 3.
Prerequisite: MA 225.
Sets and mappings, equivalence relations, rings, integral domains, ordered integral domains, ring of integers. Other topics selected from fields, polynomial rings, real and complex numbers, groups, permutation groups, ideals, and quotient rings. Credit is not allowed for both MA 403 and MA 407.
MA 405 Introduction to Linear Algebra 3. 
Prerequisite: MA 241 (MA 225 recommended); Corequisite: MA 407 is recommended.
This course offers a rigorous treatment of linear algebra, including systems of linear equations, matrices, determinants, abstract vector spaces, bases, linear independence, spanning sets, linear transformations, eigenvalues and eigenvectors, similarity, inner product spaces, orthogonality and orthogonal bases, factorization of matrices. Compared with MA 305 Introductory Linear Algebra, more emphasis is placed on theory and proofs. MA 225 is recommended as a prerequisite. Credit is not allowed for both MA 305 and MA 405.

Prerequisite: MA 225 and MA 405.
Elementary number theory, equivalence relations, groups, homomorphisms, cosets, Cayley's Theorem, symmetric groups, rings, polynomial rings, quotient fields, principal ideal domains, Euclidean domains. Credit is not allowed for both MA 403 and MA 407.

MA 408 Foundations of Euclidean Geometry 3. 
Prerequisite: MA 225.
An examination of Euclidean geometry from a modern perspective. The axiomatic approach with alternative possibilities explored using models.

MA 410 Theory of Numbers 3. 
Prerequisite: One year of calculus.
Arithmetic properties of integers. Congruences, arithmetic functions, diophantine equations. Other topics chosen from quadratic residues, the quadratic reciprocity Law of Gauss, primitive roots, and algebraic number fields.

MA 412 Long-Term Actuarial Models 3. 
Prerequisite: MA 241 or MA 231, Corequisite: MA 421, BUS(ST) 350, ST 301, ST 305, ST 311, ST 361, ST 370, ST 371, ST 380 or equivalent.
Long-term probability models for risk management systems. Theory and applications of compound interest, probability distributions of failure time random variables, present value models of future contingent cash flows, applications to insurance, health care, credit risk, environmental risk, consumer behavior and warranties.

MA 413 Short-Term Actuarial Models 3. 
Prerequisite: MA 241 or MA 231, and one of MA 421, ST 301, ST 305, ST 370, ST 371, ST 380, ST 421.
Short-term probability models for risk management systems. Frequency distributions, loss distributions, the individual risk model, the collective risk model, stochastic process models of solvency requirements, applications to insurance and businesses decisions.

MA 416 Introduction to Combinatorics 3. 
Prerequisite: MA 225 or CSC 226.
Basic principles of counting: addition and multiplication principles, generating functions, recursive methods, inclusion-exclusion, pigeonhole principle; basic concepts of graph theory: graphs, digraphs, connectedness, trees; additional topics from: Polya theory of counting, Ramsey theory; combinatorial optimization - matching and covering, minimum spanning trees, minimum distance, maximum flow; sieves; mobius inversion; partitions; Gaussian numbers and q-analogues; bijections and involutions; partially ordered sets.

MA 421 Introduction to Probability 3. 
Prerequisite: MA 242.
Axioms of probability, conditional probability and independence, basic combinatorics, discrete and continuous random variables, joint densities and mass functions, expectation, central, limit theorem, simple stochastic processes.

MA 425 Mathematical Analysis I 3. 
Prerequisite: MA 225 (MA 407 desirable).
Real number system, functions and limits, topology on the real line, continuity, differential and integral calculus for functions of one variable. Infinite series, uniform convergence. Credit is not allowed for both MA 425 and MA 511.

MA 426 Mathematical Analysis II 3. 
Prerequisite: MA 425 and 405.
Calculus of several variables, topology in n-dimensions, limits, continuity, differentiability, implicit functions, integration. Credit is not allowed for both MA 426 and MA 512.

MA 427 Introduction to Numerical Analysis I 3. 
Prerequisite: MA 341 or 301 and programming language proficiency.
Theory and practice of computational procedures including approximation of functions by interpolating polynomials, numerical differentiation and integration, and solution of ordinary differential equations including both initial value and boundary value problems. Computer applications and techniques.

MA 428 Introduction to Numerical Analysis II 3.
Prerequisite: MA 405 or MA 305 and programming language proficiency.
Computational procedures including direct and iterative solution of linear and nonlinear equations, matrices and eigenvalue calculations, function approximation by least squares, smoothing functions, and minimax approximations.

MA 430 Mathematical Models in the Physical Sciences 3. 
Prerequisite: MA 341 and MA 405.
Application of mathematical techniques to topics in the physical sciences. Problems from such areas as conservative and dissipative dynamics, calculus of variations, control theory, and crystallography.

MA 432 Mathematical Models in Life and Social Sciences 3. 
Prerequisite: MA 421, (MA 305 or MA 405), and programming proficiency; Corequisite: (MA 421 or ST 371).
Topics from differential and difference equations, probability, and matrix algebra applied to formulation and analysis of mathematical models in biological and social science (e.g., population growth).

MA 437 Applications of Algebra 3. 
Prerequisite: MA 403 or 407, MA 405.
Error correcting codes, cryptography, crystallography, enumeration techniques, exact solutions of linear equations, and block designs.

MA 440 Game Theory 3. 
Prerequisite: MA 231 or MA 242.
Game Theory as a language for modeling situations involving conflict and cooperation in the social, behavioral, economic, and biological sciences. Backward induction; dominated strategies; Nash equilibria; games with incomplete information; repeated games; evolutionary dynamics.

MA 444 Problem Solving Strategies for Competitions 1.
Analyze the most common problem-solving techniques and illustrate their use by interesting examples from past Putnam and Virginia Tech math competitions. Problem solving methods are divided into groups and taught by professors of the math department. After the lecture, students practice writing the solutions for the assignment and have informal discussions in the next class.

MA 450 Methods of Applied Mathematics I 3. 
Prerequisite: MA 341.
Mathematical methods covered include dimensional analysis, asymptotics, continuum modeling and traffic flow analysis. These topics are discussed in the context of applications and real data. This course is independent of MA 451 Methods of Applied Mathematics II.
MA 451 Methods of Applied Mathematics II 3.  
Prerequisite: MA 341.  
The mathematical methods of this course give insight into physical continuum processes such as fluid flow and the deformation of solid elastic materials. Techniques include the modeling and formulation of equations of motion, the use of Lagrangian and Eulerian variables; further topics are: examples of incompressible fluid flow, calculus of variations and applications to optimal control problems. This course is independent of MA 450 Methods of Applied Mathematics I.

MA 491 Reading in Honors Mathematics 1-6.  
Prerequisite: Membership in honors program.  
A reading (independent study) course available as an elective for students participating in the mathematics honors program.

MA 493 Special Topics in Mathematics 1-6.  
Directed individual study or experimental course offerings.

MA 494 Major Paper in Math 1.  
Corequisite: MA class at the 400-level or above.  
Introduces students to one or more forms of writing used in scientific and research environments. Students are required to take a companion math course at the 400-level or above, and adapt writing assignment(s) to the topics in the companion course. Instruction covers all phases of the writing process (planning, drafting, revising, and critiquing other people's work). Emphasis is placed on organizing for needs of a variety of readers; concise, clear expression.

MA 499 Independent Research in Mathematics 1-6.  
Study and research in mathematics. Topics for theoretical, modeling or computational investigation. Consent of Department Head. Honors Program should enroll in MA 491H. At most 6 hours total of MA 499 and 491H credit can be applied towards an undergraduate degree. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

MA 501 Advanced Mathematics for Engineers and Scientists I 3.  
Prerequisite: MA 341; credit not allowed for both MA 501 and MA 401.  
Survey of mathematical methods for engineers and scientists. Ordinary differential equations and Green's functions; partial differential equations and separation of variables; special functions, Fourier series. Applications to engineering and science. Not for credit by mathematics majors. Credit for this course and MA 401 is not allowed.

MA 502 Advanced Mathematics for Engineers and Scientists II 3.  
Prerequisite: MA 341..  
Determinants and matrices; line and surface integrals, integral theorems; complex integrals and residues; distribution functions of probability. Not for credit by mathematics majors. Any student receiving credit for MA 502 may receive credit for, at most, one of the following: MA 405, MA 512, MA 513.

MA 504 Introduction to Mathematical Programming 3.  
Prerequisite: MA 242, MA 405.  
Basic concepts of linear, nonlinear and dynamic programming theory. Not for majors in OR at Ph.D. level.

MA 505 Linear Programming 3.  
Prerequisite: MA 405.  
Introduction including: applications to economics and engineering; the simplex and interior-point methods; parametric programming and post-optimality analysis; duality matrix games, linear systems solvability theory and linear systems duality theory; polyhedral sets and cones, including their convexity and separation properties and dual representations; equilibrium prices, Lagrange multipliers, subgradients and sensitivity analysis.

MA 507 Analysis For Secondary Teachers 3.  
Prerequisite: Graduate standing.  
A course to update and broaden secondary teacher's capability and point-of-view with respect to topics in analysis. Historical development, logical refinement and applications of concepts such as limits, continuity, differentiation and integration. May be taken for graduate credit for certificate renewal by secondary school teachers. Credit towards graduate degree may be allowed only for students in mathematics education.

MA 508 Geometry For Secondary Teachers 3.  
Prerequisite: Graduate standing.  
Topics in geometry of concern to secondary teachers in their work and provision for background and enrichment. Various approaches to study of geometry, including vector geometry, transformational geometry and axiomatics. Course may be taken for graduate credit and for certificate renewal by secondary school teachers. Credit towards a graduate degree may be allowed only for students in mathematics education.

MA 509 Abstract Algebra For Secondary Teachers 3.  
Prerequisite: Graduate standing.  
From advanced viewpoint, an investigation of topics in algebra from high school curriculum. Theory of equations, polynomial rings, rational functions and elementary number theory. Course may be taken for graduate credit for certificate renewal by secondary school teachers. Credit towards a graduate degree may be allowed only for students in mathematics education.

MA 510 Selected Topics In Mathematics For Secondary Teachers 1-6.  
Prerequisite: Graduate standing.  
Coverage of various topics in mathematics of concern to secondary teachers. Topics selected from areas such as mathematics of finance, probability, statistics, linear programming and theory of games, intuitive topology, recreational math, computers and applications of mathematics. Course may be taken for graduate credit for certification renewal by secondary school teachers. Credit towards a graduate degree may be allowed only for students in mathematics education.

MA 511 Advanced Calculus I 3.  
Prerequisite: MA 341.  
Fundamental theorems on continuous functions; convergence theory of sequences, series and integrals; the Riemann integral. Credit for both MA 425 and MA 511 is not allowed.

MA 512 Advanced Calculus II 3.  
Prerequisite: MA 341.  
General theorems of partial differentiation; implicit function theorems; vector calculus in 3-space; line and surface integrals; classical integral theorems. Credit will not be given for both MA 425 and MA 512.
MA 513 Introduction To Complex Variables 3.
Prerequisite: MA 242.
Operations with complex numbers, derivatives, analytic functions, integrals, definitions and properties of elementary functions, multivalued functions, power series, residue theory and applications, conformal mapping.

MA 515 Analysis I 3.
Prerequisite: MA 426.

MA 518 Geometry of Curves and Surfaces 3.
Prerequisite: MA 242 and MA 405.
Geometry of curves and surfaces in space; Arclength, torsion, and curvature of curves; Tangent spaces, shape operators, and curvatures of surfaces; metrics, covariant derivatives, geodesics, and holonomy. Applications in the physical sciences and/or projects using computer algebra.

MA 520 Linear Algebra 3.
Prerequisite: MA 405.

MA 521 Abstract Algebra I 3.
Prerequisite: MA 405 and MA 407.
Groups, normal subgroups, quotient groups, Cayley’s theorem, Sylow’s theorem. Rings, ideals and quotient rings, polynomial rings. Elements of field theory.

MA 522 Computer Algebra 3.
Prerequisite: MA 407 or MA 521 and MA 405 or MA 520.
Basic techniques and algorithms of computer algebra. Integer arithmetic, primality tests and factorization of integers, polynomial arithmetic, polynomial factorization, Groebner bases, integration in finite terms.

MA 523 Linear Transformations and Matrix Theory 3.
Prerequisite: MA 405.
Vector spaces, linear transformations and matrices, orthogonality, orthogonal transformations with emphasis on rotations and reflections, matrix norms, projectors, least squares, generalized inverses, definite matrices, singular values.

MA 524 Combinatorics I 3.
Prerequisite: MA 405 and MA 407.
Enumerative combinatorics, including placements of balls in bins, the twelfeifold way, inclusion/exclusion, sign-reversing involutions and lattice path enumeration. Partically ordered sets, lattices, distributive lattices, Mobius functions, and rational generating functions.

MA 526 Algebraic Geometry 3.
Prerequisite: MA 521.
Abstract theory of solutions of systems of polynomial equations. Topics covered: ideals and affine varieties, the Nullstellensatz, irreducible varieties and primary decomposition, morphisms and rational maps, computational aspects including Groebner bases and elimination theory, projective varieties and homogeneous ideals, Grassmannians, graded modules, the Hilbert function, Bezout’s theorem.

MA 528 Options and Derivatives Pricing 3.
Prerequisites: MA 341 and MA 405 and MA 421.
The course covers (i) structure and operation of derivative markets, (ii) valuation of derivatives, (iii) hedging of derivatives, and (iv) applications of derivatives in areas of risk management and financial engineering. Models and pricing techniques include Black-Scholes model, binomial trees, Monte-Carlo simulation. Specific topics include simple no-arbitrage pricing relations for futures/forward contracts; put-call parity relationship; delta, gamma, and vega hedging; implied volatility and statistical properties; dynamic hedging strategies; interest-rate risk, pricing of fixed-income product; credit risk, pricing of defaultable securities.

MA 531 Dynamic Systems and Multivariable Control I 3.
Prerequisite: MA 341, MA 405.
Introduction to modeling, analysis and control of linear discrete-time and continuous-time dynamical systems. State space representations and transfer methods. Controllability and observability. Realization. Applications to biological, chemical, economic, electrical, mechanical and sociological systems.

MA 532 Ordinary Differential Equations I 3.
Prerequisite: MA 341, 405, 425 or 511, Corequisite: MA 426 or 512.
Existence and uniqueness theorems, systems of linear equations, fundamental matrices, matrix exponential, nonlinear systems, plane autonomous systems, stability theory.

MA 534 Introduction To Partial Differential Equations 3.
Prerequisite: MA 425 or MA 511, MA 341, Corequisite: MA 426 or 512.

MA 537 Nonlinear Dynamics and Chaos 3.
Prerequisite: MA 341 and MA 405.
Usage of computer experiments for demonstration of nonlinear dynamics and chaos and motivation of mathematical definitions and concepts. Examples from finance and ecology as well as traditional science and engineering. Difference equations and iteration of functions as nonlinear dynamical systems. Fixed points, periodic points and general orbits. Bifurcations and transition to chaos. Symbolic dynamics, chaos, Sarkovski’s Theorem, Schwarzian derivative, Newton’s method and fractals.

MA 540 Uncertainty Quantification for Physical and Biological Models 3.
Prerequisite: MA 341 and basic knowledge of probability, linear algebra, and scientific computation.
Introduction to uncertainty quantification for physical and biological models. Parameter selection techniques, Bayesian model calibration, propagation of uncertainties, surrogate model construction, local and global sensitivity analysis.

MA 544 Computer Experiments In Mathematical Probability 3.
Prerequisite: MA 421.
Exposure of student to practice of performing mathematical experiments on computer, with emphasis on probability. Programming in an interactive language such as APL, MATLAB or Mathematica. Mathematical treatment of random number generation and application of these tools to mathematical topics in Monte Carlo method, limit theorems and stochastic processes for purpose of gaining mathematical insight.
MA 546 Probability and Stochastic Processes I 3.
Prerequisite: MA 421 and MA 425 or MA 511.
Modern introduction to Probability Theory and Stochastic Processes. The choice of material is motivated by applications to problems such as queueing networks, filtering and financial mathematics. Topics include: review of discrete probability and continuous random variables, random walks, markov chains, martingales, stopping times, ergodicity, conditional expectations, continuous-time Markov chains, laws of large numbers, central limit theorem and large deviations.

MA 547 Financial Mathematics 3.
Prerequisite: MA(ST) 546.

Prerequisites: (MA 421 or ST 421), MA 341, and MA 405.
Monte Carlo (MC) methods for accurate option pricing, hedging and risk management. Modeling using stochastic asset models (e.g. geometric Brownian motion) and parameter estimation. Stochastic models, including use of random number generators, random paths and discretization methods (e.g. Euler-Maruyama method), and variance reduction. Implementation using Matlab. Incorporation of the latest developments regarding MC methods and their uses in Finance.

MA 549 Financial Risk Analysis 3.
Prerequisites: MA 405 and (MA 421 or ST 421) and (MA/ST 412 or MA/ST 413).
This course focuses on mathematical methods to analyze and manage risks associated with financial derivatives. Topics covered include aggregate loss distributions, extreme value theory, default probabilities, Value-at-Risk and expected shortfall, coherent risk measures, correlation and copula, applications of principle component analysis and Monte Carlo simulations in financial risk management, how to use stochastic differential equations to price financial risk derivatives, and how to back-test and stress-test models.

MA 551 Introduction to Topology 3.
Prerequisite: MA 426.
Set theory, topological spaces, metric spaces, continuous functions, separation, cardinality properties, product and quotient topologies, compactness, connectedness.

MA 555 Introduction to Manifold Theory 3.
Prerequisite: MA 426 or MA 512.
(See MA - Mathematics.).

Prerequisite: MA 407.
Logic and axiomatic approach, the Zermelo-Fraenkel axioms and other systems, algebra of sets and order relations, equivalents of the Axiom of Choice, one-to-one correspondences, cardinal and ordinal numbers, the Continuum Hypothesis.

MA 565 Graph Theory 3.
Prerequisite: CSC 224 or MA 351.

MA 573 Mathematical Modeling of Physical and Biological Processes I 3.
Prerequisite: MA 341 and knowledge of high-level programming language.
Introduction to model development for physical and biological applications. Mathematical and statistical aspects of parameter estimation. Compartmental analysis and conservation laws, heat transfer, and population and disease models. Analytic and numerical solution techniques and experimental validation of models. Knowledge of high-level programming languages required.

MA 574 Mathematical Modeling of Physical and Biological Processes II 3.
Prerequisite: MA/BMA 573.
Model development, using Newtonian and Hamiltonian principles, for acoustic and fluid applications, and structural systems including membranes, rods, beams, and shells. Fundamental aspects of electromagnetic theory. Analytic and numerical solution techniques and experimental validation of models.

MA 580 Numerical Analysis I 3.
Prerequisite: MA 405; MA 425 or MA 511; high-level computer language.
Algorithm behavior and applicability. Effect of roundoff errors, systems of linear equations and direct methods, least squares via Givens and Householder transformations, stationary and Krylov iterative methods, the conjugate gradient and GMRES methods, convergence of method.

MA 583 Introduction to Parallel Computing 3.
Prerequisite: CSC 302 or MA 402 or MA/CSC 428 or MA/CSC 580.
Introduction to basic parallel architectures, algorithms and programming paradigms; message passing collectives and communicators; parallel matrix products, domain decomposition with direct and iterative methods for linear systems; analysis of efficiency, complexity and errors; applications such as 2D heat and mass transfer.

Prerequisite: MA 501; knowledge of a high level programming language.
Survey of finite difference methods for partial differential equations including elliptic, parabolic and hyperbolic PDE’s. Consideration of both linear and nonlinear problems. Theoretical foundations described; however, emphasis on algorithm design and implementation.

Prerequisite: MA 501; knowledge of a high level programming language.
Introduction to finite element method. Applications to both linear and nonlinear elliptic and parabolic partial differential equations. Theoretical foundations described; however, emphasis on algorithm design and implementation.
MA 591 Special Topics 1-6.
MA 676 Master's Project 3.
Investigation of some topic in mathematics to a deeper and broader extent than typically done in a classroom situation. For the applied mathematics student the topic usually consists of a realistic application of mathematics to student's minor area. A written and oral report on the project required.

MA 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

MA 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

MA 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

MA 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged.

MA 706 Nonlinear Programming 3.
Prerequisite: OR/IE, MA 505 and MA 425.
An advanced mathematical treatment of analytical and algorithmic aspects of finite dimensional nonlinear programming. Including an examination of structure and effectiveness of computational methods for unconstrained and constrained minimization. Special attention directed toward current research and recent developments in the field.

MA 708 Integer Programming 3.
Prerequisite: MA 405, OR (MA, IE) 505, Corequisite: Some familiarity with computers (e.g., CSC 112).
General integer programming problems and principal methods of solving them. Emphasis on intuitive presentation of ideas underlying various algorithms rather than detailed description of computer codes. Students have some "hands on" computing experience that should enable them to adapt ideas presented in course to integer programming problems they may encounter.

MA 715 Analysis II 3.
Prerequisite: MA 515.

MA 716 Advanced Functional Analysis 3.
Prerequisite: MA 715.
Advanced topics in functional analysis such as linear topological spaces; Banach algebra, spectral theory and abstract measure theory and integration.

MA 719 Vector Space Methods in System Optimization 3.
Prerequisite: MA 405, 511.
Introduction to algebraic and function-analytic concepts used in system modeling and optimization: vector space, linear mappings, spectral decomposition, adjoints, orthogonal projection, quality, fixed points and differentials. Emphasis on geometric insight. Topics include least square optimization of linear systems, minimum norm problems in Banach space, linearization in Hilbert space, iterative solution of system equations and optimization problems. Broad range of applications in operations research and system engineering including control theory, mathematical programming, econometrics, statistical estimation, circuit theory and numerical analysis.

MA 720 Lie Algebras 3.
Prerequisite: MA 520, MA 521.

MA 721 Abstract Algebra II 3.
Prerequisite: MA 521.
Field extensions, Galois theory, modules, tensor products, exterior products.

MA 722 Computer Algebra II 3.
Prerequisite: MA 522.
Effective algorithms for symbolic matrices, commutative algebra, real and complex algebraic geometry, and differential and difference equations. The emphasis is on the algorithmic aspects.

MA 723 Theory of Matrices and Applications 3.
Prerequisite: MA 520 or 523.
Canonical forms, functions of matrices, variational methods, perturbation theory, numerical methods, nonnegative matrices, applications to differential equations, Markov chains.
MA 724 Combinatorics II 3.
Prerequisite: MA 524.
Polytopes(V-polytopes and H-polytopes). Fourier-Motzkin elimination, Farkas Lemma, face numbers of polytopes, graphs of polytopes, linear programming for geometors, Balinski’s Theorem, Steininitz’ Theorem, Schlegel diagrams, polyhedral complexes, shellability, and face rings.

MA 725 Lie Algebra Representation Theory 3.
Prerequisite: MA 720.

MA 731 Dynamic Systems and Multivariable Control II 3.
Prerequisite: MA 531.

MA 732 Ordinary Differential Equations II 3.
Prerequisite: MA 532, Corequisite: MA 515.
Existence-uniqueness theory, periodic solutions, invariant manifolds, bifurcations, Frenholm’s alternative.

MA 734 Partial Differential Equations 3.
Prerequisite: MA 534, Corequisite: MA 515.

MA 746 Introduction To Stochastic Processes 3.
Prerequisite: MA 405 and MA(ST) 546 or ST 521.
Markov chains and Markov processes, Poisson process, birth and death processes, queuing theory, renewal theory, stationary processes, Brownian motion.

MA 747 Probability and Stochastic Processes II 3.
Prerequisite: MA(ST) 546.
Fundamental mathematical results of probabilistic measure theory needed for advanced applications in stochastic processes. Probability measures, sigma-algebras, random variables, Lebesgue integration, expectation and conditional expectations w.r.t.sigma algebras, characteristic functions, notions of convergence of sequences of random variables, weak convergence of measures, Gaussian systems, Poisson processes, mixing properties, discrete-time martingales, continuous-time markov chains.

MA 748 Stochastic Differential Equations 3.
Prerequisite: MA(ST) 747.

MA 753 Algebraic Topology 3.
Prerequisite: MA 551.
Homotopy, fundamental group, covering spaces, classification of surfaces, homology and cohomology.

MA 755 Introduction To Riemannian Geometry 3.
Prerequisite: MA 555.
Tensor algebra on vector spaces and tensor fields on manifolds; Koszul connections; parallel transport; torsion and curvature of connections; the Bianchi identities; metric tensor fields; metric and Levi-Civita connections; the Riemannian curvature, Ricci and Einstein tensors. Special topics: general relativity, embedding theory, integration on manifolds, the Gauss-Bonnet theorem, De Rahm cohomology.

MA 766 Network Flows 3.
Prerequisite: OR(IE,MA) 505.
Study of problems of flows in networks. These problems include the determination of shortest chain, maximal flow and minimal cost flow in networks. Relationship between network flows and linear programming developed as well as problems with nonlinear cost functions, multi-commodity flows and problem of network synthesis.

MA 771 Biomathematics I 3.
Prerequisite: Advanced calculus, reasonable background in biology.
Role of theory construction and model building in development of experimental science. Historical development of mathematical theories and models for growth of one-species populations (logistic and offshoots), including considerations of age distributions (matrix models, Leslie and Lopez; continuous theory, renewal equation). Some of the more elementary theories on the growth of organisms (von Bertalanffy and others; allometric theories; cultures grown in a chemostat).
Mathematical theories oftwo and more species systems (predator-prey, competition, symbiosis; leading up to present-day research) and discussion of some similar models for chemical kinetics. Much emphasis on scrutiny of biological concepts as well as of mathematical structureof models in order to uncover both weak and strong points of models discussed. Mathematical treatment of differential equations in models stressing qualitative and graphical aspects, as well as certain aspects of discretization. Difference equation models.

MA 772 Biomathematics II 3.
Prerequisite: BMA 771, elementary probability theory.
Continuation of topics of BMA 771. Some more advanced mathematical techniques concerning nonlinear differential equations of types encountered in BMA 771: several concepts of stability, asymptotic directions, Liapunov functions; different time-scales. Comparison of deterministic and stochastic models for several biological problems including birth and death processes. Discussion of various other applications of mathematics to biology, some recent research.

MA 773 Stochastic Modeling 3.
Prerequisite: BMA 772 or ST (MA) 746.

Prerequisite: BMA 771 or MA/OR 731; BMA 772 or MA 401 or MA 501.
MA 779 Advanced Probability 3.
Prerequisite: MA 425 and ST 521.
Sets and classes, sigma-fields and related structures, probability measures and extensions, random variables, expectation and integration, uniform integrability, inequalities, L_p-spaces, product spaces, independence, zero-one laws, convergence notions, characteristic functions, simplest limit theorems, absolute continuity, conditional expectation and conditional probabilities, martingales.

MA 780 Numerical Analysis II 3.
Prerequisite: MA 580.
Approximation and interpolation, Fast Fourier Transform, numerical differentiation and integration, numerical solution of initial value problems for ordinary differential equations.

MA 784 Nonlinear Equations and Unconstrained Optimization 3.
Prerequisite: MA 580.

MA 785 Numerical Solution of Ordinary Differential Equations 3.
Prerequisite: MA 511 or 512.
Numerical methods for initial value problems including predictor-corrector, Runge-Kutta, hybrid and extrapolation methods; stiff systems; shooting methods for two-point boundary value problems; weak, absolute and relative stability results.

Prerequisite: MA 405 or 520 and MA 501 or 534; knowledge of a high level programming language.
Nonlinear discrete equations; Newton and monotone methods for nonlinear equations; computational algorithms and applications; finite difference method-convergence, stability and error estimates; multiplicity of solutions and bifurcation; asymptotic behavior of solutions; and coupled systems of equations.

MA 790 Advanced Special Topics System Optimization 1-6.
Advanced topics in some phase of system optimization. Identification of various specific topics and prerequisite for each section from term to term.

MA 791 Special Topics In Real Analysis 1-6.

MA 792 Special Topics In Algebra 1-6.

MA 793 Special Topics In Differential Equations 1-6.

MA 796 Special Topics In Combinatorial Analysis 1-6.

MA 797 Special Topics In Applied Mathematics 1-6.

MA 798 Special Topics In Numerical Analysis 1-6.

MA 810 Special Topics 1-6.
MA 812 Special Topics in Mathematical Programming 1-6.
Prerequisite: IE(MA,OR) 505.
Study of special advanced topics in area of mathematical programming. Discussion of new techniques and current research in this area. The faculty responsible for this course select areas to be covered during semester according to their preference and interest. This course not necessarily taught by an individual faculty member but can, on occasion, be joint effort of several faculty members from this university as well as visiting faculty from other institutions. To date, a course of Theory of Networks and another on Integer Programming offered under the umbrella of this course. Anticipation that these two topics will be repeated in future together with other topics.

MA 816 Advanced Special Topics Sys Opt 1-6.
Advanced topics in some phase of system optimization. Identification of various specific topics and prerequisite for each section from term to term.

MA 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

MA 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

MA 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Mechanical & Aerospace Engr (MAE)

MAE - Mechanical Aerospace Engr Courses

MAE 200 Introduction to Mechanical Engineering Design 1.
Introduction to mechanical engineering and its application in professional practice. Includes mechanical engineering vocabulary, measurement concepts, safety training, demonstration of basic machine components and systems, dissection of mechanical engineering devices, simple drawing and sketching, 3d printing, technical communication, design, creation of Online Portfolio. (5-week course).

MAE 201 Engineering Thermodynamics I 3.
Prerequisite: MA 242, PY 208 or 202.
Introduction to the concept of energy and the laws governing the transfers and transformations of energy. Emphasis on thermodynamic properties and the First and Second Law analysis of systems and control volumes. Integration of these concepts into the analysis of basic power cycles is introduced.

MAE 206 Engineering Statics 3.
Prerequisite: Cumulative GPA 2.5 or higher and a grade of C or better in both MA 241 and PY 205.
Basic concepts of forces in equilibrium. Distributed forces, frictional forces. Inertial properties. Application to machines, structures, and systems. Credit is not allowed for both MAE 206 and CE 214.
MAE 208 Engineering Dynamics 3.  
Prerequisite: 2.5 GPA or higher, MA 242, C- or better in MAE 206 or CE 214.  
Kinematics and kinetics of particles in rectangular, cylindrical, and curvilinear coordinate systems; energy and momentum methods for particles; kinetics of systems of particles; kinematics and kinetics of rigid bodies in two and three dimensions; motion relative to rotating coordinate systems.

MAE 214 Solid Mechanics 3.  
Prerequisites: MA 242 and C- or better in (MAE 206 or CE 214).  

MAE 250 Introduction to Aerospace Engineering 1.  
The objective of this course is to introduce students to the fundamental concepts associated with aerospace engineering. This will be done through lectures focused on fluid flow, structures, dynamics, and complex system design. Students will also engage in hands-on mini-projects that will provide a design experience. Final efforts will culminate in a design portfolio project. 14AE BS Majors only.

MAE 251 Aerospace Vehicle Performance 3.  
Prerequisite: Cumulative GPA 2.5 or higher and a grade of C or better in both MA 241 and PY 205.  

MAE 252 Aerodynamics I 3.  
Prerequisites: MA 301 and C- or better in MAE 251 Corequisite: MA 341.  
Fundamentals of perfect fluid theory with applications to incompressible flows over airfoils, wings, and flight vehicle configurations.

MAE 253 Experimental Aerodynamics I 1.  
Prerequisites: MA 301 and C- or better in MAE 251; Corequisites: MA 341 and C- or better in MAE 252.  
Subsonic wind tunnel, instrumentation, data acquisition techniques, technical report preparation. Experiments involve pressure and force/moment measurements of various aerospace vehicle components with supplemental flow visualization.

MAE 302 Engineering Thermodynamics II 3.  
Prerequisites: (CSC 112 or CSC 113 or CSC 114) and C- or better in MAE 301.  
Continuation of Engineering Thermodynamics I with emphasis on the analysis of power and refrigeration cycles and the application of basic principles to engineering problems with systems involving mixtures of ideal gases, psychrometrics, nonideal gases, chemical reactions, combustion, chemical equilibrium cycle analysis, and one-dimensional compressible flow.

MAE 305 Mechanical Engineering Laboratory I 1.  
Corequisite: C- or better in (MAE 208 or CE 215).  
Theory and practice of measurement and experimental data collection. Laboratory evaluation and demonstration of components of the generalized measurement system and their effects on the final result. Applications of basic methods of data analysis as well as basic instrumentation for sensing, conditioning and displaying experimental qualities. (Instruction and practice in technical report writing.).

MAE 306 Mechanical Engineering Laboratory II 1.  
Prerequisite: MAE 305, Corequisite: MAE 310.  
Continuation of MAE 305 into specific types of measurements. Students evaluate and compare different types of instrumentation for measuring the same physical quantity on the basis of cost, time required, accuracy, etc. (Oral and written presentation of technical material).

MAE 308 Fluid Mechanics 3.  
Prerequisite: MA 242, (C- or better in MAE 208 or CE 215). Corequisite: (MA 341 or MA 301) and (MAE 301 or MSE 301).  
Development of the basic equations of fluid mechanics in general and specialized form. Application to a variety of topics including fluid statics; inviscid, incompressible fluid flow; design of Fluid dynamic system.

MAE 310 Heat Transfer Fundamentals 3.  
Prerequisite: (MA 341 or MA 301), C- or better in MAE 301. Corequisite: MA 308.  
Analysis of steady state and transient one and multidimensional heat conduction employing both analytical methods and numerical techniques. Integration of principles and concepts of thermodynamics and fluid mechanics to the development of practical convective heat transfer relations relevant to mechanical engineers. Heat transfer by the mechanism of radiation heat transfer.

MAE 315 Dynamics of Machines 3.  
Prerequisite: MA 341, C- or better in MAE 208 or CE 215.  
Application of dynamics to the analysis and design of machine and mechanical components. Motions resulting from applied loads, and the forces required to produce specified motions. Introduction to mechanical vibration, free and forced response of discrete and continuous systems.

MAE 316 Strength of Mechanical Components 3.  
Prerequisite: ME, AE, or NE Majors, C- or better in MAE 314 or CE 313.  
Analysis and design of mechanical components based on deflection, material, static strength and fatigue requirements. Typical components include beams, shafts, pressure vessels and bolted and welded joints. Classical and modern analysis and design techniques. Computer analysis using the finite element method. Material and manufacturing considerations in design.

MAE 351 Aerodynamics II 3.  
Prerequisites: C- or better in both MAE 252 and MAE 301.  
Concepts of thermodynamics, compressible fluid flow, and shock waves with application to computing the aerodynamic characteristics of airfoils, wings and flight configurations at high speed.

MAE 352 Experimental Aerodynamics II 1.  
Prerequisite: MAE 253, Corequisite: MAE 351.  
Advanced stability and control experiments in the supersonic wind tunnel and external compressible flow experiments in the supersonic wind tunnel.

MAE 356 Dynamics & Controls 3.  
Prerequisite: (MA 341 or MA 301), and C- or better in (MAE 208 or CE 215).  
Dynamics and linear feedback control of aerospace and mechanical systems. Concepts from linear system theory, kinematics, particle dynamics, first- and second-order systems, system dynamics, vibrations, and computational techniques. Feedback control root-locus, Nyquist, Bode plots, servo-mechanisms, gain and phase margin, and compensation. Control system design emphasized.
MAE 371 Aerospace Structures 1 3.
Prerequisite: C- or better in MAE 251 and (MAE 314 or CE 313).
Determination of appropriate analysis techniques for Aerospace Structures. Introduction of governing equations and selected solutions for typical structures. Use of these concepts in the design of a representative structural component.

MAE 372 Aerospace Vehicle Structures Lab 1.
Corequisite: MAE 371.
Demonstration and application of the concepts that have been presented in MAE 371 and MAE 472. Fabrication techniques and the design and construction of a structural component will be emphasized.

MAE 403 Air Conditioning 3.
Prerequisite: MAE 302, MAE 310, MAE 308.

MAE 405 Controls Lab 1.
Prerequisite: (MAE 306 or C- or better in MAE 261); Corequisite: (MAE 461 or MAE 425).
Laboratory experiments demonstrate the essential features of classical and modern control theory for single-input and single-output systems.

Prerequisite: MAE 302, MAE 310.
Application of energy conservation principles to a broad range of industrial situations with emphasis on typical equipment encountered as well as the effect of recent environmental regulations. Topics covered include: steam generators, pollution control, work minimization, heat recovery, steam traps, industrial ventilation, electrical energy management, and economics. Field trip to conduct tests and evaluate operation at three NCSU steam plants.

MAE 407 Steam and Gas Turbines 3.
Prerequisite: MAE 302 and (MAE 308 or MAE 252).
Fundamental analysis of the theory and design of turbomachinery flow passages; control and performance of turbomachinery; gas-turbine engine processes.

MAE 408 Internal Combustion Engine Fundamentals 3.
Prerequisite: MAE 302.

MAE 410 Modern Manufacturing Processes 3.
Prerequisite: MAE 316 or MAE 371.
Introduction to modern manufacturing processes and technologies. Topics to be covered include traditional machining, laser and electrochemical machining, electro-discharge machining, geometric dimensioning & tolerancing, tolerance chart, statistical process control, metal forming, metal casting, rapid prototyping, welding, micro-fabrication, hybrid processes, and computer aided manufacturing. To relate theory taught in class with practice, the course includes mini projects on machining, rapid prototyping, and material testing.

MAE 412 Design of Thermal System 3.
Prerequisite: MAE 302, MAE 308, MAE 310.
Applications of thermodynamics, fluid mechanics, and heat transfer to thermal systems with an emphasis on system design and optimization. Design of heat exchangers. Analysis of engineering economics, including time value of money, present and future worth, payback period, internal rates of return, and cost benefit analysis. Review of component model for pipes, pumps, fans, compressors, turbines, evaporators, condensers and refrigerators. Simulation methods for finding the operating point for thermal systems. Design of thermal systems through methods of optimization.

MAE 415 Analysis for Mechanical Engineering Design 3.
Prerequisite: MAE 315 and (MAE 316 or MAE 371).
Integration of the physical sciences, mathematics, and engineering to solve real-world design problems. Emphasis on open-ended problems which contain superfluous information and/or insufficient data. Solution techniques focus on problem definition, reduction to a solvable system, and development of a design response. Formal written communication of results.

MAE 416 Mechanical Engineering Design 4.
Prerequisite: MAE 415.
Teamwork, independent learning and communication skills are emphasized in this capstone course. Teams of students experience mechanical engineering design through: problem definition, investigation, brainstorming, focus, critical review, design, analysis, prototype construction and testing. Design for manufacture is encouraged throughout the process by having students build their own prototypes. Communication skills are developed through reports and presentations.

MAE 421 Design of Solar Thermal Systems 3.
Prerequisite: MAE 302, MAE 310.

MAE 430 Applied Finite Element Analysis 3.
Prerequisite: MAE 301 and (MAE 316 or MAE 371).
Finite element modeling techniques for solving real-world engineering problems are discussed. Theory of finite element discretization is highlighted follow by software implementation, emphasis is given on accurate prescription of boundary conditions that represent actual physical systems, modeling exercises and projects include solid structural problems, heat transfer, structural vibrations, fluid dynamics and contact problems, modeling is carried out using commercial software packages.

MAE 435 Principles of Automatic Control 3.
Prerequisites: (MA 301 or MA 341) and (MAE 315 or MAE 361).
Study of linear feedback control systems using transfer functions. Transient and steady state responses. Stability and dynamic analyses using time response and frequency response techniques. Compensation methods. Classical control theory techniques for determination and modification of the dynamic response of a system. Synthesis and design applications to typical mechanical engineering control systems. Introduction to modern control theory.
MAE 440 Non-Destructive Testing and Evaluation 3.  
Junior or Senior standing in the College of Engineering.  
NDT/NDE is a 3-credit elective course covering the general defect and damage types in materials and structures, principles of NDT/NDE techniques, and NDT/NDE applications. Associated lab modules (3 weeks) provide hands-on opportunities to students on often used NDT/NDE methods including magnetic particle, ultrasonics, and eddy current methods. A final project team will work on research and industrial NDT/NDE solutions.

MAE 442 Automotive Engineering 3.  
Prerequisite: MAE 302, MAE 308, MAE 315, MAE 316.  
Fundamental aspects of automotive engineering. Examines various automotive systems (engine, brakes, etc.) as well as their interactions in such areas as safety and performance. Current practices and development for the future.

MAE 451 Experimental Aerodynamics III 1.  
Prerequisite: MAE 352, Corequisite: MAE 455, MAE 458.  
Laboratory experiments in internal compressible flow and boundary layers in conjunction with MAE 455 and MAE 475. Topics include nozzle flows, constant area duct flows, component/overall performance of a gas turbine, and boundary layer analysis.

MAE 452 Aerodynamics of V/STOL Vehicles 3.  

MAE 455 Boundary Layer Theory 3.  
Prerequisite: MAE 351.  
Introduction to the Navier-Stokes Equations and boundary layer approximations for incompressible flow. Calculation techniques for laminar and turbulent boundary layer parameters which affect lift, drag, and heat transfer on aerospace vehicles. Discussions of compressible flows.

MAE 456 Computational Methods in Aerodynamics 3.  
Prerequisite: MAE 351, Corequisite: MAE 455.  
Introduction to computational methods for solving exact fluid equations. Emphasis on development of the fundamentals of finite difference methods and their application to viscous and inviscid flows.

MAE 457 Flight Vehicle Stability and Control 3.  
Prerequisite: (MAE 461 or MAE 435) and C- or better in MAE 261.  
Longitudinal, directional and lateral static stability and control of aerospace vehicles. Lineralized dynamic analysis of the motion of a six degree-of-freedom flight vehicle in response to control inputs and disturbance through use of the transfer function concept. Control of static and dynamic behavior by vehicle design (stability derivatives) and/or flight control systems.

MAE 458 Propulsion 3.  
Prerequisite: MAE 351, C- or better in MAE 301.  
One-dimensional, internal, compressible flow including: isentropic flow, normal shocks, flow with friction and simple heat addition. Applications to air-breathing aircraft propulsion systems. Performance, analysis and design of components and overall performance of air-breathing engines.

MAE 459 Rocket Propulsion 3.  
Prerequisite: MAE 351 or MAE 302.  
Study of chemical rockets. This includes nozzle theory, flight performance, thermochemical calculations, and component and system analysis and design.

MAE 467 Introduction to Space Flight 3.  
Prerequisites: (MA 301 or MA 341) and (CSC 112, CSC 113, or CSC 114) and C- or better in PY 205.  
Fundamental aspects of space flight including launch vehicle performance and design, spacecraft characteristics, two-body orbital mechanics, earth satellites, interplanetary trajectories, atmospheric entry, and atmospheric heating.

MAE 472 Aerospace Structures II 3.  
Prerequisite: MAE 371.  
A continuation of MAE 371; deflection of structures, indeterminate structures, minimum weight design fatigue analysis and use of matrix methods in structural analysis. Selection of materials for aircraft construction based on mechanical, physical, and chemical properties.

MAE 480 Aerospace Vehicle Design I 3.  
Prerequisite: Senior standing, Aerospace Engineering Majors, MAE 356, 472, 462.  
A synthesis of previously acquired theoretical and empirical knowledge and application to the design of practical aerospace vehicle systems.

MAE 481 Aerospace Vehicle Design II 3.  
Prerequisite: MAE 480.  
A continuation of MAE 480. Designs are refined and vehicles constructed and instrumented by students. A flight test program is designed and carried out in cooperation with MAE 525 students.

MAE 482 Engineering Entrepreneurship and New Product Development I 3.  
Applications of engineering, mathematics, basic sciences, finance, and business to the design and development of prototype engineering products. This course requires a complete written report and an end-of-course presentation. This is the first course in a two semester sequence. Students taking this course will implement their designed prototype in ECE 483: Senior Design Project in Electrical Engineering and Computer Engineering II-Engineering Entrepreneurs. Departmental approval required.

MAE 483 Engineering Entrepreneurship and New Product Development II 3.  
Prerequisites: ECE 301, ECE 302, ECE 303, and any two ECE specialization courses.  
Applications of engineering, science, management and entrepreneurship to the design, development and prototyping of new product ideas. Based on their own new product ideas, or those of others, students form and lead entrepreneurship teams (eTeams) to prototype these ideas. The students run their eTeams as ‘virtual’ startup companies where the seniors take on the executive roles. Joining them are students from other grade levels and disciplines throughout the university that agree to participate as eTeam members. Departmental approval required.

MAE 484 Engineering Entrepreneurship Senior Design Lab 1.  
Prerequisite: MAE/ECE 482; C: MAE/ECE 483.  
This is the lab for MAE 483. Applications of engineering, science, management, and entrepreneurship to the design, development, and prototyping of new product ideas. Based on their own product ideas, or those of others, students form and lead entrepreneurship teams (eTeams) to prototype these ideas. The students run their eTeams as ‘virtual’ startup companies where the seniors take on the executive roles. Joining them are students from other grade levels and disciplines throughout the University that agree to participate as eTeam members. Departmental approval required.

MAE 495 Special Topics in Mechanical and Aerospace Engineering 1-3.  
Offered as needed to present new or special MAE subject matter.
MAE 496 Undergraduate Project Work in Mechanical and Aerospace Engineering 1-6.
Prerequisite: Completion of all required MAE-300 level courses. Corequisite: MAE 415 or MAE 478.
Individual or small group project in engineering, comprising the design of an equipment or system stemming from a mutual student-faculty interest; a substantial final report (project) containing calculations, drawings and specifications must be produced. Alternatively, individual or small group undergraduate research evolving from a mutual student-faculty interest; a conference or scientific journal paper must be submitted for publication. Departmental approval required.

MAE 501 Advanced Engineering Thermodynamics 3.
Prerequisite: MAE 302; MA 401 or MA 511.
Classical thermodynamics of a general reactive system; conservation of energy and principles of increase of entropy; fundamental relation of thermodynamics; Legendre transformations; phase transitions and critical phenomena; equilibrium and stability criteria in different representation; irreversible thermodynamics. Introduction to statistical thermodynamics.

MAE 504 Fluid Dynamics Of Combustion I 3.
Prerequisite: MAE 301 or MAE 252 or MAE 308.

MAE 505 Heat Transfer Theory and Applications 3.
Prerequisite: MAE 310.
Development of basic equations for steady and transient heat and mass transfer processes. Emphasis on application of basic equations to engineering problems in areas of conduction, convection, mass transfer and thermal radiation.

MAE 511 Advanced Dynamics with Applications to Aerospace Systems 3.
Prerequisite: (MAE 208 or PY 205) and MA 242 and (MA 301 or MA 341).
Basic topics in advanced dynamics and with applications to aerospace systems. Rotating coordinate systems, Euler angles, three-dimensional kinematics and kinetics, angular momentum methods and an introduction to analytical mechanics. Examples are concentrated in the area of aerospace vehicles, but the methods learned will be applicable to land-based vehicles and any engineering system undergoing rigid body rotation, e.g. wind turbines, biomechanical systems, machine tools, robotic systems, etc.

MAE 513 Principles of Structural Vibration 3.
Prerequisite: MAE 315.
Principles of structural vibration beginning from single and multi-degree of freedom systems and extending to distributed systems. Forced system response, vibration of strings, bars, shafts and beams and an introduction to approximate methods.

MAE 515 Advanced Automotive Vehicle Dynamics 3.
Prerequisite: MAE 208 or MAE 315 or MAE 472 or equivalent; or consent of the instructor.
This course covers advanced materials related to mathematical models and designs in automotive vehicles as multiple degrees of freedom systems for dynamic behaviors in acceleration, braking, rollover, aerodynamics, suspensions, tire, and drive train.

MAE 518 Acoustic Radiation I 3.
Prerequisite: MA 301 and MAE 308 or MAE 356.
Introduction to principles of acoustic radiation from vibrating bodies and their related fields. The radiation of simple sources, propagation of sound waves in confined spaces and transmission through different media.

MAE 521 Linear Control and Design For Mimo Systems 3.
Prerequisite: MAE 435, MA 341.
Linear multivariable control and design for multibody engineering systems (robotics) and aircraft controls and navigation. Emphasis on multi-input and multi-output (MIMO) system analysis and design using frequency-based approach. Controllability and observability, transmission zeroes and pole-zero cancellation, eigenstructures, singular value decomposition in frequency domain, stability and performance robustness of MIMO systems.

MAE 522 Non Linear System Analysis and Control 3.
Prerequisite: MAE 521 or equivalent.
Nonlinear system analysis, Lyapunov stability theory, absolute stability, feedback linearization, sliding mode control, backstepping control technique, as well as various advanced nonlinear control methods.

MAE 525 Advanced Flight Vehicle Stability and Control 3.
Prerequisite: MAE 457.
Preliminary analysis and design of flight control systems to include autopilots and stability augmentation systems. Study of effects of inertial cross-coupling and nonrigid bodies on vehicle dynamics.

MAE 528 Experimental Flight Testing 3.
Prerequisite: Graduate standing, Aerospace Engineering Majors, MAE 525.
Application of engineering methods to experimental flight testing of fixed-wing aircraft for determination of performance and handling qualities of air vehicles. Risk minimization techniques are included in the formulation of a flight test plan. Collected flight test data is corrected for standard day and analyzed.

MAE 531 Engineering Design Optimization 3.
Prerequisite: Graduate standing in Engineering is recommended.
Nonlinear optimization techniques with applications in various aspects of engineering design. Terminology, problem formulation, single and multiple design variables, constraints, classical and heuristic approaches, single and multiobjective problems, response surface modeling, and tradeoffs in complex engineering systems. Numerical optimization algorithms and implementation of these optimization techniques. Graduate standing in engineering recommended.

MAE 532 Smart Structures and Micro-Transducers 3.
Prerequisite: MAE 314, MAE 315, or equivalent.
This course is designed for graduate students who wish to learn fundamentals and applications of smart structures and micro transducers. The course focuses on materials, structures, design, fabrication, and characterization of micro transducers. It also covers the recent progress in applications of micro transducers in aerospace, biomedical, civil, electrical and mechanical engineering.

MAE 533 Finite Element Analysis I 3.
Prerequisite: MAE 316 or MAE 472.
MAE 534 Mechatronics Design 3.
Prerequisite: Structured Programming Experience, Senior/Graduate Standing in WPS/MAE.
Principles of Mechatronics Design, review of logic gates, microprocessor architecture, sensors and actuators, A/D and D/A conversion techniques, real-time multi-tasking programming concepts, direct digital control implementation. "Hands-on" experience through several laboratory assignments and final team project.

MAE 535 Design of Electromechanical Systems 3.
Prerequisite: MA 341.
A practical introduction to electromechanical systems with emphasis on modeling, analysis, design, and control techniques. Provides theory and practical tools for the design of electric machines (standard motors, linear actuators, magnetic bearings, etc.). Involves some self-directed laboratory work and culminates in an industrial design project. Topics include Maxwell's equations, electromechanical energy conversion, finite element analysis, design and control techniques.

MAE 536 Micro/Nano Electromechanical Systems 3.
Fundamentals and applications of micro/nano sensors and actuators. Emphasis upon MEMS/NEMS design, microfabrication techniques, and case studies of MEMS devices. Nanomaterials and NEMS devices also covered. Students have opportunity to learn commercial software packages on design and simulation of MEMS and hear from experts from leading MEMS companies through guest lectures. Previous knowledge of MEMS and nanotechnology is not required. The course is restricted to advanced undergrads and graduate students in engineering, materials science, physics and biomedical fields.

MAE 537 Mechanics Of Composite Structures 3.
Prerequisite: MAE 316 or MAE 472.
Manufacturing techniques with emphasis on selection of those producing most favorable end result. Classical plate theory, materials properties and failure theories. Micromechanics, repair, plate solutions and elasticity solutions covered as required to meet special interests of students.

MAE 538 Smart Structures and Materials 3.
Prerequisite: MAE 415 or MAE 472.
An application-oriented introduction to smart structures and materials with examples from mechanical, aerospace and biomedical engineering. Experimentally observed phenomena, micromechanisms, and models for material behavior. Team work developing simulation tools for typical applications. Validating results experimentally using PC-based data acquisition systems.

MAE 539 Advanced Materials 3.
Prerequisite: MSE 201 and MAE 314.
Introduces production/structure/property/function relation and application of a number of materials mainly for biomedical, mechanical and aerospace applications. Topics include ultra light materials (production, processing and applications of cellular solids), biomaterials (classes and application of materials in medicine and dentistry), composites (classes and application), refractory materials and coatings for high temperature applications, thin film shape memory alloys for micro-electro mechanical systems (MEMS).

MAE 540 Advanced Air Conditioning Design 3.
Prerequisite: MAE 403, 404.

MAE 541 Advanced Solid Mechanics I 3.
Prerequisite: MAE 316.
Development of principles of advanced strength of materials and elasticity theory leading to solution of practical engineering problems concerned with stress and deformation analysis. Tensor analysis, coordinate transformations, alternative measures of strain, elastic constitutive equations, stress measures, formulation and solution of two and three dimensional elasticity problems. Examples include advanced beam theory for shear deformation and large deformation, contact mechanics, stress concentration, pressure vessels and compound cylinders, thermal stress analysis, and stresses in layered microelectronic devices.

MAE 543 Fracture Mechanics 3.
Prerequisite: MAE 316.
Concept of elastic stress intensity factor, Griffith energy balance, determination of the elastic field at a sharp crack tip via eigenfunction expansion methods, J integrals analysis, experimental determination of fracture toughness, fatigue crack growth, elastic-plastic crack tip fields. Emphasis on modern numerical methods for determination of stress intensity factors, critical crack sizes and fatigue crack propagation rate predictions.

MAE 544 Real Time Robotics 3.
Prerequisite: Pascal, C, FORTRAN or Assembly language experience. Real-time programming for servo control using an embedded controller. Software and hardware interfacing for control of a D.C. servo device. Introduction of multi-tasking to establish concurrent control of several processes, transforming servo loop into a process executing concurrently on single board computer. Provision for hands-on development systems and software emulators.

MAE 545 Metrology For Precision Manufacturing 3.
Prerequisite: Senior standing in MAE or BS in other curriculum.
Foundations of dimensional metrology and error analysis as applied to accuracy and repeatability in machine design. Plane, length, angle, and roundness metrology. Design of precision systems, Abbe' principle, error analysis, measurement, and compensation. Precision instruments and operating principles. Hands-on experience with measurement instruments and techniques.

MAE 546 Photonic Sensor Applications in Structure 3.
Prerequisite: MAE 371 or MAE 316.
Use of optical fiber and other photonic device based sensors to measure strain, temperature and other measurands in aerospace, mechanical, civil and biomedical applications. An introduction to optical waveguide analysis will be provided at the beginning of the course.

MAE 550 Foundations Of Fluid Dynamics 3.
Prerequisite: MAE 301 or MAE 252 or MAE 308.
Review of basic thermodynamics pertinent to gas dynamics. Detailed development of general equations governing fluid motion in both differential and integral forms. Simplification of the equations to those for specialized flow regimes. Similarity parameters. Applications to simple problems in various flow regimes.

MAE 551 Airfoil Theory 3.
Prerequisite: MAE 252.
Development of fundamental aerodynamic theory. Emphasis upon mathematical analysis and derivation of equations of motion, airfoil theory and comparison with experimental results. Introduction to super sonic flow theory.
MAE 553 Compressible Fluid Flow 3.  
Prerequisite: MAE 351 or MAE 550.  
Equations of motion in supersonic flow; unsteady wave motion, velocity potential equation; linearized flow; conical flow. Slender body theory. Methods of characteristics. Shockwave/ boundary layer interactions.

MAE 554 Hypersonic Aerodynamics 3.  
Prerequisite: MAE 553.  
Fundamentals of inviscid and viscous hypersonic flowfields. Classical and modern techniques for calculating shock wave shapes, expansions, surface pressures, heat transfer and skin friction. Applications to high speed aircraft, rockets and spacecraft.

MAE 558 Microfluidics and Nanofluidics 3.  
Prerequisite: MAE 310 and MA 427.  
Macroscale fluid mechanics, heat and mass transfer. Theories of microfluidics and nanofluidics. Applications in mechanical, biomedical, and chemical engineering. Discussions of journal articles and modern fluid dynamics projects. Expert guest lectures on advanced micro/ nanotechnology topics.

MAE 560 Computational Fluid Mechanics and Heat Transfer 3.  
Prerequisite: MA 501 or MA 512, MAE 550 or MAE 557, proficiency in the FORTRAN programming language is required.  
Introduction to integration of the governing partial differential equations of fluid flow and heat transfer by numerical finite difference and finite volume means. Methods for parabolic, hyper-bolic and elliptical equations and application to model equations. Error analysis and physical considerations.

MAE 561 Wing Theory 3.  
Prerequisite: MAE 551.  
Discussion of inviscid flow fields over wings in subsonic flow. Vortex lattice methods, lifting surface theories and panel methods developed for wings with attached flow and leading-edge separation. Calculation of aerodynamic characteristics and determination of effects of planform and airfoil shapes.

MAE 562 Physical Gas Dynamics 3.  
Prerequisite: MAE 550.  

MAE 573 Hydrodynamic Stability and Transition 3.  
Prerequisite: MAE 550.  
Conceptual framework and development of hydrodynamic stability theory. Application of the theory to two-dimensional incompressible and compressible subsonic, transonic, supersonic and hypersonic flows. Results for three-dimensional flows. Introduction of mechanisms of transition and discussion of transition models in numerical methods.

MAE 575 Advanced Propulsion Systems 3.  
Prerequisite: Both MAE 458 and MAE 459 or both MAE 302 and MAE 308.  
The course will focus on non-turbomachinery, air-breathing hypersonic aeropropulsion applications. Specific propulsion systems to be covered include ramjets and scramjets, pulsed detonation engines, and combined cycle engines, with historical perspective.

MAE 577 Multiscale Two-phase Flow Simulations 3.  
Modeling and simulation of two-phase flows using interface tracking approach and ensemble averaging approaches. Model validation and verification based on interface-tracking data, boiling models. Nuclear reactor applications. The course focuses on interface tracking methods understanding as applied to bubbly flow simulations. Students will develop a simplified solver to track 2D bubbles/droplets throughout the course homework assignments and will learn how to apply this approach for better understanding of multi-phase flow as part of the course project.

MAE 586 Project Work In Mechanical Engineering 1-6.  
Individual or small group investigation of a problem stemming from a mutual student-faculty interest. Emphasis on providing a situation for exploiting student curiosity.

MAE 589 Special Topics In Mechanical Engineering 1-3.  
Prerequisite: Advanced Undergraduate standing or Graduate standing.  
Faculty and student discussions of special topics in mechanical engineering.

MAE 665 Master's Supervised Teaching 1-3.  
Prerequisite: Master's student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

MAE 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.  
Prerequisite: Master's student.  
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

MAE 690 Master's Examination 1-9.  
Prerequisite: Master's student.  
For students in non-thesis master's programs who have completed all credit hour requirements for their degree except preparing for and taking the final master's exam.

MAE 693 Master's Supervised Research 1-9.  
Prerequisite: Master's student.  
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.  
Thesis Research.

MAE 696 Summer Thesis Research 1.  
Prerequisite: Master's student.  
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.
Prerequisite: Graduate standing in Mechanical Engineering, Consent of Adviser.
Individual research in the field of mechanical engineering.

MAE 702 Statistical Thermodynamics 3.
Prerequisite: MAE 501.
Analysis and establishment of conclusions of classical thermodynamics from the microscopic viewpoint. Topics include: ensemble methods, partition functions, translational, rotational and vibrational energy modes of an ideal gas, chemical equilibrium, imperfect gases, dense fluids, critical-point theories, mean free path concepts, Boltzmann equation, hydrodynamic equations from kinetic theory and properties of disordered composite media.

MAE 704 Fluid Dynamics of Combustion II 3.
Prerequisite: MAE 504.

MAE 707 Advanced Conductive Heat Transfer 3.
Prerequisite: MAE 505 or MA 501.

MAE 708 Advanced Convective Heat Transfer 3.
Prerequisite: MAE 550.
Advanced topics in steady and transient, natural and forced convective heat transfer for laminar and turbulent flow through conduits and over surfaces. Mass transfer in laminar and turbulent flow. Inclusion of topics on compressible flow with heat and mass transfer.

MAE 709 Advanced Radiative Heat Transfer 3.
Prerequisite: MAE 505.
Comprehensive and unified treatment of basic theories; exact and approximate methods of solution of radiative heat transfer and the interaction of radiation with conductive and convective modes of heat transfer in participating and non-participating media.

MAE 718 Acoustic Radiation II 3.
Prerequisite: MAE 518.
Advanced treatment of the theory of sound generation and transmission. Topics include: techniques for solution of the wave equation, radiation from spheres, cylinders and plates, sound propagation in ducts, scattering.

MAE 721 Robust Control with Convex Methods 3.
Prerequisite: Graduate standing in Engineering and Applied Mathematics, MAE 521 or ECE 716.
This course emphasizes on control design techniques which result in closed-loop systems that are insensitive to modeling errors and which achieve a prespecified level of performance. Robustness margins against model uncertainty. Robust control design techniques based on linear matrix inequalities. Topics include uncertainty modeling, robust stability and performance, $H_{\infty}$ control, convex optimization technique (LMI), multi-analysis and synthesis, computer-aided analysis and control design.

MAE 725 Geophysical Fluid Mechanics 3.
Prerequisite: MAE 501.
The principles of fluid mechanics applied to geophysical systems. Special emphasis placed on those features of these systems, such as almost rigid rotation and stable stratification, which produce unique and important effects. The effects of almost rigid rotations on homogeneous and stratified flows examined in detail.

MAE 726 Advanced Geophysical Fluid Mechanics 3.
Prerequisite: MAE 725 or equivalent.
Principles of fluid mechanics applied to geophysical systems. Special emphasis on role of stable stratification on the flows in these systems. Detailed study of generation, interaction, propagation and dissipation of internal gravity waves. Study of other geophysically important flows.

MAE 730 Modern Plasticity 3.
Prerequisite: Grad. course in elasticity or strength of materials.
Classical theories of plasticity and solutions pertaining to rate-independent and -dependent deformations modes in metals, geomaterials and concrete. Ductile failure modes, i.e., shear-strain localization and other failure modes associated with large deformation modes. Inelastic wave propagation, crystalline constitutive formulations and computational aspects of quasi-static and dynamic plasticity.

MAE 731 Materials Processing by Deformation 3.
Prerequisite: Six hrs. of solid mechanics and/or materials.
Presentation of mechanical and metallurgical fundamentals of materials processing by deformation. Principles of metal working, friction, forging, rolling, extrusion, drawing, high energy rate forming, chipless forming techniques, manufacturing system concept in production.

MAE 734 Finite Element Analysis II 3.
Prerequisite: MAE 533.
Advanced treatment of finite element analysis for non-linear mechanics problems, including most recent developments in efficient solution procedures. Plate bending and shell elements, computational plasticity and viscoplastic materials, large deformation formulations, initial stability and buckling, structural vibrations, incompressible elasticity, contact problems, flow in incompressible media, weighted residuals and field problems. Development of efficient algorithms for practical application.

MAE 742 Mechanical Design for Automated Assembly 3.
Prerequisite: Graduate standing or PBS status in Engineering.
Mechanical design principles important in high volume production using modern automated assembly technology. Production and component design for ease of assembly as dictated by part handling, feeding, orientation, insertion and fastening requirements. Existing product evaluation and redesign for improved assembly.

MAE 766 Computational Fluid Dynamics 3.
Prerequisite: MAE 560; proficiency in the FORTRAN programming language is required.
Advanced computational methods for integrating, by use of finite differences, and finite volume discretizations, non-linear governing equations of fluid flow; the Euler equations and the Navier-Stokes equations. Topics from current literature.

MAE 770 Computation of Reacting Flows 3.
Prerequisite: MAE 560, MAE 766.
MAE 776 Turbulence 3.
**Prerequisite:** MAE 550.
Development of basic concepts and governing equations for turbulence and turbulent field motion. Formulations of various correlation tensors and energy spectra for isotropic and nonisotropic turbulence. Introduction to turbulent transport processes, free turbulence, and wall turbulence.

MAE 787 Structural Health Monitoring 3.
**Prerequisite:** MAE 541 or MAE 513 or equivalent.
The course will provide the students with in-depth knowledge of technologies in structural health monitoring using smart materials as sensing and actuating elements to interrogate the structures. Damage detection techniques such as wave, impedance, and vibration-based damage detection techniques will be discussed and applied to different types of structures. Advanced signal processing techniques such as wavelet, neural network, principal component analysis will be used to make the damage more quantifiable.

MAE 789 Advanced Topics In Mechanical Engineering 1-3.
**Prerequisite:** Graduate standing.
Faculty and graduate student discussions of advanced topics in contemporary mechanical engineering.

MAE 801 Mechanical Engineering Seminar 1.
Faculty and graduate student discussions centered around current research problems and advanced engineering theories.

MAE 830 Doctoral Independent Study 1-3.
Individual investigation of advanced topics under the direction of member(s) of the graduate faculty.

MAE 885 Doctoral Supervised Teaching 1-3.
**Prerequisite:** Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

MAE 890 Doctoral Preliminary Examination 1-9.
**Prerequisite:** Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

**Prerequisite:** Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

**Prerequisite:** Doctoral student.
Dissertation Research.

MAE 896 Summer Dissertation Research 1.
**Prerequisite:** Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

**Mechanical Engineering Systems (MES)**

**MES - Mechanical Engineering Systems Courses**

**MES 300 Systems Engineering 4.**
**Prerequisite:** C- or better in MAE 206.
This course provides an introduction to the theory and practice of formal systems engineering. Students are exposed to systems thinking, systems modeling and performing engineering design within a formal systems engineering framework. They will perform requirements definition and analysis, system architecting, test and integration plan development, economic evaluation of alternatives, and formal technical reviews. Requires Junior standing.

**MES 305 Mechanical Engineering Systems Lab I 1.**
**Prerequisite:** MSE 201 and MAE 206.
Course provides an introduction to the theory and practice of manual and computer assisted laboratory measurement techniques, data analysis, design of experiments and technical report writing. Students learn to successfully conduct and document an engineering experiment. For MES Majors only.

**MES 401 MES Capstone Design I 3.**
**Prerequisite:** MES 300 and MAE 316; Corequisite: MAE 310 and MAE 415.
This course is first in a two-semester engineering design and manufacturing experience which is the culmination of the MES student’s undergraduate education experience. In teams, students design, cost, and build a working prototype to solve a real-world engineering problem supplied by an industry partner. Students follow a systems engineering approach to manage their project through a requirements definition review, a preliminary design review, and the completion of detailed design. Students develop communication skills through reports and presentations and gain insight into engineering design through guest lectures. Students must provide any transportation needed for this class. MES students only.

**MES 402 MES Capstone Design II 4.**
**Prerequisite:** MES 401.
This course is second in a two semester engineering design and manufacturing experience which is the culmination of the MES student’s undergraduate education experience. In teams, students solve a real-world engineering problem supplied by an industry partner. In the two courses, students follow a formal systems engineering approach to manage their project through the following reviews: System Requirements, Conceptual Design, Preliminary Design, and Critical Design. Students develop written and verbal communication skills and gain insight into engineering design practices through guest lectures from local engineers. Students must provide any transportation needed for this class. MES students only.

**MES 405 Mechanical Engineering Systems Lab II 2.**
**Prerequisite:** MES 305 and MAE 314 and MAE 308; Corequisite: MAE 435 and MAE 310.
In this course, students apply the measurement and experimental techniques learned in MES 305 to explore, experience and verify key theoretical concepts from the fields of thermal science, fluid mechanics, solid mechanics, and dynamics and controls. Students learn to successfully design, conduct, analyze, document and present a statistically sound engineering experiment. For MES students only.

**Medical Textiles (MT)**

---

**Medical Textiles (MT)**

---
**MT - Medical Textiles Courses**

**MT 105 Introduction to Medical Textiles 3.**
Introduction to the structures and methods of production of polymers, fibers, yarns and fabrics used in medical applications. Survey of the performance requirements of current medical textiles and healthcare products used in health centers, as surgical implants and as consumer products. Overview of the structure, organization and integration of the medical textile, medical device and pharmaceutical industries within the healthcare sector. Credit not allowed if previous credit for TT 105.

**MT 323 Introduction to Theory and Practice of Medical Fiber and Yarn Formation 3.**
Prerequisite: (PY 211 or PY 205) and (PCC 203 or CH 221 or CH 225 or TE 200).
Introduction to the manufacture of fibers and filament yarns used in medical textiles. It includes the flow behavior of polymeric materials as it relates to fiber formation. It also includes the application of fiber forming theories to synthetic and biopolymeric fibers used in medical textiles. The common methods of yarn manufacture are introduced.

**MT 366 Biotextile Product Development 3.**
Prerequisite: (TT 105 or MT 105 or PCC 105), (TE 200 or CH 223 or 227), and TT 327: Co-requisite: TT 305, TT 341, and TT 351.
Overview of the product development process for medical textiles and implantable biotextile devices. FDA classification system for medical and healthcare products. Review steps in identification of healthcare needs, market size and demand, product specifications and design, prototype fabrication and sterilization, in vitro testing of mechanical, chemical, surface and biological properties, in vivo animal testing, regulatory issues, consumer and clinical trials and explant analysis. Examples of medical textiles for personal hygiene, wound care, external support, orthopedic, general surgery, dental and tissue engineering applications. The student will be introduced to the process of new product development as it applies to medical textiles and biotextiles.

**MT 381 Medical Textile and the Regulatory Environment 3.**
Prerequisite: Junior standing.
The course will focus on the legal and regulatory environment as it impacts the design, manufacture, marketing and distribution of medical textiles and healthcare products. Fundamentals of legal theory, contract law, intellectual property, licensing, product liability and the Food and Drug Administration will be covered, providing the student with the ability to recognize and understand the legal issues involved with the medical textile supply chain.

**MT 432 Biotextiles Evaluation 3.**
Prerequisite: MT 323 and BIO 183; Corequisite: MT 366 or TE 466.
Evaluation of the performance of biotextiles and medical polymers in biological and microbiological environments, with an emphasis on in vitro and in vivo techniques for testing the biocompatibility and biostability of implantable biomedical products. Related issues will deal with quality assurance systems, inspection and sampling plans, ISO certification, good manufacturing practices, reference materials and organisms, and the use of accelerated tests and animal trials so as to meet regulatory requirements.

**MT 471 The Chemistry of Synthetic and Natural Bipolymers 3.**
Prerequisite: CH 220 or 221 or 225.
Introduction to natural and synthetic biopolymers used for biomedical applications. Goals and challenges of biomaterials selection for biomedical engineering. Polymer concepts of polymerization and characterization. Sources/synthesis, chemical and physical properties and degradation mechanisms are described. Polymer classes include: polysaccharides, proteins, polyesters, polyurethanes, polyanhydrides and polyethers.

**Microbiology (MB)**

**MB - Microbiology Courses**

**MB 101 Introduction to Microbiology and Biochemistry Laboratory Practices 3.**
Curricular bridge between high school and college for high school and transitional students. A “hands on” introduction to fundamentals in Microbiology and Biochemistry. Bacterial isolation, identification and growth using aseptic technique, microscopy, and metabolic analysis. Experiments with DNA isolation and analysis, protein isolation, and purification, and enzyme kinetics. Lectures and readings on background, theory and applications of these techniques. Field trips to university and industry research laboratories. This course is part of the Summer College in Biotechnology and Life Sciences (SCIBLS) as well as other pre-college, transitional and early-college programs and is offered as 4 week intensive course. Applicants should have completed high school courses in biology and chemistry. Students must have completed no more than 30 credit hours. Departmental approval is required for current NCSU students.

**MB 103 Introductory Topics in Microbiology 1.**
Introduction to scope and objectives of university education. Emphasis on microbiology. Career opportunities, computers, university resources.

**MB 180 Introduction to Microbial Bioprocessing 3.**
Curricular bridge between high school and college for high school and transitional students. Fundamental cell biology concepts pertaining to biomanufacturing. Students gain an understanding of the basic principles of microbiology, culture preparation, physiology, and genetics of microbial cell cultures. Team-based decisions, collaborations and consideration of multiple perspectives are emphasized. Practical experience in laboratory and culture techniques used in biomanufacturing. Transportation will be provided for field trips. This course is part of the Summer College in Biotechnology and Life Sciences (SCIBLS), as well as other pre-college, transitional and early-college programs. Suitable for students with less than 30 credit hours.

**MB 200 Microbiology and World Affairs 3.**
An integrated and comprehensive study of the microbial world and its influence on global events and human affairs.

**MB 210 Phage Hunters 3.**
This course offers first-year students an opportunity for mentored research. Students will apply the scientific method to make novel discoveries. Students will isolate and characterize naturally-occurring bacteriophage (viruses that infect bacteria, but not humans) from the environment. They will present their data to each other, and the genome of one phage will be sequenced. Students have the option to continue in a second semester to annotate that genome, culminating in a submission to genbank and a poster presentation. Students in the course are part of the National Genome Research Initiative funded by The Howard Hughes Medical Institute. Student should have had a high school biology course before taking this course.
MB 211 Phage Genomics 2.
Prerequisite: BIT(MB) 210.
This course offers first-year students an opportunity for mentored research. Student will apply the scientific method to make novel discoveries. Students will build on the work they began in BIT/MB 210; the novel phage isolated in the previous semester will undergo genome sequencing over winter break, and in this course students will learn to analyze and annotate the genome sequence. This semester will culminate in a submission to genbank and a poster presentation. Students in the course are part of the national genome research initiative funded by the Howard Hughes Medical Institute.

MB 351 General Microbiology 3.
Prerequisite: One Biology course (BIO 181, BIO 183, ZO 150 or ZO 160) and one Organic Chemistry course (CH 221 or CH 220).
Rigorous introduction to basic principles of microbiology for students in biological and agricultural sciences and for all students planning to take further courses in microbiology.

MB 352 General Microbiology Laboratory 1.
Corequisite: MB 351.
Laboratory experience in general microbiology. Aseptic technique, enumeration and isolation of bacteria, staining and microscopy. Enumeration of bacteria and viruses. Students who have completed either MB (BEC) 320 or MB 354 may not take this course for credit.

MB 354 Inquiry-Guided Microbiology Lab 1.
Corequisite: MB 351.
Inquiry-guided laboratory experience in general microbiology, for microbiology majors and honors students, and those desiring a more rigorous exposure to this topic. Aseptic technique, isolation and identification of bacteria, staining and microscopy. Enumeration of bacteria and viruses. Students who have completed either MB (BEC) 320 or MB 354 may not take this course for credit.

MB 360 Scientific Inquiry in Microbiology: At the Bench 3.
Prerequisite: CH 101 and BIO 183.
Scientific questions, controls and variables, designing, preparing for and carrying out experiments, keeping a notebook, interpreting results, and presenting their findings: i.e. the pragmatic things a student must know in order to work efficiently in a research lab regardless of the discipline. The experimental system of choice for this class is the bacterial growth curve. Prior or current enrollment in MB 352 or MB 354 recommended.

MB 405 Food Microbiology 3.
Prerequisite: MB 351.
Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage; foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

MB 406 Food Microbiology Lab 1.
Prerequisite: MB 351 and Corequisite: FS 405 or FS 505.
Laboratory experience to complement FS/MB 405. Skills in detecting and quantitating microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunosassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

MB 411 Medical Microbiology 3.
Prerequisite: MB 351.
Comprehensive study of microbial pathogenesis and mammalian host resistance. Diagnosis, prevention, and therapy of common human diseases of microbial origin.

MB 412 Medical Microbiology Laboratory 1.
Prerequisite: MB 352 or MB 354 and Corequisite: MB 411.
Laboratory experience to complement MB 411. Techniques of detection, growth and identification of bacteria and viruses relevant in clinical microbiology laboratories. Good laboratory practices (GLP) and safety stressed.

MB 414 Microbial Metabolic Regulation 3.
Prerequisite: MB 351 and either BCH 351 or 451.
An integrative perspective on bacterial physiology and metabolism through an analysis of metabolic regulatory functions.

MB 420 Fundamentals of Microbial Cell Biotransformations 2.
Prerequisite: MB 352 OR Corequisite of BEC(MB) 320.
This is a half-semester course. Basic microbial cell culture theory and practice: cell physiology, mass balances, and metabolic control as seen in a dynamic bioreactor process to be scalable, consistent, and robust. The lab portion of the course provides students with hands-on experience in culture techniques using bioreactors. Students who have completed MB(BEC) 520 may not take BEC (MB) 420 for credit.

MB 435 Bacterial Pathogenesis 3.
Prerequisite: MB 411 and Jr, Sr, or Graduate Standing.
Focuses on basic principles of bacterial pathogenesis, including mechanisms utilized by these microbes to attach/adhere, internalize or invade, and disseminate through their animal hosts. Bacterial strategies to subvert host defenses and persist within their animal hosts defense mechanisms, and virulence gene regulation will also be discussed. Students cannot get credit for both MB 435 and MB 535. Graduate status required for MB 535.

MB 441 Immunology 3.
P: C- or better in (MB 351 or BCH 351 or BCH 451 or BIO 414 or PB 414 or BIO 421).
Introduction to principles of molecular immunology. Overview of immune system development and function, and discussions of ongoing scientific research regarding immune regulation.

MB 451 Microbial Diversity 3.
Prerequisite: MB 411 and (GN 311 or BCH 351 or BCH 451).
Molecular, biochemical, and evolutionary diversity of the microbial world, including Bacteria, Archaea, and Eukaryotes. Evolutionary perspective on microbial relationships, molecular methods of study and classical and modern biotechnological methods utilizing this genetic diversity to explore the microbial world and use the resulting insight to meet the needs of our own species.

MB 452 Microbial Diversity Lab 2.
Prerequisite: MB 412; Corequisite: MB 451.
This lab course is project-oriented. Students perform a series of classical enrichments and isolations, starting from environmental samples collected by the students themselves. Some of these isolations serve as the starting materials for a series of modern molecular biology experiments, in which students purify DNA, amplify ribosomal DNA by PCR, and have a portion of this gene sequenced. This sequence information is the starting point for the term project, a detailed molecular phylogenetic analysis of the isolated organisms. Students will be required to provide their own transportation during non-scheduled class time for local field sample collection.
MB 455 Microbial Biotechnology 3.
Prerequisite: MB 351 and GN 311.
Introduction to industrial microbiology with focus on biotechnology including developments employing recombinant nucleic acid and monoclonal antibody techniques. Bioremediation, industrial enzymes, transgenic plants, bioprocesses, medical diagnostics, recombinant vaccines production of important secondary metabolites, and other topics. Field trips to local biotechnology companies.

MB 461 Molecular Virology 3.
Prerequisite: MB 351, MB 411.
Introduction to principles of molecular virology. Overview of classification and nomenclature, virus structure, interaction of viruses with cells, organisms (immunology, pathology), and populations (epidemiology). Detailed case studies from major groups of viruses; picornaviruses, togaviruses, orthomyxoviruses, retroviruses, polyomaviruses, and herpesviruses.

MB 470 Emerging and Re-emerging Infectious Diseases 3.
Prerequisite: MB 351.
Human behavior plays a big part in the emergence and reemergence of infectious diseases. Humanity encroaches consistently into previously uninhabited parts of the planet increasing the risk of exposure to novel pathogens that have the potential to jump into the human host or livestock. In addition to exposure to new diseases the complexities of politics and global relations often create opportunities for the re-emergence of infections that were once thought to be under control. This course aims to provide students interested in the health sciences with a foundation to understand the principles governing emergence of diseases.

MB 480 Current Issues in Microbiology 1.
Prerequisite: SMB majors or minors, Senior standing, and MB 351.
Library research on current topics in all areas of microbiology. Presentation of research results orally and in the form of a major term paper.

MB 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

MB 493 Special Problems in Microbiology 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

MB 495 Special Topics in Microbiology 1-3.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

MB 501 Biology of Plant Pathogens 3.
Prerequisite: PP 315, or PP 318, or an introductory course in microbiology.
Biology of microbes that cause plant diseases. The ecology, genetics, physiology, taxonomy, and mechanisms of parasitism, pathogenicity and virulence of bacteria (and other prokaryotes), fungi (and oomycetes), nematodes, and viruses that cause plant diseases. Prepares graduate students for advanced courses in plant pathology, host-parasite interactions, and provides a knowledge base for students in other disciplines involved with plant pathogens or who seek to broaden their knowledge of microbes.

MB 505 Food Microbiology 3.
Prerequisite: MB 351.
Microorganisms of importance in foods and their metabolic activities. Source of microbial contamination during food production, processing and storage. Microbial spoilage; foods as vectors of human pathogens. Physical and chemical destruction of microorganisms in foods and the kinetics involved. Conversions of raw foods by microorganisms into food products. Microbiological standards for regulatory and trade purposes. Credit will not be given for both FS/MB 405 and FS/MB 505.

MB 506 Food Microbiology Lab 1.
Prerequisite: MB 351 and Corequisite: FS 405 or FS 505.
Laboratory experience to complement FS/MB 405. Skills in detecting and quantitating microorganisms and their toxins in foods. Application of colony and direct microscopic counts, most probable numbers, enzyme immunoassays, nucleic acid probes and computer modeling are used to understand the numbers and types of microorganisms or microbial end products in foods. Laboratory safety and oral and written reports are emphasized.

MB 520 Fundamentals of Microbial Cell Biotransformations 2.
This is a half-semester course. Basic microbial cell culture theory and practice: cell physiology, mass balances, and metabolic control as seen in a dynamic bioreactor process to be scalable, consistent, and robust. The lab portion of the course provides students with hands-on experience in culture techniques using bioreactors. Students who have completed MB(BEC) 520 may not take BEC (MB) 420 for credit.

MB 532 Soil Microbiology 4.
Prerequisite: MB 351, CH 220.
Soil as a medium for microbial growth, the relation of microbes to important mineral transformations in soil, the importance of biological equilibrium and significance of soil microbes to environmental quality.

MB 535 Bacterial Pathogenesis 3.
Prerequisite: MB 411, Graduate standing.
Focuses on basic principles of bacterial pathogenesis, including mechanisms utilized by these microbes to attach/adhere, internalize or invade, and disseminate through their animal hosts. Bacterial strategies to subvert host defenses and persist within their animal host defense mechanisms, and virulence gene regulation will also be discussed. Students cannot get credit for both MB 435 and MB 535. Graduate status required for MB 535.
MB 555 Microbial Biotechnology 3.
Prerequisite: Undergraduate microbiology, genetics, and biochemistry course: MB351, BCH 351, and GN 311.
Overview of industrial microbiology focusing on current biotechnology methods (bacteria, yeast, fungi) employing rDNA, optimization of heterologous gene expression, microbial metabolic pathway engineering, metabolomics, protein engineering and recombinant antibodies. Genetic and pathway engineering strategies for developing new microbes to screen for new therapeutic compounds or overproduce: primary metabolites, antibiotics, biotherapeutic proteins, industrially useful enzymes, medical diagnostics, recombinant vaccines, biopolymers. Utilization of biofilms, methods to immobilize biocatalysts, and microbial kinetics are also covered. Field trip to local biotechnology company. Students cannot receive credit for both 455 and 555.

MB 575 Introduction to Mycology 4.
Prerequisite: BS 125 or BS 181 and 183 or BO 200 or PP 315 or PP 318. A survey of the fungal kingdom in context of phyla and classes. Systematics, ecology, biology and utilization. Illustrative material, cultural techniques in laboratories. Collection and paper required.

MB 585 Industry Case Studies in Microbial Biotechnology 3.
Project-based course directly working with biotechnology and pharmaceutical companies. Students work in teams on a company-specific project. Projects range from developing business or marketing plans for new products; writing Small Business Innovation Research (SBIR) grants or white papers; creating procedures, protocols, and/or process improvements for a company-specific process; and studying intellectual property issues. Written and oral communication skills as well as teamwork, flexibility, and ambiguity management are emphasized. Restricted to MBT students.

MB 590 Topical Problems 1-3.
Prerequisite: Graduate standing.
Informal group discussion of prepared topics assigned by instructor.

MB 601 Seminar 1.

MB 610 Special Topics Microbiology 1-6.

MB 620 Special Problems 1-6.

MB 624 Topical Problems 1-3.
Prerequisite: Graduate standing.

MB 670 Laboratory Research Methods 1-3.
Directed research of microbiology graduate students in departmental laboratories prior to selecting thesis research topic. Selection of a minimum of three laboratories for research experience lasting 3 to 5 weeks. Acquisition of research methods relevant to each laboratory. Microbiology graduate students only.

MB 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

MB 686 Teaching Experience 1.
Prerequisite: Microbiology Graduate student.
Faculty mentoring in didactic and methodological aspects of teaching, including instructional technology as well as design and grading of assessment instruments. Provision of individual performance evaluations to encourage enhancement of teaching skills. Microbiology graduate students only.

MB 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master’s exam, etc.

MB 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master’s exam, etc. Students may register for this course a maximum of one semester.

MB 690 Master’s Examination 1-9.
Prerequisite: Master’s student.
For students in nonthesis master’s programs who have completed all other requirements of the degree except preparing for and taking the final master’s exam.

MB 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master’s student.
Thesis research.

Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their theses.

MB 714 Microbial Metabolic Regulation 3.
Prerequisite: MB 351 and either BCH 351 or 451.
An integrative perspective on bacterial physiology and metabolism through analysis of metabolic regulatory functions.

This course will introduce nonparametric and model-based methods for making inferences on population processes (mutation, migration, drift, recombination, and selection). The goal is to provide a conceptual overview of these methods and hands-on training on how to implement and interpret the results. Sample data sets in computer laboratories will integrate summary statistic, cladistic, coalescent, and bayesian approaches to examine population processes in different pathosystems with specific emphasis on eukaryotic microbes, viruses and bacteria.

MB 718 Introductory Virology 3.
Prerequisite: BCH 451 or GN 411 or MB 351.
Introduction to principles of virology including: classification and nomenclature, epidemiology, structure, genome replication, gene expression strategies and cellular infection cycle. Major groups of viruses including those with DNA genomes and positive-sense or negative-sense RNA genomes.
MB 725 Fermentation Microbiology 3.
Fermentation bioprocessing and characteristics, function and ecology of responsible microorganisms. Fermentative activities, growth responses and culture interactions related to metabolism, physiology and genetics of lactic acid bacteria and selected yeasts and molds. Current developments in starter culture technology and genetics; application to food and industrial fermentations.

MB 730 Fungal Genetics and Physiology 3.
Prerequisite: BCH 451, BO 775, GN 411 or PP 501.
Basic concepts of genetics and physiology of fungi, with emphasis on saprophytic and plant pathogenic mycelial fungi. Current literature on evolution, cell structure, growth and development, gene expression, metabolism, sexual and asexual reproduction and incompatibility systems. Laboratory exercises on mutant isolation, sexual and parasexual analysis, genetic transformation, and RFLP and isozyme analysis.

MB 751 Immunology 3.
Prerequisite: BCH 451, GN 411, MB 351.
Introduction to mechanisms of immunity in man and animals. Emphasis on interactions between cells of the immune system in production of immune responses and the molecules in control of these interactions.

MB 758 Microbial Genetics & Genomics 3.
Prerequisite: BCH 451, GN 411.
Structure and function in microbial genetics, with emphasis on microbial genome organization, stable maintenance and evolution. DNA mutation and repair pathways, transcriptional and translational regulation, DNA replication and recombination and characterization of recombinant DNA molecules. Applications of genetic and genomic analysis methods to microbial processes, including strain construction, genome manipulation, and enhancement of gene expression.

MB 774 Phycology 3.
Introduction to taxonomy, morphology, reproduction and ecological importance of organisms which may be included in the algae. Attention to local freshwater flow and physiology of selected species in relation to algal blooms, water quality and nutrient loading in aquatic habitats.

MB 783 Advanced Immunology 3.
Prerequisite: MB (IMM) 751.
In depth study of the basic cellular and molecular mechanisms of immunity, including antigen processing and presentation, T cell development, initiation of the immune response, effector mechanisms, and immunological memory. The course is designed for advanced graduate students who wish to focus on the current concepts in immunology.

MB 790 Topical Problems 1-3.

MB 801 Seminar 1.

MB 810 Special Topics Microbiology 1-6.

MB 820 Special Problems 1-6.

MB 824 Topical Problems 1-3.
Prerequisite: Graduate standing.

MB 870 Doctoral Lab Rotations 1-3.
Directed research of microbiology graduate students in departmental laboratories prior to selecting thesis research topic. Selection of a minimum of three laboratories for research experience lasting 3 to 5 weeks. Acquisition of research methods relevant to each laboratory. Microbiology graduate students only.

MB 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

MB 886 Teaching Experience 1.
Prerequisite: Microbiology Graduate student.
Faculty mentoring in didactic and methodological aspects of teaching, including instructional technology as well as design and grading of assessment instruments. Provision of individual performance evaluations to encourage enhancement of teaching skills. Microbiology graduate students only.

MB 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

MB 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Military Science (MS)

MS - Military Science Courses

MS 101 Introduction to Leadership and Values I 1.
Prerequisite: Freshman standing or Sophomore standing.
This course introduces students to fundamental components of service as an officer in the United State Army. Initial lessons form building blocks of progressive lessons in values, fitness, leadership and officership. Classroom instruction includes "life skills" including physical and mental fitness, communication theory, and interpersonal relationships. Upon completion, students will be prepared to receive more complex leadership instruction.

MS 102 Basic Military Leadership 1.
Familiarizes students with the fundamentals of map reading, land navigation techniques, small unit tactics and leadership, personal goal setting, Army Leadership and values, ethical decision making as well as Army basics.
MS 201 Intermediate Leadership Theory I.  
Instruction is orientated on communication and leadership theory using practical exercise to apply communications and leadership concepts. Critical “life skills” and their relevance to success in the Army are stressed. Upon completion of this course, students will understand fundamental principles of leadership, and be prepared to intensify practical application in subsequent coursework.

MS 202 Intermediate Leadership Theory II.  
Prerequisite: MS 201.  
This course focuses on the purpose, roles, and obligations of commissioned officers. Coursework will include origins of Army institutional values and practical application in decision making and leadership. Upon completion of this course, students will possess and understanding of leadership and officercraft, demonstrate the ability to apply these skills, and be prepared for the Advanced Military Science Program.

MS 295 Special Topics in Military Leadership.  
Intensive supervised study in applied military leadership and management in an organization or historically applied scenario. Departmental approval required.

MS 301 Military Leadership and Training Management.  
Prerequisite: ROTC advanced course cadet.  
Organizational leadership and processes in the Army; leadership activities and key management functions. Management and conduct of group training activities.

MS 302 Intermediate Small Unit Tactics.  
Prerequisite: ROTC advanced course cadet.  
Planning, organizing and executing military operations at the squad and platoon level. Focus on the leader’s actions, map reading, and navigation.

MS 401 Advanced Military Science - Leadership and Systems Management.  
Prerequisite: MS 301, MS 302.  
A course designed to familiarize the student with the fundamentals of staff operations and procedures, military correspondence, and the U.S. Army training management system. Also included are the Officer Personnel Management and Officer Evaluation Report systems (OPMS/ OER), the Army logistics system, mobilization and deployment, and intelligence/electronic warfare.

MS 402 Advanced Military Science - Military Justice, Ethics and Professionalism.  
Prerequisite: MS 401.  
The role of military justice, the Uniform Code of Military Justice (UCMJ) and the procedures for accomplishing certain legal actions. Ethics and professionalism of the officer corps. Also included are counseling techniques and continued preparation for the transition from cadet to commissioned officer. Emphasis on student interaction and small group exercise practical application.

MS 495 Special Topics in Military Science.  
Individualized readings/research of Company Command level issues and implementation of the Uniform Code of Military Justice, DOD Policies, and additional duties required of company grade officers. Departmental approval required-advanced course students only.

Multidisciplinary Studies (MDS)

MDS - Multidisciplinary Studies Courses

MDS 595 Special Topics in Multidisciplinary Studies.  
Prerequisite: Graduate standing.

Music (MUS)

MUS - Music Courses

MUS 103 Music Theory I.  
Prerequisite: MUS 120 or Rudiments Placement Test. Co-requisite: MUS 104.  
Continuation of the principles taught in MUS 120. Topics include rhythm and meter, modes and non-diatonic scales, harmonic analysis, cadences, non-harmonic tones, phrase structure, musical texture, and basic part-writing principles.

MUS 104 Aural Skills I.  
Prerequisite: MUS 120 or aural skills placement test; Co-requisite: MUS 103.  
The development of aural perception skills in tonal harmony through sight-singing and rhythm reading; scale, interval, and chord identification; melodic, harmonic, and rhythmic dictation; and computer-based music learning.

MUS 107 Class Piano I.  
Introduction to playing the piano by learning the basics of music notation, five-finger scales, and beginner’s repertoire based on hand position.

MUS 112 Men’s Choir.  
Rehearsal and performance of choral repertoire for men’s voices. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue.

MUS 113 Women’s Choir.  
Rehearsal and performance choral repertoire for women’s voices. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue. Audition required. May be repeated up to 10 semesters.

MUS 114 Chamber Singers.  
Rehearsal and performance choral repertoire for small vocal ensemble. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue. Audition required. May be repeated up to 10 semesters.

MUS 115 State Chorale.  
Rehearsal and performance of advanced choral repertoire from all eras. Includes instruction in individual vocal techniques, rehearsal protocols, and discussion of historical and musical significance of repertoire. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide their own transportation to a local performance venue. Audition required. May be repeated up to 10 semesters.

MUS 120 Introduction to Music Theory.  
Introduction to Music Theory is designed for students with minimal or no music theory background and covers the fundamentals of music, including note reading in treble and bass clefs, rhythm, meter, scales, key signatures, intervals, triads, and basic keyboard skills. This course prepares students for entry into Music Theory I (MUS 103) and Aural Skills I (MUS 104), although students may elect to test out by means of a placement test. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event. Auditing is not permitted. Prerequisites: None.
MUS 121 Raleigh Civic Symphony 1.
Rehearsal and performance of significant repertoire for symphony orchestra from the 18th-21st centuries, including individual practice techniques, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated for up to 10 semesters.

MUS 122 Raleigh Civic Chamber Orchestra 1.
Rehearsal and performance of significant repertoire for chamber orchestra from the 17th-21st centuries, including individual practice techniques, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated for up to 10 semesters.

MUS 131 Marching Band 1.
Rehearsal and performance of repertoire for marching band. Study of drill and instrumental techniques, memorization, and repertoire of varying styles for large ensemble. May be repeated for credit. There is a band uniform charge; transportation to performances will be provided. Audition required. May be repeated up to 10 semesters.

MUS 132 Varsity Band 1.
Rehearsal and performance of repertoire for varsity or athletic band. Study of instrumental techniques and repertoire of varying styles for large ensemble. May be repeated for credit. There is a band uniform charge; transportation to performances will be provided. Audition required. May be repeated up to 10 semesters.

MUS 133 British Brass Band 1.
Prerequisite: Audition required.
British Brass Band provides an ensemble performing experience in a wide range of musical styles in the British Brass Band musical medium. Music is selected to provide a challenging opportunity for musical growth. Students must provide their own transportation to off-campus events. There is a charge to the student to check out a department-owned instrument.

MUS 134 Wind Ensemble 1.
Rehearsal and performance of significant repertoire for wind ensemble, including individual practice techniques, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Possible charge for concert dress. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated for up to 10 semesters.

MUS 140 Jazz Improvisation 1.
Study of basic and advanced techniques for jazz improvisation, including in-class performance and study of historical models. May be repeated for credit up to ten semesters. Audition required.

MUS 141 Jazz Combo II 1.
Rehearsal and performance of basic to advanced repertoire for small jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

MUS 142 Jazz Ensemble II 1.
Rehearsal and performance of basic to advanced repertoire for jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

MUS 143 Jazz Combo I 1.
Rehearsal and performance of advanced repertoire for small jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

MUS 144 Jazz Ensemble I 1.
Rehearsal and performance of advanced repertoire for jazz ensemble, including individual practice techniques, improvisation, rehearsal protocols, discussion of historical and musical significance of repertoire, and public performances. May be repeated for credit. Students may be asked to provide individual transportation to an off-campus local performance. Audition required. May be repeated up to 10 semesters.

MUS 150 Vocal Techniques 1.
Development and practice of vocal techniques suitable to solo and ensemble singing in a variety of musical styles, both historical and contemporary.

MUS 152 Beginning Bagpiping 1.
Instruction in bagpiping, including individual practice techniques and traditional performance practices. Prepares students for advancement into the NC State Pipes and Drums Band. Students will be required to purchase a bagpipe chanter and to provide individual transportation to off-campus performances. The ability to read music is not required upon entry. This course may be taken up to 6 semesters for credit.

MUS 180 Introduction to Musical Experiences 3.
Examination of western musical materials, forms, styles and history through the primary musical experiences of composing, performing, and listening. Course designed for students with no formal musical training.

MUS 181 Exploring Music Theory 3.
Prerequisite: Ability to read music.
Exploring music theory provides the student insight into Basic theoretical elements of music from Western civilization, which are fundamental to analysis and creation of musical compositions. The course will cover tonality, rhythm, intervals, triads, composition of melodies, harmonic progressions, and lead sheets. This course will enrich the student who performs, sings, composes, and enjoys listening to music.

MUS 200 Understanding Music: Global Perspectives 3.
Music as universal human phenomenon. Global approach to music's elements and concepts like melody, rhythm, and timbre; and how it functions in relationship to religious belief, observation, and experience; its role in the formation, expression, and contestation of social identity; and its expressive power in the exposition of narrative and drama.

MUS 201 Introduction to Music Literature I 3.
Survey of Western art music from antiquity to the mid-18th century, with an emphasis on the characteristic forms and styles of the Medieval, Renaissance, and Baroque eras. This course examines the major composers and representative works in light of social, political, and cultural influences. The ability to read music is required.
MUS 202 Introduction to Music Literature II 3.
Survey of Western art music from the mid-18th century to the present, with an emphasis on he characteristic forms and styles of the late Baroque, Classical, Romantic, and Contemporary eras. This course examines the major composers and representative works in light of social, political, and cultural influences. The ability to read music is required.

MUS 203 Music Theory II 3.
Prerequisite: MUS 102 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 102. Topics include part-writing in four voices, harmonic progression, harmonic rhythm, seventh chords, secondary functions, modulation, and binary and ternary forms.

MUS 204 Aural Skills II 1.
Prerequisite: MUS 104 or Aural Skills 1 Placement Test.
Continuation of the principles taught in MUS 104. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 205 Introduction to Music in Western Society 3.
Introduction to the art of music in Western society, for the general student. Focuses on the western art music tradition, including stylistic periods from medieval to post-modern. Begins with the study of basic musical elements, formal principles and compositional techniques.

MUS 206 America's Music 3.
Historical survey of music in the United States, including classical and popular, secular and religious, vocal and instrumental music genres and styles from the 18th to 21st centuries, studied in the context of relevant social and cultural issues.

MUS 207 Class Piano II 1.
Prerequisite: MUS 107.
The study and performance of intermediate piano repertoire.

MUS 208 Piano Pedagogy 2.
Prerequisite: MUS 390 or MUS 207; C: MUS 390.
This course is designed to prepare students to teach piano at the elementary level. Topics discussed are the history of piano pedagogy; principles of pedagogy; age- and level-based learning types; technical, artistic and performance problems; music pedagogy as career; reference and teaching materials; and introduction in MIDI technology. Requirement for music minors in the piano performance emphasis. Prerequisite: MUS 390, 207, or instructor's consent.

This course examines the stylistic evolution and cultural impact of rock music from the birth of rock & roll in the 1950s to the mainstream and alternative rock trends of the late 1970s. Emphasis is placed on the contributions of major artists, commercial and critical reception of the music, the role of instrumentation and arrangement, and changes in recording and communication technology. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event.

MUS 211 History of Rock II: 1980s-present 3.
The course examines the stylistic development and cultural impact of popular music from the 1980s to the present. Emphasis is placed on the contributions of major artists, commercial and critical reception of the music, the role of instrumentation and arrangement, and changes in recording and communication technology. Students may be required to provide their own transportation to and cover the cost of an on- or off-campus event.

MUS 230 Introduction to African-American Music 3.
Comprehensive survey of African-American music in the United States from Colonial times to the present, with emphasis on its unique features and contributions to American culture.

MUS 240 Introduction to the Music Industry 3.
This course provides an introduction to the commercial music industry, including its history and development in the context of multiple popular and traditional genres in the United States. Introduction to the Music Industry will increase a student's understanding of common business practices and related knowledge concerning the music industry. It will also assist those students considering further study of the music industry to effectively maintain a professional music career. Students may be required to provide their own transportation to and cover the cost of on- and off-campus events.

MUS 260 History of Jazz 3.
History of jazz and the contributions of major artists. Emphasis of the various styles that have contributed to this American art form. Investigation of structural forms in the jazz idiom.

MUS 295 Special Topics in Music 1-3.
Special Topics in Music.

MUS 296 Piano Pedagogy 3.
Prerequisite: Some knowledge of music or computer science (e.g. CSC 200).
Survey of the theory and history of computer music, compositional algorithms, digital synthesis techniques, composition of at least one computer music work -- a computer-assisted composition for traditional instruments, a piece for computer music on tape, a real-time piece, or a piece that combines tape and instrument(s).

MUS 297 Music Composition 3.
Theory I (MUS 103) or consent of instructor.
Study and creation of musical works. Emphasis on understanding the language of original music and works imitative of conventional and contemporary musical styles.

MUS 298 Aural Skills II 1.
Prerequisite: MUS 104 or Aural Skills 1 Placement Test.
Continuation of the principles taught in MUS 104. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 305 Music Composition 3.
Prerequisite: MUS 390 or MUS 207; C: MUS 390.
This course is designed to prepare students to teach piano at the elementary level. Topics discussed are the history of piano pedagogy; principles of pedagogy; age- and level-based learning types; technical, artistic and performance problems; music pedagogy as career; reference and teaching materials; and introduction in MIDI technology. Requirement for music minors in the piano performance emphasis. Prerequisite: MUS 390, 207, or instructor's consent.

MUS 390 History of Music 3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 391 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 392 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 393 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 394 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 395 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 396 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 397 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 398 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.

MUS 399 History of Music 1-3.
Prerequisite: MUS 390 or Music Theory 1 Placement Test.
Continuation of the principles taught in MUS 390. Emphasis is placed on sight-singing and melodic dictation involving all diatonic intervals, diatonic triads and 7th chords in open positions, harmonic progressions, counterpoint in two voices, and computer-based music learning.
MUS 330 Music Drama 3.
Survey of staged musical works spanning four centuries. Emphasis on large-scale dramatic works in the genres of opera, operetta, and musical theater. Designed for students with musical and/or theatrical experience.

MUS 350 Music of Asia 3.
Examination of music from a variety of Asian traditions including India and Pakistan, Japan and Korea, Thailand and Indonesia. Emphasis place on philosophical, social and religious contexts from which music emerges and in which it is experienced by native performers and listeners. No previous formal training in music is required.

MUS 360 Women In Music 3.
The role of women in music as patrons, teachers, composers, and performers, placing them within the social, economic, and political framework to which they belong. Emphasis on Western Art Music and the role of women in popular music. No previous formal training in music is required.

MUS 390 Applied Music 1.
Prerequisite: Music Minors Only.
Individual instruction in voice or instrumental performance. Includes development of technique basic to voice or instrument, as well as advancement of artistry, musicianship, and repertoire.

MUS 493 Recital 1.
Prerequisite: 4 Semesters of MUS 390 for Performance Concentration.
MUS 493: Recital is the capstone for a student in the Music Minor performance concentration. Students receive weekly 45-minute individual instruction culminating in a public recital. Students also receive instruction in organizing the recital.

MUS 495 Special Topics in Music 3.
Examination of selected topics in music.

MUS 498 Independent Study in Music 1-3.
Directed independent study of selected topics for students with specialized interests in music and/or advanced musical ability. Credit and content determined by faculty member in consultation with Director of Music. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

MUS 499 Independent Study in Music 1-6.
Independent Study for Natural Resources students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

NR - Natural Resources Courses

NR 100 Introduction to Natural Resources 2.
Orientation to natural resources management. Case study of a current natural resources management issue including biophysical, economic, social and political dimensions. Field experience with local natural resources issues. Career orientation and counseling. Open only to first year Department of Forestry and Environmental Resources students or by permission of instructor.

NR 293 Independent Study in Natural Resources 1-6.
Independent Study for Natural Resources students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

NR 294 Independent Study in Natural Resources 1-6.
Independent Study for Natural Resources students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

NR 295 Special Topics in Natural Resources 1-3.
Special Topics in Natural Resources at the 200 level for offering of courses on an experimental basis.

NR 300 Natural Resource Measurements 4.
Prerequisite: (PB 360 or BIO 360) and ST 311.
Theory and practice of measuring, analyzing, and describing the characteristics of natural ecosystems. Surveying and mapping, inventory of vegetation, soils, wildlife habitat, and hydrology. Sampling, data analysis, and presentation of data. Use of geographic information systems to store, analyze, and present environmental data. Intensive instruction and practice in communication of technical information.

NR 301 Practicum for Professional Development I 1.
Prerequisite: Junior standing, NR Majors.
Instruction in professional report writing and presentation, resume preparation and interview skills, professional ethics and practices, job searching skills; review and critique of professional seminars and coduments from NR 501 students; preparation for summer work experience.

NR 303 Humans and the Environment 3.
Interactions among human populations in the biophysical system and the environment. Emphasis on current issues, ecological principles and their relationships to basic biophysical processes; considers food, population dynamics, public land and common resources, renewable natural resources, pollution, water resources, energy and non-renewable resources.

Prerequisite: Sophomore standing.
Study of sustainable use of natural resources in a global economy with consideration of consumption choices, sustainable production issues, conservation of various managed landscapes, and cross cultural perspectives. Specific topics vary somewhat byyear and study location. Travel in North America in even years and to Sweden in odd years. Domestic or international travel overnight. Depending upon travel location, possible additional expense for passport, health certificate, insurance and domestic or international travel.

NC Global Training Initiative (GTI)

GTI - NC Global Training Initiative Courses

GTI 401 US Culture and Education Colloquium 3.
Overview of US Culture, Higher Education in America, and Student Success Skills for degree or non-degree international students. Guest faculty lectures, media presentations, field trips, and required readings form basis for discussion groups, assignments, and capstone paper (reflection on issues discussed in class, personal development, and required community involvement). Includes break-out discussion groups, field trips, personal projects and research. Students may have additional travel cost associated with field trips. Enrollment limited to first year international students, participants in NC Global Training Initiative Certificate Programs, or by permission of the instructor.

Natural Resources (NR)
NR 360 Internship Experience 3.
Prerequisite: NR 301 and Junior standing.
Internship experience with a natural resource agency or company. Most internships require working and living off-campus. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

NR 400 Natural Resource Management 4.
Prerequisite: Senior standing in NR, ETM, FOM, or FW.
Theory and practice of integrated natural resource management. Quantitative optimization, economics of multiple-use, compounding and discounting, optimal rotations, linear programming. Public and private management case studies and team projects.

NR 401 Practicum for Professional Development II 1.
Prerequisite: NR majors, NR 360.
Preparation and presentation of journal on summer work experience, final report and oral presentation of summer work activities; instruction in presentation techniques; review and critique of seminars and documents; mentoring NR 301 students.

NR 406 Conservation of Biological Diversity 3.
Prerequisite: Junior standing.
Population biology concepts fundamental to understanding the properties of the objects of conservation. Genetic diversity in agriculture, forestry, and animal breeding; the ethical and international policy issues in preservation and management.

Prerequisite: SSC 200 and (PB 360 or BIO 360).
Principles of hydrologic science; classification and assessment of watersheds and stream networks; hydrologic, erosion, and water quality processes in natural and managed watersheds; wetlands hydrology; hydrologic measurements and data analysis; applications of hydrology and water quality management for forest agriculture, and urban ecosystems; watershed restoration. Emphasis field study of watersheds and hydrologic measurements. Two weekend field trips are required. Credit will not be given for both FOR(NR)420 and FOR(NR)520.

NR 421 Wetland Assessment, Delineation and Regulation 3.
Prerequisite: SSC 200, (PB 360 or BIO 360), and (FOR 339 or PB 405).
Wetland definitions and systems of classification and functional assessment; methods for assessing ecological functions of wetlands; identification and delineation of jurisdictional wetlands in accordance with US Army Corps of Engineers procedures; application of federal and state regulatory programs. Five Saturday field trips are required. Credit will not be given for both NR 421 and NR 521.

Prerequisite: Junior standing.
The interaction of legal principles and governmental institutions in the development and implementation of natural resource policy and management. Legal principles, constitutional provisions and the location and organization of governmental programs. Examples from both historic and current case studies.

NR 484 Environmental Impact Assessment 4.
Prerequisite: ET 310 or NR 300 or FOR 260 or SSC 442.
Impact assessment principles, practices, and their evolution. Lectures and field practicums concerning problems addressed by environmental assessment practitioners. Practical implications of current regulatory requirements, especially endangered species and wetlands.

NR 491 Special Topics in Forestry and Related Natural Resources 1-4.
Independent (or group) study or research of a forestry or related natural resources topic with a faculty supervisor of the student's choice. Also courses offered on a trial basis.

NR 493 Independent Study in Natural Resources 1-6.
Independent Study for Natural Resources students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

NR 494 Independent Study in Natural Resources 1-6.
Independent Study for Natural Resources students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

NR 500 Natural Resource Management 3.
Prerequisite: ARE 336 and either ST 311 or ST 350; Graduate standing.
Theory and practice of integrated natural resource management. Quantitative optimization, economics of multiple-use, compounding and discounting, optimal rotations, linear programming. Public and private management case studies and team projects. Graduate students expected to provide more in-depth critique of planning process. Credit will not be allowed for both NR 400 and NR 500.

NR 512 Land Use Policy & Management 3.
Restriction: undergraduate degree or instructor approval.
Graduate course reviewing the history, formation and implementation of major natural resource laws and policies that impact land uses. This course will provide an overview of federal laws and policies that affect decision making by land managers. Weekly lectures will be followed by student presentations of a selected case study of their choosing in the final weeks of the course. Current natural resource / land management (including forestry, air, water, wildlife, climate change and energy) programs and institutions are discussed, analyzed and related to current land use and management policy challenges.

NR 521 Wetland Assessment, Delineation, and Regulation 3.
Prerequisite: SSC 200, BO 360, FOR 212 or BO 405, and FOR 420.
Wetland definitions and systems of classification and functional assessment; methods for assessing ecological functions of wetlands; identification and delineation of jurisdictional wetlands in accordance with US Army Corps of Engineers procedures; application of federal and state regulatory programs. Two required weekend field trips.

NR 548 Historical Environments 3.
Course examines how we know and what we know about historical environments. Compares and contrasts contributions by various disciplines and interdisciplinary approaches to historical ecology and environmental history. Readings drawn from science, social science and humanities literature. Individual investigation projects required.

NR 554 Introduction to Data Analysis in Natural Resources 3.
Prerequisite: ST 512.
Data examination for errors, data cleaning, data summary, statistical analyses options using various procedures of the SAS software and R with an emphasis on natural resource applications. Interpretation of SAS program outputs. Discussions of individual data problems. Hands-on use of computers and the SAS and R software.
NR 571 Current Issues in Natural Resource Policy 3.
Seminar providing an overview of current natural resource issues for
the world and the U.S. Population, sustainable development, food
and agriculture, forests, rangelands, biodiversity, energy resources,
water resources, atmosphere and climate, international policies and
instructions.

NR 595 Special Topics in Natural Resources 1-6.
Individual students or groups of students, under direction of a faculty
member, may explore natural resources related topics of special interest
not covered by existing courses. Format may consist of readings and
independent study, problems, or research not related to thesis. Also used
to develop and test new 500-level courses.

NR 601 Graduate Seminar 1.
Weekly seminar in which students registered for course present the
results of research and special projects. Invitation to all graduate students
and faculty in department to attend and join discussion.

NR 610 Special Topics in Natural Resources 1-6.
Individual students or groups of students, under direction of a faculty
member, may explore natural resources related topics of special interest
not covered by existing courses. Format may consist of readings and
independent study, problems, or research not related to thesis. Also used
to develop and test new 600-level courses.

NR 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the
student in planning for the teaching assignment, observe and provide
feedback to the student during the teaching assignment, and evaluate the
student upon completion of the assignment.

NR 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all
other requirements of the degree except preparing for and taking the final
master's exam.

NR 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of
the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

NR 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course
work during a summer session and who will be devoting full time to thesis
research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-
time enrollment for the master's degree and are writing and defending
their thesis.

Natural Sciences (NSGE)

NSGE - NSGE Courses

NSGE 295 Natural Sciences Special Topics 1-4.
Special topics course offering for the general education Natural Sciences
category.

Natural Sciences and Global Knowledge (NSGK)

NSGK - NSGK Courses

NSGK 295 Natural Sciences and Global Knowledge Special Topics 3.
Special topics course offering for the general education Natural Sciences
and Global Knowledge categories. This course may be used for the
Global Knowledge (GK) co-requisite and/or for the Natural Sciences (NS)
requirement.

Naval Science (NS)

NS - Naval Science Courses

NS 100 Naval Science Lab 0.
Military drill, courtesies and honors, elements of unit leadership, physical
fitness and professional development of the prospective Naval/Marine
Corps Officer. Required for all Naval ROTC students.

NS 110 Introduction to Naval Science 2.
Fundamental orientation to the Naval Service emphasizing the mission,
organization, regulations, customs and traditions, broad warfare
components of Navy and the major challenges facing today's Navy and
Marine Officers.

NS 210 Leadership and Management 3.
Assists students in acquiring knowledge and developing the cognitive
processes necessary to make decisions in the practice of management.
The student will learn the traditional foundations of management while
developing decision skills to apply this knowledge in a real-world setting.
The major focus is centered upon global management, ethics and social
responsibility, total quality management, and cultural diversity.

NS 225 Navigation 4.
A broad yet thorough education in basic ship navigation. Course includes
a study of various navigation methods, weather, the laws of the sea,
and navigational rules. Practical work includes chart plotting and
understanding relative motion.

NS 315 Naval Engineering 3.
Introduction to the application of engineering principles in the research,
development, design, construction, and operation of ships, weapons
systems, and ocean structures, with emphasis on thermodynamic
processes and energy conversions.

NS 325 Naval Weapons Systems 3.
An introduction to the concepts and properties of electronic, physical,
electromagnetic and mechanical systems to foster an understanding of
the theory and principles of operation of shipboard weapons systems,
course emphasizes types of weapons and fire control systems,
capabilities and limitations, theory of target acquisition, identification and
tracking, trajectory and ballistics principles, and basic theory of radar and
sonar.

NS 330 Evolution of Warfare 3.
A survey of the evolution of warfare through the study of selected
campaigns and classic battles with special emphasis on the principles of
war, the military impact of leadership, and the evolution of tactics,
weapons, and weaponry.
Nonprofit Studies (NPS)

NPS 498 Capstone Seminar in Nonprofit Studies 3.
Prerequisite: PS 203, COM 466, Corequisite: NPS 490.
This capstone seminar integrates the knowledge, skills, and abilities gained through coursework in the minor in Nonprofit Studies through class discussions and reflective writings where students draw upon previous service-learning experiences to reflect on challenges facing nonprofit leaders. Case studies and articles that focus on the themes of the minor are used to stimulate class discussions. Nonprofit leaders serve as discussants. In addition, students complete and submit a Nonprofit Studies portfolio, which documents successful achievement of program objectives. Departmental approval required.

Nonwovens (NW)

NW - Nonwovens Courses

NW 503 Materials, Polymers, and Fibers used in Nonwovens 3.
Prerequisite: MA 141, PY 205, PCC 203.
Fundamentals of raw material used in nonwoven processes. Raw material production, chemical and physical properties of nonwoven raw materials and assessment of material properties. Introduction of structure/property relationships for these materials and how these relationships influence end use applications.

NW 504 Introduction to Nonwovens Processes and Products 3.
Prerequisite: MA 141; PY 205, Corequisite: TT503.
Fiber web/nonwoven fabrics produced directly from fibers or their precursors. Physical and chemical nature of local bonding and fiber entanglement. Viable process for producing these fabrics. Economic justification for process and production. Product/process interaction. Plant visits whenever possible.

NW 505 Advanced Nonwovens Processing 3.
Prerequisite: TT/NW503, TT/NW504.
An in-depth understanding of the mechanisms and processes used in the production of nonwoven materials. Design and operation of these mechanisms and processes. Process flow, optimization of process parameters, influence of process parameters on product properties.

NW 506 Bonding Principles in Nonwovens 3.
Prerequisite: MAE 308, MAE 310, TT/NW505.
Fundamentals of fluid mechanics and heat transfer mechanisms during the bonding nonwovens. Provide engineering and in-depth description of hydroentangling, thermal bonding and needle punching techniques. Modeling methods and laboratory work are assigned.

NW 507 Nonwoven Characterization Methods 3.
Prerequisite: ST 361, Corequisite: TT/NW 505.

NW 508 Nonwoven Product Development 3.
Prerequisite: TT/NW505, TT/NW507.

Nuclear Engineering (NE)
NE - Nuclear Engineering Courses

NE 201 Introduction to Nuclear Engineering 4.
Prerequisite: Grade of C or better in MA 241, PY 205.
An introduction to the concepts, systems and application of nuclear processes. Topics include radioactivity, fission, fusion, reactor concepts, biological effects of radiation, nuclear propulsion, and radioactive waste disposal. Designed to give students a broad perspective of nuclear engineering and an introduction to fundamentals and applications of nuclear energy.

NE 202 Radiation Sources, Interaction and Detection 4.
Prerequisite: PY 208 and CSC 112.
Introduction to nuclear energy. Topics include radioactivity, radiation detection, interaction of radiation with matter, nuclear reactions, fission, fusion, nuclear reactors, radiation safety and protection, and laboratory measurement of nuclear radiation.

NE 235 Nuclear Reactor Operations Training 2.
Principles of nuclear reactor operations. Lectures to cover basic nuclear engineering theory pertaining to fission reactor operations; laboratory sessions to provide hands on training with the PULSTAR nuclear reactor including facility pre-startup checks, approach to criticality, steady state operations, and measurement of various operating parameters. Qualified students may opt to enter training and study for the U.S. Nuclear Regulatory Commission exam to become federally licensed nuclear Reactor Operators. Does not count towards NE graduation requirements.

NE 301 Fundamentals of Nuclear Engineering 4.
Prerequisite: MA 341, CSC 112, C- or better in NE 202.
Introductory course in nuclear engineering. Neutron physics, reactor operation, and reactor dynamics. Basic principles underlying the design and operation of nuclear systems, facilities and applications. Laboratory sessions include neutron detection and measurement, reactor instrumentation, and reactivity measurements.

NE 400 Nuclear Reactor Energy Conversion 4.
Prerequisite: MAE 301 and a C- or better in NE 301.
Introduction to the concepts and principles of heat generation and removal in reactor systems. Power cycles, reactor heat sources, analytic and numerical solutions to conduction problems in reactor components and fuel elements, heat transfer in reactor fuel bundles and heat exchangers. Problem sets emphasize design principles. Heat transfer lab included. Credit will not be given for both NE 400 and NE 500.

NE 401 Reactor Analysis and Design 4.
Prerequisite: C- or better in NE 301, Corequisite: MA 401.
Elements of nuclear reactor theory for reactor core design and operation. Includes one-group neutron transport and multigroup diffusion models, analytical and numerical criticality search, and flux distribution and calculations for homogeneous and heterogeneous reactors, slowing down and thermalization models and transient isotropics. Laboratory observations and correlation of reactor measurements with theory.

NE 402 Reactor Engineering 4.
Prerequisite: MAE 308 and either NE 400 or MAE 310.
A course in thermal-hydraulic design and analysis of nuclear systems. Single and two-phase flow, boiling heat transfer, modeling of fluid systems. Design constraints imposed by thermal-hydraulic considerations are discussed. A thermal-hydraulics laboratory included. Credit will not be given for both NE 402 and NE 502.

NE 404 Radiation Safety and Shielding 3.
Prerequisite: NE 301 with a grade of C- or better or NE 419.
Radiation safety and environmental aspects of nuclear power generation. Radiation interaction, photon attenuation, shielding theory and design project, external and internal dose evaluation, reactor effluents and release of radioactivity into the environment, transportation and disposal of radioactive waste; and environmental impact of nuclear power plants.

NE 405 Reactor Systems 3.
Prerequisite: NE 401, NE 402.
Nuclear power plant systems: design criteria, design parameters, and economics. Topics covered include: PWR, BWR, core design, primary loops, auxiliary and emergency systems; containment, reactor control and protection systems, accident and transient behaviors.

NE 406 Nuclear Engineering Senior Design Preparation 1.
Prerequisite: NE 401, Corequisite: NE 402.
Preliminary design phase in nuclear engineering systems to prepare for the final phase design. Preliminary designs developed by teams with advice of faculty, with reports presented in oral and written form. Current and future systems emphasized, and use of computers encouraged.

NE 408 Nuclear Engineering Design Project 3.
Prerequisite: NE 406.
Projects in design of practical nuclear engineering systems. Preliminary designs developed by teams with advice by faculty as needed, with reports presented in oral and written form. Current and future systems emphasized, and use of computers encouraged.

NE 409 Nuclear Materials 3.
Prerequisite: MSE 201.
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

NE 412 Nuclear Fuel Cycles 3.
Prerequisite: NE 401.
Processing of nuclear fuel with descriptions of mining, milling, conversion, enrichment, fabrication, irradiation, reprocessing, and waste disposal. In-core and out-of-core nuclear fuel management design, including objectives, constraints, decisions and methodologies. Nuclear power plant and fuel cycle economics.

NE 418 Nuclear Power Plant Instrumentation 3.
Prerequisite: ECE 221 or ECE 331.
Instrumentation and supporting systems required for control and protection of a nuclear power plant. Radiation measurement, process measurement, and reactor operating principles used to develop instrumentation requirements and characteristics. Requirements and implementations of instrumentation, control and protection systems for pressurized and boiling water reactors. Design and implementation issues include power supplies, signal transmission, redundancy and diversity, response time, and reliability.

NE 419 Introduction to Nuclear Energy 3.
Prerequisite: PY 202 or PY 208.
Electrical power generation from nuclear fission, fundamental aspects of fission chain reaction, and reactor design. Reactor types, their static and dynamic characteristics and instrumentation. Reactor operation and safety. Nuclear fusion and fusion reactor development. Not open to majors in Nuclear Engineering.
NE 491 Special Topics in Nuclear Engineering 1-4.
Detailed coverage of special topics.

NE 500 Nuclear Reactor Energy Conversion 3.
Prerequisite: MAE 301.
Introduction to the concepts and principles of heat generation and removal in reactor systems. Power cycles, reactor heat sources, analytic and numerical solutions to conduction problems in reactor components and fuel elements, heat transfer in reactor fuel bundles and heat exchangers. Problem sets emphasize design principles. Credit will not be given for both NE 400 and NE 500.

NE 501 Reactor Analysis and Design 3.
Prerequisites: NE 520, MA 401, and CSC 112.
Elements of nuclear reactor theory for reactor core design and operation. Includes one-group neutron transport and multigroup diffusion models, analytical and numerical criticality search, and flux distribution and calculations for homogeneous and heterogeneous reactors, slowing down models, introduction to perturbation theory. Credit for both NE 401 and NE 501 is not allowed.

NE 502 Reactor Engineering 3.
Prerequisite: MAE 308.
Thermal-hydraulic design and analysis of nuclear systems. Single and two-phase flow, boiling heat transfer, modeling of fluid systems. Design constraints imposed by thermal-hydraulic considerations are discussed. Credit will not be given for both NE 402 and NE 502.

NE 504 Radiation Safety and Shielding 3.
Prerequisite: NE 401 or NE 520.
A basic course in radiation safety and environmental aspects of nuclear power generation. Topics include radiation interaction, photon attenuation, shielding, internal and external dose evaluation, reactor effluents and release of radioactivity into the environment, transportation and disposal of radioactive waste; and environmental impact of nuclear power plants. Term-long project.

NE 505 Reactor Systems 3.
Prerequisite: NE 401, NE 402.
Nuclear power plant systems: PWR, BWR and advanced concepts. Design criteria, design parameters, economics, primary and secondary loops, safety systems, reactor control and protection systems, containment, accident and transient behaviors, core design, and reactivity control mechanisms. Term-long project. Credit for both NE 405 and NE 505 is not allowed.

NE 509 Nuclear Materials 3.
Prerequisite: MSE 201.
Introduces students to properties and selection of materials for nuclear steam supply systems and to radiation effects on materials. Implications of radiation damage to reactor materials and materials problems in nuclear engineering are discussed. Topics include an overview of nuclear steam supply systems, crystal structure and defects, dislocation theory, mechanical properties, radiation damage, hardening and embrittlement due to radiation exposure and problems concerned with fission and fusion materials. Students cannot receive credit for both 409 and 509.

NE 512 Nuclear Fuel Cycles 3.
Prerequisite: NE 401.
Processing of nuclear fuel with description of mining, milling, conversion, enrichment, fabrication, irradiation, shipping, reprocessing and waste disposal. Fuel cycle economics and fuel cost calculation. In-core and out-of-core nuclear fuel management, engineering concepts and methodology. Term-long project. Credit for both NE 412 and NE 512 is not allowed.

NE 520 Radiation and Reactor Fundamentals 3.
Prerequisite: MA 341 and PY 208.
Basics of nuclear physics and reactor physics that are needed for graduate studies in nuclear engineering. Concepts covered include, atomic and nuclear models, nuclear reactions, nuclear fission, radioactive decay, neutron interactions, nuclear reactors, neutron diffusion in non-multiplying and multiplying systems, and basic nuclear reactor kinetics.

NE 521 Principles of Radiation Measurement 3.
Prerequisites: Graduate standing in Nuclear Engineering or instructor permission.
Radiation detection measurement methods employed in nuclear engineering. Topics include: physics of nuclear decay and nuclear reactions, interaction of charged particles, photons, and neutrons with matter, fundamental properties of radiation measurement systems, statistical analysis of radiation measurements, common radiation detectors (gas-filled detectors, scintillators, and semiconductor detectors), data acquisition and processing methods, and radiation measurement applications.

NE 528 Introduction to Plasma Physics and Fusion Energy 3.
Prerequisite: MA 401 and PY 208.
Concepts in plasma physics, basics of thermonuclear reactions; charged particle collisions, single particle motions and drifts, radiation from plasmas and plasma waves, fluid theory of plasmas, formation and heating of plasmas, plasma confinement, fusion devices and other plasma applications.

NE 531 Nuclear Waste Management 3.
Prerequisite: MA 341.

NE 541 Nuclear Nonproliferation Technology and Policy 3.
Technology and policy challenges and solutions to prevent the spread of nuclear weapons. Topics include: issues of nuclear proliferation inherent to civilian nuclear power development; technologies, processes, and policies for safeguarding nuclear materials and technology; integrating the preceding subjects to strengthen the global nuclear nonproliferation regime. Includes a field trip to Oak Ridge National Laboratory during Spring Break to gain hands-on experience with safeguards measurements of nuclear material. The field trip is required; there is no cost to the student.

NE 577 Multiscale Two-phase Flow Simulations 3.
Modeling and simulation of two-phase flows using interface tracking approach and ensemble averaging approaches. Model validation and verification based on interface-tracking data, boiling models. Nuclear reactor applications. The course focuses on interface tracking methods understanding as applied to bubbly flow simulations. Students will develop a simplified solver to track 2D bubbles/droplets throughout the course homework assignments and will learn how to apply this approach for better understanding of multi-phase flow as part of the course project.

NE 591 Special Topics In Nuclear Engineering I 1-6.
Credits Arranged.

NE 592 Special Topics In Nuclear Engineering II 1-6.
Credits Arranged.

NE 601 Seminar 1.
Discussion of selected topics in nuclear engineering.
NE 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

NE 690 Master’s Examination 1-9.
Prerequisite: Master’s student.
For students in non thesis master’s programs who have completed all other requirements of the degree except preparing for and taking the final master’s exam.

NE 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

NE 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

NE 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

NE 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their theses.

NE 721 Nuclear Laboratory Fundamentals 3.
Prerequisite: MA 401 and NE 401.
Laboratory experiments and techniques that are useful and instructive to a Nuclear Engineer. The labs include experiments on radiation detectors and detection techniques, Gamma-and X-ray spectroscopy, and use of the thermal neutron beam of the nuclear reactor for neutron imaging. All state-of-the-art radiation detectors are taught and used. Restricted to Nuclear Engineering Graduate Students.

NE 722 Reactor Dynamics and Control 3.
Prerequisite: NE 401 or NE 520.
Methods of describing and analyzing dynamic behavior of systems. These methods applied to reactor systems and the effects of feedbacks studies. Methods of measuring the behavior of reactor systems and development of logic systems for control and safety.

NE 723 Neutron Transport Theory 3.
P:NE 520 or NE 401/501.
Advanced theory of neutron transport and computational methods of solving particle transport (linear Boltzmann) equation for reactor physics problems. Principle topics: models of neutron transport; analytic methods for solving transport equation; asymptotic diffusion limit; PN and SPN methods, homogenization methodology; numerical methods for multidimensional problems; computational methods for multiphysics problems. Objective is to enable students to read literature and perform relevant analysis of neutron transport and reactor-physics problems.

NE 724 Reactor Heat Transfer 3.
Prerequisite: NE 402 and NE 401 or NE 520.
Consideration of heat generation and transfer in nuclear power reactors. Topics include reactor heat generation, steady-state and transient heat combustion in reactor fuel elements, boiling heat transfer and single and two-phase flow.

NE 726 Radioisotopes Measurement Applications 3.
Prerequisite: NE 401 or NE 520.
Introduction the student to measurement applications using radioisotopes and radiation. Discussion of all major tracing, gauging and analyzer principles and treatment of several specific applications in detail. Objective is to familiarize student with design and analysis of industrial measurement systems using radioisotopes and/or radiation.

NE 727 Nuclear Engineering Analysis 3.
Prerequisite: NE 401 or NE 520.
Fundamental material on: (1) numerical methods for solving the partial differential equations pertinent to nuclear engineering problems, (2) Monte Carlo simulation of radiation transport and (3) data and error analysis techniques including estimation of linear and nonlinear model parameters from experimental data.

NE 729 Reactor Theory and Analysis 3.
Prerequisite: NE 723, NE 727.
Theoretical aspects of neutron diffusion and transport related to the design computation and performance analysis of nuclear reactors. Principal topics: a unified view of the neutron cycle including slowing down, resonance capture and thermalization; reactor dynamics and control; fuel cycle studies; and neutron transport methods. Background provided for research in power and test reactor analysis.

NE 730 Radiological Assessment 3.
Prerequisite: NE 404 or NE 504.
Principles of analyzing environmental radiation transport and resulting human exposure and dose and dose management. Sources term of radiation exposure, the radon problem, transport or radionuclides in the atmosphere, surface water, and groundwater, pathways modeling, radiation dosimetry, probabilistic models for environmental assessment, uncertainty analysis, and radiation risk management. A package of computer codes is developed as a class project.

NE 732 Principles of Industrial Plasmas 3.
Prerequisite: NE/PY 528.
Theory and fundamental physical principles of industrial plasmas. Applications in plasma processing, plasma manufacturing technology, arcs and torches, plasma sprayers, high-voltage high-current switching devices, plasma-driven devices and plasma-aided technology. Emphasis on particle transport and plasma flow.

NE 740 Laboratory Projects In Nuclear Engineering 3.
Prerequisite: NE 721.
Enhancement of laboratory skills pertinent to nuclear engineering research through projects that requiring student to design the experiment, assemble equipment, carry out the measurements and analyze and interpret data. Students work in groups of two and perform to completion two laboratory projects.

NE 745 Plasma Laboratory 3.
Prerequisite: NE 528 or PY 508 or PY 509.
Experimental plasma generation and plasma diagnostic techniques. Lecture topics include high vacuum techniques, perturbing and non-perturbing probe techniques, and laser and emission spectroscopy. Laboratories utilize various methods of measuring plasma parameters discussed in lectures.

NE 746 Fusion Energy Engineering 3.
Prerequisite: NE 528.
Description and analysis of the technologies of devices necessary to produce fusion energy including vacuum technology, plasma heating and fueling, magnetics, special energy conversion, neutronics, materials, environment and safety. Stress upon design integration and ensuing technological constraints.

---

NC State University
NE 751 Nuclear Reactor Design Calculations 3.  
Prerequisite: NE 723.  
Application of digital computer to problems in reactor core nuclear design.  
Study and exercise of available reactor core physics computer modules.  
Description of systems and programs used by industry for power reactor core design and core follow. A review of relevant analytic and numerical methods facilitates computer program development by students.

NE 752 Thermal Hydraulic Design Calculations 3.  
Prerequisite: NE 724.  
Advanced presentation of thermal-hydraulic analysis of nuclear power systems. Topics including development of single phase and two-phase fluid flow equations, subchannel analysis, interphase phenomena and numerical solution methods relevant to design and safety analysis codes.

NE 753 Reactor Kinetics and Control 3.  
Prerequisite: NE 722.  
The control of nuclear reactor systems. Development of basic control theory including the use of Bode, Nyquist and S-plane diagrams and state-variable methods. Analysis of reactor and reactor systems by these methods and development of control methods and optimum-control methods. Discussion of models of reactors and reactor-associated units, such as heat exchangers. Presentation of effects of nonlinearities.

NE 755 Reactor Theory and Analysis 3.  
Prerequisite: NE 723, NE 727.  
Theoretical aspects of neutron diffusion and transport related to the design computation and performance analysis of nuclear reactors.  
Principal topics: a unified view of the neutron cycle including slowing down, resonance capture and thermalization; reactor dynamics and control; fuel cycle studies; and neutron transport methods. Background provided for research in power and test reactor analysis.

NE 757 Radiation Effects On Materials 3.  
Interaction of radiation with matter with emphasis on microstructural modification, physical and mechanical effects. Defects generation and annealing, void swelling, irradiation growth and creep, and irradiation induced effects in reactor materials are discussed. Current theories and experimental techniques are discussed.

NE 761 Radiation Detection 3.  
Prerequisite: NE 726.  
Advanced aspects of radiation detection such as computer methods applied to gamma-ray spectroscopy, absolute detector efficiencies by experimental and Monte Carlo techniques, the use and theory of solid state detectors, time-of-flight detection experiments and M\textsubscript{2}sbauer and other resonance phenomena.

NE 762 Radioisotope Applications 3.  
Prerequisite: NE 726.  
Presentation of advanced principles and techniques of radioisotope applications. Topics include radiotracer principles; radiotracer applications to engineering processes; radioisotope gauging principles; charged particle, gamma ray and neutron radioisotope gauges.

NE 770 Nuclear Radiation Attenuation 3.  
Prerequisite: NE 727.  
Physical theory and mathematical analysis of the penetration of neutrons, gamma-rays and charged particles. Analytical techniques including point kernels, transport theory, Monte Carlo and numerical methods. Digital computers employed in the solution of practical problems.

NE 772 Environmental Exposure and Risk Analysis 3.  
Prerequisite: ST 511 or ST 515.  
Course covers the identification, transport, and fate of hazardous substances in the environment; quantification of human exposures to such substances; dose-response analysis; and uncertainty and variability analysis. The general risk assessment framework, study design aspects for exposure assessment, and quantitative methods for estimating the consequences and probability of adverse health outcomes are emphasized.

NE 780 Magnetohydrodynamics & Transport in Plasmas 3.  
Prerequisite: NE 528, NE/PY 414 and 415.  
Advanced fluid description of plasmas for magnetic fusion, space and industrial plasmas, and other applications. Emphasis on a first principles approach to transport, equilibria, and stability.

Prerequisite: NE 528, NE/PY 414 and 415, Corequisite: MA 775.  
Kinetic theory, waves, and non-linear phenomena in magnetized plasmas. First principles approach to the treatment of instabilities and other collective effects.

NE 795 Advanced Topics In Nuclear Engineering I 1-3.  
A study of recent developments in nuclear engineering theory and practice.

NE 796 Advanced Topics In Nuclear Engineering II 3.  
A study of recent developments in nuclear engineering theory and practice.

NE 801 Seminar 1.  
Discussion of selected topics in nuclear engineering.

NE 885 Doctoral Supervised Teaching 1-3.  
Prerequisite: Doctoral student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

NE 890 Doctoral Preliminary Examination 1-9.  
Prerequisite: Doctoral student.  
For students who are preparing for and taking written and/or oral preliminary exams.

NE 893 Doctoral Supervised Research 1-9.  
Prerequisite: Doctoral student.  
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.  
Dissertation research.

NE 896 Summer Dissertation Research 1.  
Prerequisite: Doctoral student.  
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.  
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.
NTR - Nutrition Courses

NTR 220 Food and Culture 3.
This course explores traditional food cultures around the world; highlighting foodways, flavor profiles, and commonly used ingredients. This course focuses on how and to what extent traditional foodways of US immigrants are impacted by the majority culture and how regional cuisines have been impacted by historical migration patterns. Students will examine their own food culture, biases, and how these impact personal interactions with others through a semester-long project. Food tastings and sensory experiences will expose students to a variety of global and US regional cuisines allowing students to compare and contrast flavor profiles and commonly used ingredients. Course is available to all majors.

NTR 301 Introduction to Human Nutrition 3.
Prerequisite: Sophomore standing.
Functions, dietary sources, digestion and absorption, deficiencies and excesses of essential nutrients in humans; dietary guidelines; food labels; the study of diet-disease relationships; the role of diet in heart disease, diabetes, hypertension, osteoporosis; energy balance and weight control; dietary supplement regulation; diet and athletic performance.

NTR 302 Introduction to Nutrition Research, Communication, and Careers 3.
Prerequisite: NTR 301.
This course exposes students to scientific literature, communication, and careers in the field of nutrition. Students will learn how to critically evaluate scientific literature and communicate that information both orally and in writing. Course topics include: research design, nutritional epidemiology, statistics, scientific writing, professionalism, and current nutrition-related "hot topics." Class time will be a combination of lecture and small or large group discussions and individual or group in-class assignments. Student evaluations include in-class assignments, writing assignments, oral presentations, and exams.

NTR 320 Nutrition Education 3.
Prerequisite: NTR 301.
This course exposes students to the principles behind the development, implementation, and evaluation of nutrition education programs in the United States. Course topics will cover behavior change models, educational pedagogies, nutrition needs assessments, curricular and tool development, social marketing, and social media and technology related to nutrition education. The course is a flipped-course design with course content posted online through pre-recorded lectures and reading assignments. In-class lecture time will be reserved for class discussion and in-class assignments. Student evaluations include exams, in-class assignments, and a term paper.

NTR 330 Public Health Nutrition 3.
Students will explore factors that affect the health and nutrition of the population as well as how those factors are identified, studied, and applied to improve health issues. Students will identify services and programs available to address nutrition and health issues. Students will analyze current events related to public health, evaluate nutrition related policy, and advocate for issues related to nutrition.

NTR 401 Advanced Nutrition and Metabolism 3.
Prerequisite: (NTR 301 or NTR 415) and (CH 221 or CH 220 or CH 225). Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference Intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone muscle, blood, growth and development and communication. Credit will not be awarded for both NTR (FS) 401 and NTR (FS) 501.

NTR 410 Maternal and Infant Nutrition 3.
Prerequisite: NTR 301.
Students will explore the current research, controversies, and biological mechanisms related to nutrition for women before, during, and after pregnancy, as well as for infants in utero and after birth.

NTR 415 Comparative Nutrition 3.
Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227.
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

NTR 419 Human Nutrition and Chronic Disease 3.
Prerequisite: Junior standing, ANS 230, or ANS/FS/NTR 301 or ANS/NTR/PO 415.
Current concepts regarding, and physiological bases of the roles of nutrition in the prevention and treatment of acute and chronic disease states in humans with emphasis on the process of scientific discovery, reading of original research and transformation of research findings to public policy.

NTR 420 Community Nutrition 4.
Prerequisite: NTR 301 and junior standing required.
This course exposes students to nutrition-related community programs, agencies, and activities. Through service-learning experiences, students will apply course material to teach nutrition in the community. Course topics will also cover behavior change models, educational pedagogies, and nutrition among diverse populations. Students are expected to provide their own transportation for the community service in the greater Raleigh area. Instructor consent required; Credit will not be given for both NTR 420 and NTR 520.

NTR 421 Life Cycle Nutrition 3.
Prerequisite: NTR 301 and junior standing required.
This course focuses on the physiologic changes and nutritional needs throughout the life cycle. Additionally, students will explore psychosocial and environmental influencers on food consumption and diet quality at each stage of life. Pregnancy and lactation, fetal development, infancy, early childhood, childhood, adolescence, young and middle adulthood, and geriatrics will be examined. Student will apply course content to real-world settings through individual and/or group service-learning projects. Credit will not be given for both NTR 421 and NTR 521.

NTR 454 Lactation, Milk and Nutrition 3.
Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421.
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 454 and 554.
NTR 490 Senior Capstone Experience in Nutrition 4.
Prerequisite: Nutrition Science majors only; Senior status required.
In this capstone course, students will work in groups to complete research and service projects for community partners while gaining professional experiences in nutrition. Students will be expected to apply their knowledge and skills gained throughout their nutrition coursework to develop solutions to problems in public health and community nutrition. Students will complete comprehensive written and poster presentations about their work as a group, in addition to individual reflection(s) about their learnings. Students must provide their own transportation when visiting their community partner site. Students should complete this course in the last semester (or year) of their degree. NTS and NTA Majors only; Senior status required.

NTR 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

NTR 493 Special Problems in Nutrition 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

NTR 495 Special Topics in Nutrition 1-3.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

NTR 500 Principles of Human Nutrition 3.
Prerequisite: CH 220 and (CH 221 or CH 223) and (ZO 160 or BIO 181/183).
Overview of fields of Nutritional Sciences; functions of nutrients in the human body; sources and properties of nutrients; relationships of food industry practices to nutrition. Credit will not be given for both NTR (FS)400 and NTR 500.

NTR 501 Advanced Nutrition and Metabolism 3.
Nutritional biochemistry and physiology as it relates to establishment of nutrient requirements and Dietary Reference intakes. Digestion, absorption, metabolism, storage, and excretion of nutrients and other markers of nutritional adequacy or excess with emphasis on micronutrients. Functions of nutrients, in bone, muscle, blood, growth and development, and communication. Credit will not be awarded for both NTR(FS) 401 and NTR(FS) 501.

NTR 510 Maternal and Infant Nutrition 3.
P: NTR 301 or NTR 500.
Students will explore the current research, controversies, and biological mechanisms related to nutrition for women before, during, and after pregnancy, as well as for infants in utero and after birth.

NTR 515 Advanced Comparative Nutrition 3.
Prerequisite: PO/ANS/NTR 415 or related feed industry experience.
Feed mill management, equipment, maintenance, operation, safety, and regulations pertaining to feed manufacturing. Feed ingredient purchasing, inventory, storage, quality evaluation, and computerized feed formulation. Advanced NTR515 topics include more detailed aspects of feed science and technology, feed mill design and process flow, operations management, feed quality assurance, regulations, and computer applications. The Distance Education section will have independent study assignments in place of lab experience. Credit will not be given for both PO/ANS 425 and NTR 525.

NTR 520 Community Nutrition 4.
Prerequisite: NTR 301 and junior standing required.
This course exposes students to nutrition-related community programs, agencies, and activities. Through service-learning experiences, students will apply course material to complete a needs assessment for a target audience, design and implement a program, and evaluate the program's effectiveness. Course topics will also cover behavior change models, educational pedagogies, and nutrition among diverse populations. Twenty hours of service is required. Students are expected to provide their own transportation for the community service in the greater Raleigh area. Instructor consent required; Credit will not be awarded for both NTR 420 and NTR 520.

NTR 520 Community Nutrition 4.
Prerequisite: NTR 301 and junior standing required.
This course exposes students to nutrition-related community programs, agencies, and activities. Through service-learning experiences, students will apply course material to complete a needs assessment for a target audience, design and implement a program, and evaluate the program's effectiveness. Course topics will also cover behavior change models, educational pedagogies, and nutrition among diverse populations. Twenty hours of service is required. Students are expected to provide their own transportation for the community service in the greater Raleigh area. Instructor consent required; Credit will not be awarded for both NTR 420 and NTR 520.

NTR 525 Advanced Feed Science and Technology 3.
Prerequisite: PO/ANS/NTR 415 or related feed industry experience.
Feed mill management, equipment, maintenance, operation, safety, and regulations pertaining to feed manufacturing. Feed ingredient purchasing, inventory, storage, quality evaluation, and computerized feed formulation. Advanced NTR525 topics include more detailed aspects of feed science and technology, feed mill design and process flow, operations management, feed quality assurance, regulations, and computer applications. The Distance Education section will have independent study assignments in place of lab experience. Credit will not be given for both PO/ANS 425 and NTR 525.

NTR 550 Applied Ruminant Nutrition 3.
Prerequisite: ANS 230 or ANS/NTR/PO 415.
Applied concepts in ruminant nutrition for the practicing agricultural professional. Protein, energy, vitamin and mineral nutrition in relation to the nutritional needs and practical feeding of beef cattle, dairy cattle, sheep, and goats. New developments in feeding systems, feed additives and the prevention and treatment of metabolic disorders. Emphasis on solving problems in case studies. Permission given to under graduates.
NTR 554 Lactation, Milk, and Nutrition 3.
Prerequisite: ANS 230 or FS/NTR 400; BCH 451 or ZO 421.
Nutritional properties of milk as a high-quality food with nutritional diversity. Principles of physiology, biochemistry and cell biology in the mammary gland. Procedures of milk production and milk collection for milk quality and nutrition. Human lactation vs. that of domestic animals. Impacts of biotechnology and food safety on dairy production. Credit will not be given for both ANS 454 and 554.

NTR 555 Exercise Nutrition 3.
Prerequisite: NTR 400/500.
Metabolism of macro- and micronutrients as affected by exercise and physical activity. Effects of dietary patterns, specific foods, dietary supplements and ergogenic aids on sports performance. Reading and discussion of current literature and individual or group projects.

NTR 557 Nutraceuticals and Functional Foods 3.
This course evaluates the weight of evidence from peer-reviewed scientific literature relating food bioactives, whole foods, and diets to disease prevention, athletic performance, and cognitive development/ enhancement. Data are viewed in the context of processing effects, global food and supplement regulations, as well as commercial marketing claims. Key concepts include dose-response, signal transduction, and the use of advanced technologies such as genomics, proteomics and metabolomics. Students will work in teams to develop and write a critical review manuscript suitable for publication.

NTR 561 Equine Nutrition 3.
Prerequisite: ANS 230 or ANS 225 or ANS (NTR, PO) 415 or PO/ NTR 515.
This course explores concepts in equine nutrition including digestive physiology of horses, nutrient requirements for different classes of horses and feed management. Ration evaluation and balancing, as well as problem solving will be a core component to this course.

NTR 594 Special Topics in Nutrition 1-6.

NTR 601 Master's Seminar 1.

NTR 624 Topical Problems In Nutrition 1-6.
Prerequisite: Graduate standing or Senior standing.
Analysis of current problems in nutrition. Also entails the scientific appraisal and solution of a selected problem designed to provide training and experience in research.

NTR 625 Advanced Special Problems In Nutrition 1-6.
Prerequisite: Graduate standing.
Directed research in a specialized phase of nutrition designed to provide experience in research methodology and philosophy.

NTR 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

NTR 690 Advanced Special Problems In Nutrition 1-6.
Prerequisite: Graduate standing.
Directed research in a specialized phase of nutrition designed to provide experience in research methodology and philosophy.

NTR 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

NTR 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

NTR 699 Research In Nutrition 1-9.
Prerequisite: Graduate standing.
Original research preparatory to the thesis for Master of Science or Doctor of Philosophy degree.

NTR 701 Protein and Amino Acid Metabolism 3.
Prerequisite: BCH 453, ZO 421, a 400-level nutrition course.
Study of protein and amino acid metabolism, regulation, dietary requirements and techniques for their investigation in human and other animals.

NTR 706 Vitamin Metabolism 2.
Prerequisite: ANS(NTR,PO) 415 and BCH 453.
Structures, chemical and physical properties, functions, deficiency symptoms, distribution, absorption, transport, metabolism, storage, excretion and toxicity of vitamins in humans and domestic animals. Nutritional significance of essential fatty acids and metabolism of prostaglandins, prostacyclins and leucotrienes.

NTR 708 Energy Metabolism 3.
Prerequisite: BCH 453 and an introductory NTR course.
Relationship of biochemical and physiological events within the cell, tissue, organ and system with the nutrient needs as sources of energy for productive animal life. Digestion, absorption and metabolism of energy sources. Presentation of processes of energy transformations within living structures in relation to energetics, biological oxidations, coupled reactions, anabolic and catabolic systems, metabolic control, partitioning and efficiency.

NTR 764 Advances in Gastrointestinal Pathophysiology 3.
Prerequisite: PHY 503, PHY 504.
This course will focus on advanced gastrointestinal physiology and the pathophysiology of diseases of relevance to scientists involved in animal-related research. In particular, the course will cover the pathophysiology of ulceration, infectious diarrhea, ischemia, motility disorders, and inflammatory diseases of the gut. An in-depth review paper will be required based on recent literature regarding a specific gastrointestinal disease.

NTR 775 Mineral Metabolism 3.
Prerequisite: ANS(NTR,PO) 415, BCH 451 and ZO 421.
Requirements, function, distribution, absorption, excretion and toxicity of minerals in humans and domestic animals. Interactions between minerals and other factors affecting mineral metabolism or availability. Emphasis on mechanisms associated with mineral functions and the metabolic bases for the development of signs of deficiency.

NTR 785 Digestion and Metabolism in Ruminants 3.
Prerequisite: Graduate standing.
Advanced concepts in ruminant digestion and metabolism, with emphasis on bovine, ovine, and caprine species. Major topics include voluntary intake, ruminal fermentation, mechanisms and rates of digestion, absorption and passage of dietary components, and postabsorptive metabolism of carbohydrates, lipids, and proteins. New developments in feeding systems, feed additives and the prevention and treatment of metabolic disorders.
Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their theses.

EOE 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

EOE 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Operations Research (OR)

OR 501 Introduction to Operations Research 3.
Prerequisite: MA 421 or ST 421 or ST 371 and ST 372.
OR Approach: modeling, constraints, objective and criterion. Problems of multiple criteria, optimization, model validation and systems design. OR Methodology: mathematical programming; optimum seeking; simulation, gaming; heuristic programming. Examples, OR Applications: theory of inventory; economic ordering under deterministic and stochastic demand. Production smoothing problem; linear and quadratic cost functions. Waiting line problems: single and multiple servers with Poisson input and output. Theory of games for two-person competitive situations. Project management through PERT-CPM.

OR 504 Introduction to Mathematical Programming 3.
Prerequisite: MA 424, MA 405.
Basic concepts of linear, nonlinear and dynamic programming theory. Not for majors in OR at Ph.D. level.

OR 505 Linear Programming 3.
Prerequisite: MA 405.
Introduction including; applications to economics and engineering; the simplex and interior-point methods; parametric programming and post-optimality analysis; duality matrix games, linear systems solvability theory and linear systems duality theory; polyhedral sets and cones, including their convexity and separation properties and dual representations; equilibrium prices, Lagrange multipliers, subgradients and sensitivity analysis.

OR 506 Algorithmic Methods in Nonlinear Programming 3.
Prerequisite: MA 301, MA 405, knowledge of computer language, such as FORTRAN or PL1.

Occupational Education (EOE)

EOE - Occupational Education Courses

EOE 298 Special Topics in Occupational Education 1-3.
Individual or group study of particular areas of education at the freshman and sophomore levels.

EOE 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.
OR 531 Dynamic Systems and Multivariable Control I 3.
Prerequisite: MA 341, MA 405.
Introduction to modeling, analysis and control of linear discrete-time and continuous-time dynamical systems. State space representations and transfer methods. Controllability and observability. Realization. Applications to biological, chemical, economic, electrical, mechanical and sociological systems.

OR 537 Computer Methods and Applications 3.
Prerequisite: CSC 112 and (MA 341 or MA 305).
Computational approaches to support civil planning, analysis, evaluation and design. Applications to various areas of civil engineering, including construction, structures, transportation and water resources.

OR 560 Stochastic Models in Industrial Engineering 3.
ISE/OR 560 will introduce mathematical modeling, analysis, and solution procedures applicable to uncertain (stochastic) production and service systems. Methodologies covered include probability theory and stochastic processes including discrete and continuous Markov processes. Applications relate to design and analysis of problems, capacity planning, inventory control, waiting lines, and service systems.

OR 565 Graph Theory 3.
Prerequisite: MA 231 or MA 405.

OR 579 Introduction to Computer Performance Modeling 3.
Prerequisite: CSC 312 and MA 421, Corequisite: CSC 501.
Workload characterization, collection and analysis of performance data, instrumentation, tuning, analytic models including queueing network models and operational analysis, economic considerations.

OR 591 Special Topics in Operations Research 1-6.
Individual or small group studies of special areas of OR which fit into students’ programs of study and which may not be covered by other OR courses. Furthermore, course serves as a vehicle for introducing new or specialized topics at introductory graduate level.

Prerequisite: OR Major or OR Minor.
Seminar discussion of operations research problems. Case analyses and reports. Graduate students with minors or majors in operations research expected to attend throughout period of their residence.

OR 610 Special Topics in Operations Research 1-6.
Individual or small group studies of special areas of OR which fit into students’ programs of study and which may not be covered by other OR courses. Furthermore, course serves as a vehicle for introducing new or specialized topics at introductory graduate level.

OR 652 Practicum in Operations Research 1-3.
Prerequisite: OR 501, OR 505, OR 709 and OR 761.
Practicum in problem solving in industry applying applicable OR methodologies. Practical experience in diagnosing and solving problems in operational systems at either an industrial site or at NC State.

OR 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

OR 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master’s exam, etc.

OR 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master’s exam, etc. Students may register for this course a maximum of one semester.

OR 690 Master’s Examination 1-9.
Prerequisite: Master’s student.
For students who have completed all other requirements of the degree except preparing for and taking the final master’s exam.

OR 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

OR 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

OR 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

OR 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For student who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their theses.

OR 705 Large-Scale Linear Programming Systems 3.
Prerequisite: OR 505 and FORTRAN programming experience.
Specialized algorithms for efficient solution of large-scale LP problems. Parametric programming, bounded variable algorithms, generalized upper bounding, decomposition, matrix factorization and sparse matrix techniques. Emphasis on gaining firsthand practical experience with current computer codes and computational procedures.

OR 706 Nonlinear Programming 3.
Prerequisite: OR(IE,MA) 505 and MA 425.
An advanced mathematical treatment of analytical and algorithmic aspects of finite dimensional nonlinear programming. Including an examination of structure and effectiveness of computational methods for unconstrained and constrained minimization. Special attention directed toward current research and recent developments in the field.
OR 708 Integer Programming 3.
Prerequisite: MA 405, OR (MA,IE) 505, Corequisite: Some familiarity with computers (e.g., CSC 112).
General integer programming problems and principal methods of solving them. Emphasis on intuitive presentation of ideas underlying various algorithms rather than detailed description of computer codes. Students have some “hands on” computing experience that should enable them to adapt ideas presented in course to integer programming problems they may encounter.

OR 709 Dynamic Programming 3.
Prerequisite: MA 405, ST 421.
Introduction to theory and computational aspects of dynamic programming and its application to sequential decision problems.

OR 719 Vector Space Methods in System Optimization 3.
Prerequisite: MA 405, 511.
Introduction to algebraic and function-analytic concepts used in system modeling and optimization: vector space, linear mappings, spectral decomposition, adjoints, orthogonal projection, quality, fixed points and differentials. Emphasis on geometricsight. Topics include least square optimization of linear systems, minimum norm problems in Banach space, linearization in Hilbert space, iterative solution of system equations and optimization problems. Broad range of applications in operations research and system engineering including control theory, mathematical programming, econometrics, statistical estimation, circuit theory and numerical analysis.

OR 731 Dynamic Systems and Multivariable Control II 3.
Prerequisite: OR(E,MA) 531.

OR 747 Reliability Engineering 3.
Prerequisite: ST 511.
Introduction to basic concepts of reliability engineering. Application of probability and statistics to estimate reliability of industrial systems; development of reliability measures; analysis of static and dynamic reliability models; development and analysis of fault trees; analysis of Markovian and non-Markovian models; and optimization of reliability models.

OR 760 Applied Stochastic Models in Industrial Engineering 3.
Prerequisite: MA 303, ST 371.
Formulation and analysis of stochastic models with particular emphasis on applications in industrial engineering; univariate, multivariate and conditional probability distributions; unconditional and conditional expectations; elements of stochastic processes; moment-generating functions; concepts of stochastic convergence; limit theorems; homogeneous, nonhomogeneous and compound Poisson processes; basic renewal theory; transient and steady-state properties of Markov processes in discrete and continuous time.

OR 761 Queues and Stochastic Service Systems 3.
Introduction of general concepts of stochastic processes. Poisson processes, Markov processes and renewal theory. Usage of these in analysis of queues, from with a completely memoryless queue to one with general parameters. Applications to many engineering problems.

OR 762 Computer Simulation Techniques 3.
Basic discrete event simulation methodology: random number generators, simulation designs, validation, analysis of simulation output. Applications to various areas of scientific modeling. Simulation language such as SLAM and GPSS. Computer assignments and projects.

OR 766 Network Flows 3.
Prerequisite: OR(IE,MA) 505.
Study of problems of flows in networks. These problems include the determination of shortest chain, maximal flow and minimal cost flow in networks. Relationship between network flows and linear programming developed as well as problems with nonlinear cost functions, multi-commodity flows and problem of network synthesis.

OR 772 Stochastic Simulation Design and Analysis 3.
Prerequisite: (CSC,ECE,IE,OR) 762 and ST 516.
Advanced topics in stochastic system simulation, including random variate generation, output estimation for stationary and non-stationary models, performance optimization techniques, variance reduction approaches. Student application of these techniques to actual simulations. A current topic research paper required.

OR 773 Stochastic Modeling 3.
Prerequisite: BMA 772 or ST (MA) 746.

OR 774 Partial Differential Equation Modeling in Biology 3.
Prerequisite: BMA 771 or MA/OR 731; BMA 772 or MA 401 or MA 501.

OR 791 Advanced Special Topics 1-6.

OR 801 Seminar in Operations Research 1.
Prerequisite: OR Major or OR Minor.
Seminar discussion of operations research problems. Case analyses and reports. Graduate students with minors or majors in operations research expected to attend throughout period of their residence.

OR 810 Special Topics in Operations Research 1-6.
Individual or small group studies of special areas of OR which fit into students' programs of study and which may not be covered by other OR courses. Furthermore, course serves as a vehicle for introducing new or specialized topics at introductory graduate level.

OR 852 Practicum in Operations Research 1-3.
Prerequisite: OR 501, OR 505, OR 709 and OR 761.
Practicum in problem solving in industry applying applicable OR methodologies. Practical experience in diagnosing and solving problems in operational systems at either an industrial site or at NC State.

OR 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

OR 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.
OR 893 Doctoral Supervised Research 1-9.
Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

OR 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Paper Science Engineering (PSE)

PSE - Paper Science Engineering Courses

PSE 201 Pulping and Papermaking Technology 3.
Survey of the pulping and papermaking processes. Covers characteristics of wood and different types of fiber, key equipment and process variables for pulping, bleaching and chemical recovery processes, with emphasis on the kraft process. Papermaking variables and equipment, particularly on a Fourdrinier machine, secondary fiber processing, and aspects of printing and coating discussed.

PSE 211 Pulp and Paper Internship 1.
Prerequisite: PSE 201.
Experience in the pulp and paper industry. Problem solving in an industrial setting to gain insight of pulp and paper technology. Written report required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: PSE 201.
Measurement and characterization of the structural, mechanical, and optical properties of paper and board. Effect of raw materials and manufacturing processes on structure and properties. Basic concepts of paper physics.

PSE 220 From Papyrus to Plasma Screens: Paper and Society 2.
The impact of paper and paper products on society, examined from the broad interdisciplinary perspectives of technology/engineering and sociology/communication. How the written word and printing affected human development and history. How paper products affect people with regard to communication, education, commerce, and comfort/hygiene. The history and development of paper making and the paper industry. Important properties of paper. Basic types of paper products, how they are manufactured, and their impacts. The environmental impacts of paper and the paper industry. Current issues involving the paper industry.

Independent Study for Sustainable Materials & Technology students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

Independent Study for Sustainable Materials & Technology students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

PSE 295 Special Topics in Paper Science & Engineering 1-3.
Special Topics in Paper Science & Engineering at the 200 level for offering courses on an experimental basis.

PSE 322 Wet End and Polymer Chemistry 4.
Prerequisite: PSE 212 and (CH 221 or CH 225) and (CH 222 or CH 226).
Prepares students to solve problems related to chemical usage on paper machines. Subjects include water chemistry, paper machine operations, fibers, fillers, alum, sizing agents, polyelectrolytes, colloidal interactions, strength agents, dyes, strategies to optimize retention, dewatering strategies, strategies to achieve more uniform paper, strategies to improve production rates, recycling aqueous coatings, and wet-end chemical process control.

PSE 332 Wood and Pulping Chemistry 3.
Prerequisite: CH 221/225 and CH 222/226 and CH 223/227 and CH 224/228.
Introduction to carbohydrate chemistry focusing on the structure and reactivity of wood polysaccharides, hemicelluloses and cellulose and on the chemical structure of lignins and wood extractives. Special emphasis on the chemical reaction of wood components occurring in pulping and bleaching processes.

PSE 335 Principles of Green Chemistry 4.
Prerequisite: Grade of C or better in CH 101/102, CH 201/202 (or equivalent general chemistry series), and CH 221/22 (or equivalent).
Introduction to the topic of green chemistry as an emerging field; identification of hazards and classes; overview of sources; alternative solvents and reagents; sustainability of chemical reactions; alternative chemical reactions and pathways; alternative feedstocks; enzymatic catalysis; ionic liquids; re-engineering of chemical processes; chemical synthesis.

PSE 355 Pulp and Paper Unit Processes I 3.
Prerequisite: CHE 205.
Selected topics in chemical engineering as applied in the pulp and paper industry. Emphasis on computational practice.

PSE 360 Pulp and Paper Unit Processes II 3.
Prerequisite: PSE 201, PSE 355 or CHE 311.
Application of chemical engineering principles to the analysis of pulp and paper unit processes. Emphasis on practical problems in fluid dynamics, heat transfer, mass transfer and thermodynamics. Problem solution techniques include hand calculation and computer simulation tools.

PSE 371 Pulping Process Analysis 3.
Prerequisite: PSE 201.
Preparation and evaluation of different types of wood pulp. A new wood raw material is selected each year with the purpose of studying and critically evaluating the principal pulping and bleaching variables.
PSE 415 Paper Industry Strategic Project Analysis 3.
Design problems in process and project engineering are analyzed from strategic, economic, and business perspectives. Typical pulp and paper processes are computer modeled and analyzed with regard to feasibility and profitability. Specific capital projects are assessed for capital requirements, total installed cost, operating costs, payback, and cash flow. Traditional business concepts are presented, including: financial analysis; capital allocation; marketing and pricing theory; manufacturing work systems; management systems; leadership; what “good” looks like. Senior Standing.

PSE 416 Process Design and Analysis 3.
Prerequisite: PSE 417.
Design, management, and analysis of technical projects. Emphasis on concepts and techniques used in economic analysis of projects. Use of computer simulation for process design and cost analyses. Team projects to analyze cost and operating feasibility of proposed major mill modification. Written and oral presentations required throughout the semester.

Prerequisite: PSE 360.
Application of modeling and simulation techniques for the analysis of pulping and papermaking processes. Model development and computer simulation using existing models will allow analysis of process interactions and operating/economic feasibility of process modifications of complex manufacturing systems.

PSE 425 Bioenergy & Biomaterials Engineering 3.
Prerequisite: For PSE Majors: (MAE 301 or CHE 316) and PSE 360; For CHE Majors: CHE 312 and CHE 316; For BAE Majors: MAE 301 and BAE 402.
This course acquaints students with the basic science, terminology, technology, economic concepts, and engineering concepts associated with the conversion of biomass into energy and materials. Topics include: biomass types and properties; biochemical platforms; thermochemical platforms; unit operations; the biorefinery; biocomposites. Some design content is included. Targeted to engineering students with a suitable background (PSE, CHE, BAE).

Prerequisite: Senior standing in PSE.
Study of fundamental knowledge on the structure and properties of fibers and fibrous products, and the related physical and physiochemical mechanisms. Product design exercises will apply the fundamental understanding to specific end use requirements.

Prerequisite: PSE 212, PSE 322, PSE 371.
Product analysis, materials selection, process planning, manufacture of various types of paper using pilot plant equipment, finished product testing and comparison with standard products. Machine unit operations, materials flow balances, energy balances performed on operations. Team assignments with written and oral presentation of results.

PSE 475 Process Control in Pulp and Paper 3.
Prerequisite: Senior standing in PSE.
Overview of the various aspects of control including process modeling, design of control loops and stability analysis in pulp and paper. Emphasis on distributed digital control (DDC), including hands-on programming and control loop development on aDDC computer.

PSE 476 Environmental Life Cycle Analysis 3.
Overview of the various aspects of conducting and interpreting an environmental life cycle analysis on a product or service. Students will learn how to construct a life cycle analysis goal and scope, inventory, assessment and interpretation. Skills in the critique and communication of a life cycle analysis will be developed. Includes an overview of the following life cycle stages: raw materials, energy, transportation, production, use, and end of life. Emphasis on systems thinking. Targeted for students in any science or engineering program. Credit not allowed for both PSE 476 and WPS 576.

Independent Study for Paper Science & Engineering students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

Independent Study for Paper Science & Engineering students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

Park Scholars (PRK)

PRK - Park Scholars Courses

PRK 102 Topics in Scholarship, Leadership, and Service II 0.
Prerequisite: PRK 101, restricted to Park Scholars.
Interdisciplinary seminar with distinguished speakers and community leaders. A one-two day, off-campus trip will develop student leadership skills through examination of leadership challenges facing North Carolina. Volunteer work with an off-campus service agency will build awareness of community needs and how to address those needs. Students may need to use public transportation, which is free to NC State students with their id, to perform required public service. Restricted to Park Scholars.

PRK 202 Topics in Scholarship, Leadership and Service IV 0.
Prerequisite: PRK 201, restricted to Park Scholars.
Interdisciplinary seminar includes speaker seminars and organizing Service Raleigh, a major spring service project. Planning begins for senior year enrichment activities. Students may need to use public transportation, which is free to NC State Students with their id, to perform required public service. Restricted to Park Scholars.

PRK 302 Topics in Scholarship, Leadership, and Service VI 0.
Prerequisite: PRK 301, restricted to Park Scholars.
Interdisciplinary seminar to develop leadership skills through a Leadership Academy, attendance at various speaker seminars and dinners, and through continued community volunteerism. The Leadership Academy is a half-day workshop in February and builds on the skills from the fall Leadership Academy. Students may need to use public transportation, which is free to NC State Students with their id, to perform required public service. Restricted to Park Scholars.
PRK 402 Topics in Scholarship, Leadership and Service VIII 0.  
Prerequisite: PRK 401, restricted to Park Scholars.  
Interdisciplinary seminar will promote understanding of scholarship,  
leadership, and service. Students hold a dinner with a William Friday  
Award recipient, establish their class legacy for the campus, and work  
with younger students on developing their leadership styles. Students  
continue to volunteer in the community. Students may need to use public  
transportation, which is free to NC State Students with their id, to perform  
required public service. Restricted to Park Scholars.

**Parks, Recreation, and Tourism Management (PRT)**

**PRT - Parks, Recreation, and Tourism Management Courses**

**PRT 150 Parks, Recreation and Tourism Management Orientation 1.**  
Introduction topics related to the department of Parks, Recreation and  
Tourism Management; The recreation, tourism, sport and golf industries;  
all PRTM curricula; advising, academic skills, and team work; and  
research and personnel involved in the department and college. PRT,  
SMT and PGM Majors Only.

**PRT 152 Introduction to Parks, Recreation and Tourism 3.**  
Introduction to the professional field of recreation by presenting the basic  
principles, fundamentals and concepts of recreation as related to such  
factors as recreation history and objectives, sociological and economic  
aspects of recreation, leadership qualities and facility provision; and  
settings for organized recreation in modern society.

**PRT 156 Professional Golf Management Orientation 3.**  
Prerequisite: PGM Majors.  
Overview of the golf industry and introduction to the concepts and  
practices of effective golf management including turfgrass management,  
golf shop operations, food & beverage control, customer services,  
personnel management, and tournament operations. Theoretical  
foundations for understanding leisure behavior and the parks, recreation  
and tourism management profession.

**PRT 200 Leisure Behavior, Health and Wellness 3.**  
Leisure as a lifelong resource for human satisfaction and fulfillment; its  
potential for physical, mental, social and emotional growth and emotional  
growth and development of the individual. Leisure opportunity areas  
presented and evaluated.

**PRT 210 Golf Management I 1.**  
Prerequisite: PRT 156.  
Emphasis on concepts, techniques, and practices of teaching golf skills;  
understanding the Professional Golfers’ Association Constitution; rules of  
golf, golf tournament operations; and golf car fleet management.

**PRT 211 Golf Management II 1.**  
Prerequisite: PGM Majors, PRT/PEG 210.  
Advanced concepts, techniques, and practices of teaching golf; golfer  
development programs, golf club design and repair.

**PRT 212 Golf Instructor Development 2.**  
Prerequisite: PRT 156 and PRT 210.  
Students will learn to teach using a variety of instructional methods  
including various technological methods. Students will also learn to teach  
students with a variety of learning styles including visual, auditory  
and kinesthetic. The students will learn the fundamental theories and  
concepts of the golf swing as well as basic ball flight laws.

**PRT 214 Introduction to Adventure Education 3.**  
History and philosophy, social psychology of adventure, theories of  
adventure, benefits, risk-taking behavior, current trends and issues,  
research and evaluation, and model programs. Field trip required.  
Students are responsible for their own transportation for field trip.

**PRT 215 Principles and Practices of Outdoor Leadership 2.**  
Principles and practices of leadership in adventure education and  
recreation programs: group management, trip planning, staffing, group  
dynamics, health and safety issues, risk management and other relevant  
topics.

**PRT 220 Commercial Recreation and Tourism Management 3.**  
Prerequisite: PRT 152.  
Commercial recreation and the tourism industry, including its origin,  
present characteristics, behavioral foundations and societal impacts.  
Emphasis on recreation administration in the commercial sector.

**PRT 238 Diversity and Inclusion in Recreation and Sport 3.**  
Prerequisite: PRT 152.  
Provides knowledge, attitude awareness and resources needed to  
provide programs, services and facilities for all people. Students  
gain an understanding of people’s differences and potential barriers  
to participation. 10 hours of volunteer work with people who have  
disabilities is required. Students are responsible for providing their own  
transportation to and from volunteer work. PRT, SMT and PGM Majors  
Only; PRT minors.

**PRT 250 Management of Park and Recreation Facilities 3.**  
Prerequisite: PRT 152.  
Management principles applied to park, recreation, sport areas and  
facilities. Emphasis on operational efficiency, quality service, fiscal  
responsibility and maintenance management. Laboratory provides for  
application of management and maintenance principles.

**PRT 266 Introduction to Sport Management 3.**  
Introduction to concepts and practices of effective sport programming  
and management at the professional, collegiate and community  
levels. Overview of various program delivery systems such as fitness,  
instructional sport, informal sport, and intramural sport. Examination  
of management elements of sport programming, including planning,  
personnel, finance, facilities, risk and liability and marketing.

**PRT 277 Psychological & Cultural Dimensions of Sport 3.**  
Prerequisite: Sport Management or PRT Majors, PRT 266.  
The psychological behavior of the individual in physical activity and  
sport. The development of sport and the sports industry, political and  
cultural significance of sport, and sport in international relationships.  
The relationship between sport, gender, class, ethnicity, health, drugs,  
violence, education, and life long physical activity.

**PRT 286 Writing and Speaking in Sports Organizations 3.**  
Prerequisite: Sport Management or PRT Majors, PRT 266.  
Concepts related to effective communication within sport organizations.  
Including interpersonal communication, group communication,  
public speaking, use of electronic media, and basic knowledge and  
understanding of media in sport and sport enterprises.
PRT 292 External Learning Experience 1-3.
Prerequisite: PRT 152 and Sophomore Standing.
Learning experience in parks, recreation, tourism, and sports within an academic framework with agencies external to the department. Contact and arrangements with prospective supervisors initiated by the student. Approval by prospective supervisor and departmental undergraduate coordinator necessary. Students can receive between 1 and 3 hours credit for the the learning experience (1 credit = 45 hours) PRT and SMT majors only.

PRT 293 Independent Study in Parks, Recreation, & Tourism Management 1-6.
Independent Study for Parks, Recreation, & Tourism Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

PRT 294 Independent Study in Parks, Recreation, & Tourism Management 1-6.
Independent Study for Parks, Recreation, & Tourism Management students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

PRT 295 Special Topics in Parks, Recreation, and Tourism Management 1-3.
Special topics in the Department of Parks, Recreation, and Tourism Management at the 200 level for offering of courses on an experimental basis.

PRT 311 Golf Course Turf Grass Management 3.
Prerequisite: PGM Majors, Sophomore standing, PRT 211.
Introduction to the roles and responsibilities of the golf course superintendent as well as the practices and procedures associated with golf course turfgrass management. Preparation for completion of Level II Turfgrass Management, elements of the Professional Golfers’ Association of America’s Professional Golf Management apprentice program. Periodically class/lab meetings require transportation to area golf facilities. Students are expected to provide their own transportation accommodations.

PRT 312 Golf Management III 1.
Prerequisite: PGM Majors, PRT 311.
Advanced concepts, techniques, and practices of golf management: business analysis, planning and operations, and analysis of the golf swing. Preparation for completion of PGA of America’s Professional golf Management Level II knowledge tests and skills simulations.

PRT 315 Organization and Administration of Adventure Programs 3.
Prerequisite: PRT 152.
Overview of the organizational and administration of adventure programs and services, professional standards, programming, management, staffing, budgeting, public relations, liability and risk management.

PRT 350 Outdoor Recreation Management 3.
Prerequisite: PRT 152.
Concepts and methods of outdoor recreation planning and management explored with emphasis on the public sector. Current issues relative to recreation provision identified and debated.

PRT 351 Outdoor Consortium 3.
Examines outdoor recreation and resource management approaches and research results from an applied perspective. Students will practice problem-solving techniques and interact with a wide variety of park managers and planners. This course culminates in a week-long field experience that may conflict with other scheduled courses. Field experience held in conjunction with four other universities in the Great Smoky Mountains National Park. A fee will be assessed for the trip.

PRT 358 The Recreation Program 3.
Prerequisite: PRT 152.
Theoretical and applied approaches to the recreation program planning process. Basic elements of programming using a variety of recreational settings and diversity of practical experience.

PRT 359 Leadership and Supervision in Recreation 3.
Prerequisite: PRT 250.
Systematic principles for managing human resource component of parks, recreation and tourism organizations. Leadership, group dynamics, human resources planning and organizing, employee recruitment, selection and supervision.

PRT 366 Sport Programming 3.
Prerequisite: Sport Management and PRT Majors, PRT 266.
Foundations, administrative support systems, delivery systems and desirable practices of sport programming. Program delivery systems overview with emphasis on problems and solutions associated with sport programs. Topics include sport league administration, youth sport delivery issues, sport tournament operations, community based sport delivery issues, college/university recreation sport delivery.

PRT 375 Internship Orientation 1.
Prerequisite: PRT 152.
Preparation for recreation and park internship. Resume writing, interviewing skills, cover letters and internship search techniques and resources.

PRT 376 Sport Administration 3.
P: PRT 266 and Sports Management students only.. Concepts related to policy development, organization and management specific to sport organizations. Including theories and practices of policy development and implementation, management theories, organizational behavior, the strategic management process, organizational design, managing change, and operational planning.

PRT 380 Analysis and Evaluation in Parks, Recreation 3.
Prerequisite: 300-level Statistics course, PRT 359.
Examination of the steps involved in analyzing and estimating the impact of recreation and parks services. Includes relevant issues and useful approaches for systematic analysis. Emphasis is placed on an understanding and development of various types of systematic evaluation designs. Activities leading to the analysis and development of performance reports to assess and improve managerial operational efficiency are covered.

PRT 406 Sports Law 3.
Prerequisite: Junior standing.. Fundamental principles of law, especially tort and contract law, applied to sports situations. Analysis of liability of sports personnel in various roles including participant, coach, promoter, trainer and official. Analysis of common law court decisions in sports contexts well as key state and federal statutory legislation such as civil rights and antitrust.
PRT 407 Services, Facilities and Event Marketing 3.
Prerequisite: PRT 358.
Examination of marketing methods as applied to Parks, Recreation, Tourism and Sport Management facilities and programs. Aspects of advanced marketing: market research, marketing strategy and revenue-generation in both public and private settings. Credit will not be given for both PRT 407 and PRT 507.

PRT 410 Food and Beverage Management 3.
Prerequisite: PGM Majors, Junior standing, PRT 312.
Introduction to practices and procedures in food and beverage service. Basics of food service needs, cost controls, legal issues affecting food and beverage service, staffing, and customer satisfaction. Critical elements of food costing, purchasing, inventory control, menu planning, and security. Preparation for completion of Level III Food and Beverage control elements of the Professional Golfers’ Association of America’s Professional Golf Management apprentice Program.

PRT 411 Club Management 3.
Prerequisite: Junior standing, PRT 152.
Introduction to practices and procedures in contemporary club management. Application of general management functions to club environments including human resources, training, financial management marketing; leadership food and beverage service operations facilities and risk management; legal issues; and career planning. Preparation for completion of Club Management elements of the Professional Golfers’ Association of America’s Professional Golf Management apprentice Program.

PRT 412 Golf Course Architecture 3.
Prerequisite: PRT 211.
Basic principles of golf course design. Historical architectural influences on current golf course design trends. Strategic golf course design principles, shot values, construction practices, environmental issues, and maintenance issues. Golf course design and management implications. Restricted to PGM and Landscape Arch. Majors. Junior Standing.

PRT 413 Golf Management IV 1.
Prerequisite: PGM Majors, PRT 312, Senior standing.
Advanced concepts, techniques, and practices of golf management: swing concepts of teaching, supervising and delegating, merchandising and inventory control. Preparation for completion of PGA of America’s Professional Golf Management Level III knowledge tests and skill simulations.

PRT 414 PGA Apprentice Program Completion 0.
Prerequisite: PGM Majors.
Checkpoint mechanism to register the successful completion of the Professional Golfers’ Association Apprentice requirement.

PRT 419 Sustainable Tourism 3.
This course introduces the concepts and principles associated with sustainable tourism development, emphasizing on their implications for management and planning purposes. Topics to be addressed include: concept, justification and evolution of sustainable development; socio-cultural, economic, and environmental dimensions of sustainable tourism; positive and negative impacts of tourism development; and principles conducive to sustainable tourism planning and community development. Given that each case of tourism development is unique, examples from the U.S. and around the world will be used to examine and discuss issues and practices of sustainable tourism development within different geo-cultural contexts. This course adopts the Problem-Based Learning Format, which promotes and enhances students’ analytical skills, problem solving skill and team working skills. Junior or senior standing.

PRT 420 Resort Planning and Management 3.
Prerequisite: PRT 152.
Theory and practical applications of planning, accommodations management, food and beverage operations, recreation programs and management in the resort industry.

PRT 430 Tourism, Poverty, and Health 3.
Students will learn about the potential role of tourism in fueling equitable development and human health in destination communities, and about the factors that lead to negative social and economic tourism impacts. Students will learn about equitable community development, human health and well-being principles; and about how micro-entrepreneurs and host communities react to the challenges and opportunities posted by tourism development. The course is grounded in scholarly knowledge and is also unreservedly engaged in real life; accordingly, students will work on new ways to help under-resourced individuals pursue dignified livelihoods through tourism. Fieldwork outside of class is required, with a fee of $50.00. PRT majors and PRT minors only.

PRT 442 Recreation and Park Interpretive Services 3.
Prerequisite: Junior standing.
The principles and practices of environmental and historical interpretation. Personal (attended) and non-personal (unattended) interpretive communication techniques. Comprehensive planning and implementation of interpretive programs, and equipment and facilities used in environmental and historical interpretation. One overnight field trip required.

PRT 449 Human Dimensions of Natural Resources in Australia/New Zealand 3.
Corequisite: PRT 450.
This 3.5 week study abroad program examines human dimensions of natural and environmental conservation in Australia. The course will involve an orientation and lectures from faculty at James Cook University. Students will explore the natural environments in Australia including Great Barrier Reef, Tropical Rainforest and Outback and be introduced to Australian culture and history through interactions with communities. Educational travel, active participation, lectures, seminars, and reflective exercises facilitate learning to improve understanding of relationships between human societies and the natural environment. Students must pay program fees, airfare, some meals, and incidentals.

PRT 450 Sustaining Natural Resources in Australia/New Zealand 3.
Corequisite: PRT 449.
This 3.5 week study abroad program will examine issues related to natural history and environmental conservation in Australia. This course will involve an orientation and lectures from Australian university faculty. Students will explore natural environments in Australia including the Great Barrier Reef, Tropical Rainforest and Outback; learn about sustainable development and protection of the natural environment through educational travel, field trips, active participation, lecture presentations and seminars, written assignments, research projects and reflective exercises. Students must apply through NCSU Study Abroad Office. Students must pay program fees, airfare, some meals and incidentals.

PRT 451 Principles of Recreation Planning and Facility Development 3.
Prerequisite: PRT 358.
Planning activities analyzed as decision-making processes. Identification, interpretation, evaluation and utilization of data and resources necessary for recreation planning. Planning principles applied in the analysis of proposed and existing recreation sites.
PRT 454 Parks and Recreation Finance and Administration 3.
Prerequisite: PRT 359.
Recreation and park fiscal administration, sources of finance for operating and capital expenditures, revenue activities, financial planning, budgeting, expenditure policies, auditing and planning for recreation and park services, decision-making tools, legal aspects of administration.

PRT 458 Special Events Planning 3.
Prerequisite: PRT 358.
Theoretical and applied approaches to the planning of special events. Components and considerations of event planning, applied to various recreational settings. Participation in a community special event is required. Attendance at professional conference also required.

PRT 468 Sport Finance and Economics 3.
Prerequisite: Sport Management and PRT Majors, PRT 266, ACC 210, and (ARE 201 or EC 201 or EC 205).
Concepts include sources of revenue for financing, principles of budgeting, spreadsheet utilization, and financial management of sport facilities and enterprises. Additional topics include fundraising principles and methods, economic impact principles and their application to sport venues and events, economic theory applied to sport manufacturing, service industries, professional sports, stadiums and arenas, intercollegiate sports, and the sport club industry.

PRT 475 Recreation and Park Internship 8.
Prerequisite: PRT 350, PRT 358, PRT 359, PRT 375, PRT 380, 100 hours of approved work experience.
Provides prospective park, recreation and leisure service professionals a 400-hour (ten week) learning experience in a selected agency or organization, under the joint supervision of a qualified manager and a university intern supervisor. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PRT 476 Sport Marketing 3.
Prerequisite: PRT 486, Sport Management or PRT Majors, PRT 266.
Fundamental marketing principles and concepts related to the sport industry. Overview of marketing mix, marketing strategies and the bases of segmentation, sponsorship, licensing, fundraising and merchandising. Special emphasis on the marketing of sport and its strong relationship to research. Credit will not be given for both PRT 476 and PRT 407.

PRT 477 Park, Recreation and Tourism Management 3.
Prerequisite: Senior standing.
Integration of knowledge, theory and methods from coursework and experience; development and presentation of comprehensive operational and management problems and plans. Designed to encourage students to function as professionals and to relate areas of specialty to the broader Parks, Recreation and Tourism Management profession. Must be taken during student's last semester of coursework.

PRT 486 Senior Seminar in Sports Management 3.
Prerequisite: Sport Management Majors, Senior standing, PRT 476.
Issues affecting sport management at a national and global level. Interactive effect of strategies and decisions in each cognate area in sport management. Professional ethics and the notion of rights and responsibilities will be examined in the context of sport marketing, finance, communications, risk management and other management functions inherent in the sport enterprise. Students will also examine various theories of ethics and concepts of morality and develop a personal philosophy for social responsibility and management values.

PRT 491 Special Topics in Recreation 1-3.
Investigation and analysis of a problem associated with recreation resources.

PRT 493 Independent Study in Parks, Recreation, and Tourism Management 1-6.
Independent Study for Parks, Recreation, and Tourism Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

PRT 494 Independent Study in Parks, Recreation, and Tourism Management 1-6.
Independent Study for Parks, Recreation, and Tourism Management students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

PRT 500 Conceptual Foundations of Recreation 3.
Exploration of the conceptual foundations of leisure, recreations, sport, play, and work, the history of ideas in the field and the relationships of these ideas to contemporary professional and social problems. Restricted to PRTM masters students and others by consent of the instructor. This course will be offered in an accelerated seven-week format.

PRT 501 Research Methods in Recreation 3.
Restricted to: Graduate-level Statistics.
Examination and understanding of advanced scientific investigative methods in their application toward explaining recreation and leisure behavioral phenomena and for resolution of recreation management problems.

PRT 503 Advanced Fiscal Management for Parks, Recreation, Tourism and Sport Organizations 3.
This course is intended to provide students with advanced concepts of fiscal management as applied to the unique industries of parks, recreation, tourism and sport management. Emphasis will be placed on understanding how the receipt, disbursement, and utilization of funds can foster sustainability within these types of organizations. Additionally, this course will focus on developing the skills necessary to apply ethical financial analysis principles through financial risk management. This course is restricted to PRTM masters students and others by consent of the instructor. This course will be offered online in an accelerated seven-week format.

PRT 504 Data Management and Applications in Parks, Recreation, Tourism and Sport Management 3.
Introduction to procedures and techniques used in research and evaluation in parks, recreation, sport, and tourism settings to solve management problems. The course emphasizes techniques for data collection, management, analysis, and communication of research findings. This course is restricted to PRTM masters students and others by consent of the instructor. This course will be offered online in an accelerated seven-week format.

PRT 505 GIS and Spatial Analysis in PRTS 3.
Prerequisite: ST 311.
Introduction to spatial reasoning and spatial analysis as implemented in geographic information systems (GIS) to perform evaluation and research in parks, recreation, tourism, and sport settings. This course is restricted to PRTM master's degree students or others with consent of the instructor.
PRT 506 Organizational Behavior and Leadership in Parks, Recreation, Tourism and Sport 3.
This course will focus on the organization and administration of public, private and not-for-profit park, recreation, tourism and sports (PRTS) agencies. Emphasis will be placed on understanding the structural, human, political, and cultural factors that impact organizational efficiency and effectiveness - specifically focusing on these environments. The course will primarily address issues related to organization, management, ethical leadership, human personnel supervision, theory, and research. This course is restricted to PRTM master's degree students or by permission of instructor. This course will be offered online in an accelerated seven-week format.

PRT 507 Strategic Marketing Management in Parks, Recreation, Tourism and Sport Organizations 3.
This course examines the theoretical principles and applications of marketing and promotion strategies for recreational sport and key marketing concepts and strategies using case studies. There is significant discussion on marketing activation, leveraging strategies of sport/event sponsor brands/companies, and developing a marketing plan. This course is restricted to PRTM master's degree students and others with the content of the instructor. This course will be offered online in an accelerated seven-week format.

PRT 508 Risk Management for Parks, Recreation, Tourism and Sport Organizations 3.
This course explores risk management in PRTs organizations with an emphasis on ethical managerial strategies. The topics include legal concepts related to specific managerial functions, impacts on functions in recreation environments that result in more efficient and successful operation and protection for the organization. In addition, effective strategies for risk management related to facilitating active-healthy lifestyles and sustainable communities will be explored. This course is restricted to PRT master's degree students and others by consent of the instructor. This course will be offered online in an accelerated seven-week format.

PRT 509 Program Evaluation for Parks, Recreation, Tourism and Sport Organizations 3.
This course focuses on the development of a working knowledge of the rationale, procedures and tools for conducting sound program evaluation assessments in parks, recreation, tourism, and sport organizations. Effective skills for mastering comprehensive program evaluation strategies including formative, summative, and knowledge building strategies are taught. Students explore social science methods specifically appropriate for evaluation of youth programs.

PRT 510 Active Recreation and Community Health 3.
This course focuses on the association of active recreation in communities and community health. Students explore individual, social, community, environmental, and policy factors that affect community health and the contribution of recreation and park programs and facilities. This is a seven week course.

PRT 550 Outdoor Recreation Behavior 3.
Prerequisite: PRT 501.
An understanding of outdoor recreation behavior in natural resource-oriented areas such as state and national parks and national forests. Nature of resource-based recreation experience, influencing factors and implications of this behavior for park management.

PRT 555 Environmental Impacts of Recreation and Tourism 3.
Understanding of environmental impacts of recreation and tourism, and different methods for assessing and managing such impacts. Examination of the scientific and management literature and application of impact assessment techniques.

PRT 595 Special Topics In Recreation Resources 1-6.
Prerequisite: Graduate standing.
Special topics in various aspects of recreation resources developed under direction of a graduate faculty member on a tutorial basis. Subjects offered under this course listing also used to test and develop new courses.

PRT 601 Seminar In Recreation Research 1.
Prerequisite: PRT 501.
Research studies, scientific articles and progress reports on research effects presented and critically evaluated. Each student pursuing a graduate degree expected to take this offering twice for one hour of credit each time.

PRT 610 Special Topics In Recreation Resources 1-6.
Prerequisite: Graduate standing.
Special topics in various aspects of recreation resources developed under direction of a graduate faculty member on a tutorial basis. Subjects offered under this course listing also used to test and develop new courses.

PRT 620 Recreation Resources Problems 1-4.
Prerequisite: Advanced Undergraduate standing or Graduate standing.
Assigned or selected problems in field of recreation administration, planning, supervision, maintenance, operations, financing or program. Special research problems selected on basis of interest of students and supervised by members of graduate faculty.

PRT 650 Professional Electronic Portfolio for Parks, Recreation and Tourism Management 1.
Prerequisite: Graduate Standing and PRT 500 and PRT 504 and PRT 505 and PRT 506 and PRT 508 and PRT 503 and PRT 507.
Students will develop a personalized digital portfolio of the work completed in all required courses in the Masters of Parks, Recreation & Tourism Management program. The portfolio should include evidence, reflection, and critical analysis of core competencies achieved throughout their academic course of study. This course must be taken during a student's last semester after he or she has completed all the required courses.

PRT 660 Professional Practicum 3.
Provides prospective park, recreation, sport or tourism professionals with a 200-hour learning experience in a selected agency or organization, under the joint guidance of a qualified manager and a university supervisor. Requires completion of a project or analytical report for the agency.

PRT 665 Professional Project 3.
Prerequisite: 12 credits of PRT graduate courses.
Directed study in a specialized phase of parks, recreation, sport or tourism management such as supervision, evaluation or administration.

PRT 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.
PRT 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

PRT 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

PRT 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

PRT 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

PRT 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged.

PRT 700 Advanced Theories of Leisure 3.
This course is designed to examine theory as it can be applied to understanding of leisure behavior and parks, recreation, and tourism management research. The goal is to provide a foundation for identifying, evaluating, and applying theoretical perspectives to PRTM research. Students are expected to engage in a critical analysis of theory in PRTM. Ph.D. student.

PRT 705 Qualitative Approaches to Recreation Research 3.
Prerequisite: Doctoral student.
This course provides an introduction to post-positivist and interpretive paradigms as well as the management of qualitative data used in recreation-related research. The interpretive approach and the relationship between methods and research questions are examined along with an assessment of qualitative approaches and applied techniques for data management. Procedures for data analysis and interpretation, the role of the "self" in conducting research, and the issues and ethics that arise in using qualitative approaches are discussed.

PRT 730 Tourism, Community Health, and Sustainability 3.
In this course students will examine the potential role of tourism in mitigating or exacerbating health disparities and environmental degradation in rural poor areas. The course endorses an academic ethic of engaged scholarship. Students will be asked to make original contributions to participatory development scholarship, and they will be asked to collaborate with community partners on an applied project addressing tourism, health disparities and environmental degradation in an economically depressed rural community. Consistent with the engaged nature of this course, we will travel to rural communities to meet stakeholders, collect data, and provide coaching/training to tourism micro-entrepreneurs.

PRT 795 Special Topics in Recreation Resources 1-6.

PRT 801 Seminar In Recreation Research 1.
Research studies, scientific articles and progress reports on research effects presented and critically evaluated. Each student pursuing a doctoral degree is expected to take this offering four times for one hour of credit each time.

PRT 810 Special Topics In Recreation Resources 1-6.
Prerequisite: Graduate standing.
Special topics in various aspects of recreation resources developed under direction of a graduate faculty member on a tutorial basis. Subjects offered under this course listing also used to test and develop new courses.

PRT 820 Recreation Resources Problems 1-4.
Prerequisite: Advanced Undergraduate standing or Graduate standing.
Assigned or selected problems in field of recreation administration, planning, supervision, maintenance, operations, financing or program. Special research problems selected on basis of interest of students and supervised by members of graduate faculty.

PRT 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PRT 890 Doctoral Preliminary Exam 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

PRT 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.
Philosophy (PHI)

PHI - Philosophy Courses

PHI 205 Introduction to Philosophy 3.
Credit is not allowed for both PHI 205 and PHI 210.
Introduction to selected problems of enduring philosophical importance, including such topics as the nature of morality, knowledge, human freedom, and the existence of God. Content varies with different sections.

PHI 210 Representation, Reason and Reality 3.
Credit is not allowed for both PHI 210 and PHI 205.
This course is an introduction to philosophical issues concerning topics such as language, thought, knowledge, reason, truth, and reality through the study of problems, puzzles, and paradoxes. Not both PHI 205 and PHI 210 may be used towards satisfaction on PHI major or PHI minor requirements.

PHI 214 Issues in Business Ethics 3.
An analysis and evaluation of major issues in business ethics. Topics include the social responsibility of business; social justice and free enterprise; the rights and duties of employers, employees, manufacturers, and consumers; duties to the environment, the world's poor, future generations, and the victims of past injustices; the moral status of the corporation; and the ethics of advertising.

PHI 221 Contemporary Moral Issues 3.
Philosophical analysis and theory applied to a broad range of contemporary moral issues, including euthanasia, suicide, capital punishment, abortion, war, famine relief, and environmental concerns.

PHI 250 Thinking Logically 3.
Deductive arguments attempt to guarantee their conclusions. Inductive arguments attempt to make their conclusions more probable. Using a small number of simple, powerful logical techniques, this course teaches you how to find, analyze and evaluate deductive and inductive arguments, and thus how to avoid the most common errors in reasoning.

PHI 298 Special Topics in Philosophy 3.
Selected studies in philosophy that do not appear regularly in the curriculum. Topics will be announced for each semester in which the course is offered.

PHI 300 Ancient Philosophy 3.
Western philosophy of the ancient world, with special emphasis on Plato and Aristotle.

PHI 301 Early Modern Philosophy 3.
Western philosophy of the 17th and 18th centuries, including such philosophers as Descartes, Hobbes, Leibniz, Locke, Berkeley, Hume, and Kant.

PHI 302 19th Century Philosophy 3.
Western philosophy of the 19th century, including such philosophers as Kant, Hegel, Schopenhauer, Kierkegaard, Marx, and Nietzsche.

PHI 305 Philosophy of Religion 3.
The existence and nature of God, including such topics as traditional proofs of God, skeptical challenges to religious belief, miracles, the problem of evil, faith and reason, and religious experience.

PHI 309 Political Philosophy 3.
Prerequisite: One PHI course.
Philosophical study of important political ideas and values such as liberty, equality, justice, rights, and democracy. May include readings from classical and contemporary sources.

PHI 310 Existentialism 3.
Philosophy of Existentialism, including such thinkers as Kierkegaard, Nietzsche, Doestoevsky, Sartre, Heidegger, and Camus.

PHI 312 Philosophy of Law 3.
Fundamental legal issues such as what constitutes a law or legal system. Justifications of legal interference with individual liberty. Philosophical legal issues illustrated by specific legal cases.

PHI 313 Ethical Problems in the Law 3.
Prerequisite: PHI 221, or 375.
Explores uses of the legal system, including such topics as the death penalty, plea bargaining, legalizing euthanasia, censorship, Good Samaritan laws, the insanity defense, civil disobedience, preferential treatment.

PHI 325 Bio-Medical Ethics 3.
Interdisciplinary examination and appraisal of emerging ethical and social issues resulting from recent advances in the biological and medical sciences. Abortion, euthanasia, physician-assisted suicide, compromised infants, aids, reproductive technologies, and health care. Focus on factual details and value questions, fact-value questions, fact-value interplay, and questions of impact assessment and policy formulation.

PHI 330 Metaphysics 3.
Prerequisite: One PHI course.
Problems of metaphysics, including such topics as: possibility and necessity, paradoxes of time travel, nature of space and time, free will and determinism, causation, mind-body problem and identity-over-time.

PHI 331 Philosophy of Language 3.
Prerequisite: One PHI course.
Introduction to traditional and modern accounts of the relations between language and reality, the nature of truth, problems of intentionality and propositional attitudes.

PHI 332 Philosophy of Psychology 3.
Prerequisite: One PHI course or one PSY course.
Problems and controversies that overlap the boundary between philosophy and psychology: the mind/body problem, behaviorism vs. cognitivism, the prospects for artificial intelligence, and language and the questions of innate knowledge.

PHI 333 Knowledge and Skepticism 3.
Prerequisite: One PHI course.
Analysis of such central concepts as knowledge, belief, and truth, and the investigation of the principles by which claims to knowledge may be justified.

PHI 340 Philosophy of Science 3.
Nature of science highlighted by differences between science and pseudoscience, relationships between science and religion, and roles of purpose-directed (teleological) and causal explanation in physical, life and social sciences.

PHI 375 Ethics 3.
Examination of traditional questions of philosophical ethics: What are the principles of moral conduct? What sort of life is worthy of a human being? Includes both classic and contemporary literature.

PHI 376 History of Ethics 3.
Prerequisite: One PHI course.
Topics in the history of ethics. Philosophers to be studied may include Plato, Aristotle, Aquinas, Butler, Hume, Kant, Sidgwick and Nietzsche.
PHI 401 Kant's Critique of Pure Reason 3.
Prerequisite: 8 credits in PHI. Credit is not allowed for both PHI 401 and PHI 501.
A text-based critical study of Kant's Critique of Pure Reason focusing on such topics as perception, judgment, knowledge, space, time, substance, causation and reality. Students cannot receive credit for both PHI 401 and PHI 501.

PHI 420 Global Justice 3.
Prerequisite: One PHI course. Credit is not allowed for both PHI 420 and PHI 520.
The applications of the ideas of justice and right beyond and across the borders of individual nation states, attending to the facts of globalization and their consequences for political and economic justice and human rights. Topics: skepticism about global justice; transnational distributive justice, pollution, and poverty; national sovereignty, self-determination, and intervention; the ethics of war; international human rights; and global democracy. No one can receive credit for both PHI 420 and PHI 520.

PHI 425 Introduction to Cognitive Science 3.
Prerequisite: One upper-level PHI, PSY, CSC or Linguistics course. Credit is not allowed for PHI 425 and PHI/PSY 525.
Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. Topics include: the computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI 425 and PHI/PSY 525.

PHI 440 The Scientific Method 3.
Prerequisite: One PHI course. Credit is not allowed for both PHI 440 and PHI 540.
Detailed examination of core issues in the philosophy of science: the confirmation of scientific theories, falsification, projectibility, the nature of scientific explanation, laws of nature, and causation. Students cannot receive credit for both PHI 440 and PHI 540.

PHI 447 Philosophy, Evolution and Human Nature 3.
Prerequisite: One 300 level or higher course in Philosophy, Biology, Psychology or Anthropology. Credit is not allowed for PHI 447 and PHI 547.
This course covers philosophical issues in the evolutionary study of human cognition; the role of adaptationism; the values of psychological vs. behavioral approaches; the phenotypic gambit; the evolution of morality and altruism; the nature of culture and the possibility of cultural evolution; innateness, genetic determinism and development; and case studies of evolutionary explanation of human behavior or psychology. Students cannot receive credit for both PHI 447 and PHI 547.

PHI 475 Ethical Theory 3.
Prerequisite: PHI 375 or PHI 376. Credit is not allowed for both PHI 475 and PHI 575.
An introduction to some central themes and issues in ethical theory. Topics in normative and meta-ethics such as consequentialism, deontology, virtue ethics, constructivism, realism, relativism, subjectivism, and expressivism. Readings primarily from contemporary literature.

PHI 494 Research and Writing in Ethics 1.
Prerequisite: PHI 250 or LOG/MA 201 or LOG/MA 335 and one other (non PHI 250) PHI course. Corequisite: One of (PHI 298, 309, 310, 313, 325, 375, 376, 420, 475, or 498).
A substantial paper in ethics, assigned by the instructor of the corequisite; enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PHI 495 Research and Writing in History of Philosophy 1.
Prerequisite: PHI 250, LOG 201 or 335 and one other (non PHI 250) PHI course. Corequisite: One of PHI 298, 300, 301, 302, 310, 401 or 498.
A substantial paper in history of philosophy, assigned by the instructor of the corequisite; enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PHI 496 Research and Writing in Contemporary Philosophy 1.
Prerequisite: PHI 250, LOG 201 or 335 and one other PHI course. Corequisite: One of PHI 298, 305, 330, 331, 332, 333, 340, 425, 440, 447 or 498.
A substantial paper in contemporary philosophy, assigned by the instructor of the corequisite; enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PHI 497 Research and Writing in Logic, Representation and Reasoning 1.
Prerequisite: LOG 201 or 335, and one other PHI course, not PHI 250. Corequisite: One of LOG 335, 435/535, 437, PHI 298, 330, 331, 332, 333, 340, 425/525, 440/540 or 447/547.
A substantial paper in logic, representation and reasoning, assigned by the instructor of the corequisite. enrollment subject to departmental approval; may be repeated for credit. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PHI 498 Special Topics in Philosophy 1-6.
Prerequisite: Six credits in PHI courses.
Detailed investigation of selected topics in philosophy. Topics determined by faculty members in consultation with head of the department. Course may be used for individualized study.

PHI 501 Kant's Critique of Pure Reason 3.
Prerequisite: Graduate Standing. Credit is not allowed for both PHI 501 and PHI 401.
A text-based critical study of Kant's Critique of Pure Reason focusing on topics such as perception, judgment, knowledge, space, time, substance, causation, and reality. Students cannot receive credit for both PHI 401 and PHI 501.
PHI 520 Global Justice 3.
Prerequisite: Graduate standing. Credit is not allowed for both PHI 520 and PHI 420.

The applications of the ideas of justice and right beyond and across the borders of individual nation states, attending to the facts of globalization and their consequences for political and economic justice and human rights. Topics: skepticism about global justice; transnational distributive justice, pollution, and poverty; national sovereignty, self-determination, and intervention; the ethics of war; international human rights; and global democracy. Students cannot receive credit for both PHI 420 and PHI 520.

PHI 525 Introduction To Cognitive Science 3.
Prerequisite: Graduate standing. Credit is not allowed for PHI 525 and PHI/PSY 425.

Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. The computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI/PSY 425 and PHI/PSY 525.

PHI 540 The Scientific Method 3.
Prerequisite: Graduate standing. Credit is not allowed for both PHI 540 and PHI 440.

Detailed examination of core issues in philosophy of science: confirmation of scientific theories, falsification, predictability, nature of scientific explanation, laws of nature, and causation. Students cannot receive credit for both PHI 440 and PHI 540.

PHI 547 Philosophy, Evolution and Human Nature 3.
Credit is not allowed for both PHI 547 and PHI 447. Graduate Standing Required.

Core philosophical issues in the evolutionary study of human cognition: the role of adaptationism; the value of psychological vs. behavioral approaches; the phenotypic gambit; the evolution of mortality and altruism; the nature of cultural evolution; innateness, genetic determinism and development; and case studies of evolutionary explanation of human behavior and psychology. Students cannot receive credit for both PHI 447 and PHI 547. Graduate standing required.

PHI 575 Ethical Theory 3.
Prerequisite: Graduate Standing. Credit is not allowed for both PHI 575 and PHI 475.

An introduction to some central themes and issues in ethical theory. Topics in normative and meta-ethics such as consequentialism, deontology, virtue ethics, constructivism, realism, relativism, subjectivism, and expressivism. Readings primarily from contemporary literature. Students cannot receive credit for both PHI 475 and PHI 575.

PHI 598 Special Topics in Philosophy 3-6.

PHI 816 Introduction to Research Ethics 1.
Prerequisite: Graduate standing.

Institutional rules guiding the responsible conduct of research (RCR) and their philosophical justification. Rudiments of moral reasoning and their application to RCR. Topics: plagiarism, falsification and fabrication of data, and ethics versus custom, law, science, and religion.

PHI 896 Summer Dissertation Res 1.

Physical Education/Healthy Living (PEHL)

PEHL - PEHL Courses

Physics (PY)

PY - Physics Courses

PY 123 Stellar and Galactic Astronomy 3.
Introductory, descriptive survey of stars, galaxies and cosmology, designed primarily for non-science majors. Exotic recent discoveries such as quasars, pulsars, and black holes will be included. Complements PY 124, Solar System Astronomy. Companion laboratory course PY 125.

PY 124 Solar System Astronomy 3.
Introductory, descriptive survey of the solar system designed primarily for non-science majors, including current results from space probes, history of astronomy, and the motions of the moon, stars, and planets in the night sky. Complementary course covering stars, galaxies and cosmology (PY 123). Companion laboratory course (PY 125).

PY 125 Astronomy Laboratory 1.
Corequisite: PY 123 or 124.

Introduction to astronomical observing. Twelve exercises include astronomical instruments; the nature of light; Kepler's and Newton's laws of motion; the constellations, planets, binary stars, stellar clusters, and galaxies. Use of small telescopes to observe celestial objects.

PY 131 Conceptual Physics 4.

PY 201 University Physics I 4.
Corequisite: MA 141. Credit is not allowed for both PY 201 and PY 205 or PY 211.

First course of three semester sequence for students majoring in physical and mathematical sciences. Calculus used throughout. Principles of classical Newtonian mechanics covered in detail.

PY 202 University Physics II 4.
Prerequisite: PY 201, MA 141, Corequisite: MA 241. Credit is not allowed for both PY 202 and PY 208 or PY 211.

Second course of three semester sequence designed primarily for students majoring in physical and mathematical sciences. Calculus used throughout. Principles of electricity and magnetism covered in detail.

PY 203 University Physics III 4.
Prerequisite: PY 202, MA 241, Corequisite: MA 242.

Third course of three semester sequence designed primarily for students majoring in physical and mathematical sciences. Calculus is used throughout. Principles of wave optics and modern physics are covered in detail.

PY 205 Physics for Engineers and Scientists I 3.
Prerequisite: MA 141 with a grade of C- or better or MA 241 PL. Credit is not allowed for both PY 205 and PY 201 or PY 211. Co-requisite: PY 206. ADD BOTH PY 205 AND PY 206 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY.

First semester of a two-semester sequence in introductory physics, with coordinated problem-solving experiences. A calculus-based study of mechanics, sound and heat. Credit not allowed for more than one of PY 205, PY 201, and PY 211.
PY 206 Physics for Engineers and Scientists I Laboratory 1.
Prerequisite: MA 141 with a grade of C- or better or MA 241 Placement.
Co-requisite: PY 205. ADD BOTH PY 205 and PY 206 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY.
Laboratory course to accompany the PY 205 lecture course. A calculus-based study of mechanics, sound and heat.

PY 208 Physics for Engineers and Scientists II 3.
Prerequisite: C- or better in PY 205 and C- or better in MA 241. Credit is not allowed for both PY 208 and PY 202 or PY 212. Co-requisite: PY 209. ADD BOTH PY 208 and PY 209 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY.
Second semester of a two-semester sequence in introductory physics. A calculus-based study of electricity, magnetism, optics and modern physics. Credit not allowed for more than one of PY 208, PY 202, and PY 212.

PY 209 Physics for Engineers and Scientists II Laboratory 1.
Prerequisite: PY 205 with grade of C- or better, MA 241 with grade of C- or better, PY 206 with grade of C- or better. Co-requisite: PY 208. ADD BOTH PY 208 and PY 209 TO YOUR SHOPPING CART AND THEN ENROLL SIMULTANEOUSLY.
First semester of a two-semester introductory sequence in non-calculus physics, with laboratory. Mechanics, heat, wave motion and sound. Credit not allowed for more than one of PY 211, PY 201 or PY 205.

PY 211 College Physics I 4.
Prerequisite: MA 107 or 111 or 121 or 131 or 108 or 141 with a C- or better, or 480 on the SAT Subject Test in Mathematics Level 2 or the NCSU Math Skills Test, or 2 or better on an AP Calculus exam. Credit is not allowed for both PY 211 and PY 201 or PY 1.

PY 212 College Physics II 4.
Prerequisite: PY 211 or PY 205. Credit is not allowed for both PY 212 and PY 202 or PY 208.
Second semester of a two-semester introductory sequence in non-calculus physics, with laboratory. Electricity, and magnetism, light, modern physics. Credit not allowed for more than one of PY 212, PY 202, and PY 208.

PY 251 Introduction to Scientific Computing 3.
Prerequisite: PY 202 or PY 208.
An introductory course in scientific computing for the physical and mathematical sciences using python and other open-source tools. Using a problem-oriented approach, students will learn the basic computing skills needed to conduct scientific research and to prepare for upper-level courses in science and engineering. Topics will include algorithm development, numerical methods, elements of programming, data analysis, and data visualization.

PY 252 Instrumental and Data Analysis for Physics 2.
Prerequisite: PY 202 or PY 208.
Digital data acquisition and lab computers (e.g. using LabView or MatLab) are tools used in nearly all current physics research labs. By using both analysis and thorough lab experimental investigation the student will learn basic skills with electronic devices (oscilloscope, power supplies, function generator, op-amps, high & low-pass filters, feedback circuits), electronic noise (measurement and analysis), and basic circuit construction methods (such as shielding/grounding, soldering).

PY 299 Special Problems in Physics 1-3.
Study in experimental or analytical topics in classical and modern physics.

PY 301 Introduction to Quantum Mechanics 3.
Prerequisite: C- or better in PY 203 or PY 407.
An introduction to wave mechanics and quantum phenomena including the Schroedinger equation for simple systems, the Hamiltonian operator, the use of commutator relations, and the application of angular momentum operators. Emphasis on mathematical tools used in wave mechanics, including complex numbers, function operators, eigenvalues and eigenvectors.

PY 328 Stellar and Galactic Astrophysics 3.
Prerequisite: PY 202 or PY 208.
Introduction to the study of stars, galaxies, and the universe. Stars and stellar evolution; interstellar medium; galaxies and galaxy clusters; cosmology. Recent developments in the understanding of neutron stars, black holes, active galaxies, quasars and inflationary cosmologies.

PY 341 Relativity, Gravitation and Cosmology 3.
Prerequisite: C- or better in PY 203 or PY 407.
Introduction to relativity, gravitation and cosmology in accordance with Einstein's special and general theories of relativity. Flat spacetime: Minkowski metric, time dilation, length contraction, doppler effect, twin paradox, and space travel. Curved spacetime: Schwarzschild metric, black holes and event horizons, particle and light motion, global positioning system, precession of planetary orbits. Cosmology: hubble law, expansion of the universe, Friedman-Robertson-Walker metric, big bang, cosmological redshift, dark matter and dark energy.

PY 401 Quantum Physics I 3.
Prerequisite: Grade of C- or better in PY 411 and grade of C- or better in PY 203.
An introduction to the basic principles of quantum physics with an emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles.

PY 402 Quantum Physics II 3.
Prerequisite: C- or better in PY 401.
An introduction to the basic principles of quantum physics with an emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles.

PY 407 Introduction to Modern Physics 3.
Prerequisite: MA 242, PY 208.
Major developments in modern physics: special relativity, origin of the quantum theory, atomic and molecular structure, radioactivity, properties of nuclei. Credit not allowed for both PY 203 and PY 407.

PY 411 Mechanics I 3.
Prerequisite: C- or better in PY 203 or C- or better in PY 407 Co-requisite: MA 341.
First semester of a two-semester sequence in particle and continuum mechanics at the intermediate level. Focuses on single-particle dynamics: Elementary Newtonian mechanics, harmonic oscillator, central force motion, conservation laws, motion in non-inertial frames, Coriolis and centrifugal forces, Lagrangian dynamics, Hamilton's equations.

PY 412 Mechanics II 3.
Prerequisite: C- or better in PY 411.
Second semester of a two-semester sequence in particle and continuum mechanics at the intermediate level. Focuses on dynamics of systems of particles and continua: Center of mass, collisions, rigid bodies, inertia tensor, principal axes, stress and strain tensors, mechanical properties of fluids and solids; Waves in discrete and continuum systems, coupled oscillators, normal modes, elements of special relativity.
PY 413 Thermal Physics 3.
Prerequisite: PY 203 or 407, MA 341.
An introduction to statistical mechanics and thermodynamics. The statistical study of physical systems emphasizing the connection between the statistical description of macroscopic systems and classical thermodynamics. Concepts of heat, internal energy, temperature and entropy. Classical and quantum statistical distributions.

PY 414 Electromagnetism I 3.
Prerequisite: C- or better in PY 203 or C- or better in PY 407, and MA 341.
First semester of a two-semester sequence. An intermediate course in electromagnetic theory using the methods of vector calculus. Electrostatic field and potential, dielectrics, solution to Laplace's and Poisson's equations, magnetic fields of steady currents.

PY 415 Electromagnetism II 3.
Prerequisite: C- or better in PY 414.

PY 452 Advanced Physics Laboratory 3.
Prerequisite: Senior standing, Physics Majors.
Introduction to laboratory electronics and instrumentation. Experiments in mechanics; electromagnetism; electronics; optics; and atomic, nuclear, plasma and solid state physics. Senior Physics students only.

PY 499 Independent Research in Physics 1-6.
Study and research in physics. Topics for experimental or theoretical investigation. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PY 501 Quantum Physics I 3.
Prerequisite: C- or better in PY 411.
Basic principles of quantum physics with emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles. PY 501 - first semester in two-semester sequence in quantum mechanics; PY 501 - second semester of sequence. Credit for both PY 401 and PY 501 is not allowed.

PY 502 Quantum Physics II 3.
Prerequisite: C- or better in PY 401.
Basic principles of quantum physics with emphasis on selected applications to atoms, molecules, solids, nuclei and elementary particles. PY 502 - second semester in two-semester sequence in quantum mechanics; PY 501, first semester of sequence. Credit for both PY 402 and PY 502 is not allowed.

PY 506 Nuclear and Subatomic Physics 3.
Prerequisite: PY 203 or 407; PY 412.
Introduction to nuclear and subatomic phenomena: properties of nuclear radiations and detectors, accelerators, nuclear forces and nuclear structure, elementary particles, fundamental symmetries and conservation laws.

PY 507 Elementary Particle Physics 3.
Prerequisite: PY 401 and PY 506.
Introduction to fundamental symmetries and dynamics of quarks and leptons. The Standard Model, Dirac equation, Feynman rules in QED and QCD, the Higgs mechanism and electroweak unification.

PY 509 General Relativity 3.
P: MA 401 and MA 405 and PY 412 and PY 415; R: Graduate Standing.
This course provides in-depth knowledge of general relativity covering: Einstein's equation, Schwarzschild metric, Kerr metric, Friedman-Robertson-Walker metric, Christoffel symbols, Killing vectors, Riemann curvature, and Ricci tensors. Theoretical computations are compared with experimental data including the precession rate of the perihelion for Mercury and the deflection in the solar eclipse, the geodetic effect and the frame dragging effect measured in Gravity Probe B experiment.

PY 511 Mechanics I 3.
Prerequisite: C- or better in PY 203 or C- or better in PY 407, and MA 341.
First semester of two-semester sequence in particle and continuum mechanics at intermediate level. Single-particle dynamics: Elementary Newtonian mechanics, harmonic oscillator, central force motion, conservation laws, motion in non-inertial frames, Coriolis and centrifugal forces, Lagrangian dynamics, Hamilton's equations. Credit for both PY 411 and PY 511 is not allowed.

PY 512 Mechanics II 3.
Prerequisite: PY 511.
Second semester of two-semester sequence in particle and continuum mechanics at intermediate level. Dynamics of systems of particles and continua: Center of mass, collisions, rigid bodies, inertia tensor, principal axes, stress and strain tensors, mechanical properties of fluids and solids; waves in discrete and continuum systems, coupled oscillators, normal modes, elements of special relativity. Credit for both PY 412 and PY 512 is not allowed.

PY 514 Electromagnetism I 3.
Prerequisite: PY 203 or PY 208, MA 341.
First semester of two-semester sequence. An intermediate course in electromagnetic theory using the methods of vector calculus. Electrostatic field and potential, dielectrics, solution to Laplace's and Poisson's equations, magnetic fields of steady currents. Credit for both PY 414 and PY 514 is not allowed.

PY 515 Electromagnetism II 3.
Prerequisite: PY 514.
Continuation of PY 514. Electromagnetic induction, magnetic fields in matter, Maxwell's equations, wave guides, radiation. Credit for both PY 415 and PY 515 is not allowed.

PY 516 Physical Optics 3.
Prerequisite: PY 415.
Physical optics with major emphasis on wave properties of light. Boundary conditions, interference and diffraction, optics of thin films, fiber optics and applications to absorption, scattering and laser operation. A background in Maxwell's equations and vector analysis is required.

PY 517 Atomic and Molecular Physics 3.
Prerequisite: PY 401, 412.
The quantum mechanical treatment of structure and spectra for atoms and molecules. The hydrogen atom, helium atom, multi-electron atoms, selection rules, diatomic and simple polyatomic molecules and nuclear magnetic resonance spectroscopy.
PY 519 Biological Physics 3.
Prerequisite: PY 413 or Graduate Standing.
This course presents the application of physics principles and methods to problems in biological systems. Important biological molecules, their structures and their processes are introduced for physical scientists. Functional mechanisms are analyzed with concepts from thermodynamics, statistical mechanics, fluid mechanics, and electrostatics. Modern experimental methods and computational approaches to molecular and cellular level biological phenomena are emphasized.

PY 525 Computational Physics 3.
Prerequisite: CSC 112 or equivalent; Corequisite: of PY 401.
Computational approach to physics problem solving using standard software relevant for physicists. Electrostatic potentials, data analysis, Monte Carlo simulations, Fourier optics, particle orbits, Schrodinger's equation. Examples and assignments for each topic chosen to complement other physics courses.

PY 528 Introduction to Plasma Physics and Fusion Energy 3.
Prerequisite: MA 401 and PY 208.
Concepts in plasma physics, basics of thermonuclear reactions; charged particle collisions, single particle motions and drifts, radiation from plasmas and plasma waves, fluid theory of plasmas, formation and heating of plasmas, plasma confinement, fusion devices and other plasma applications.

PY 543 Astrophysics 3.
Prerequisite: PY 203 or 407; PY 411.
Basic physics necessary to investigate, from observational data, internal conditions and evolution of stars. The formation and structure of spectral lines, methods of energy generation and transport, stellar structure, degeneracy, white dwarfs and neutron stars.

PY 552 Introduction To the Structure Of Solids 3.
Prerequisite: C- or better in PY 401.
Basic considerations of crystalline solids, metals, conductors and semiconductors.

PY 570 Polymer Physics 3.
Polymer microstructures, polymer solutions, polymer physical states (including amorphous polymers, crystalline polymers, polymer melts, melting of polymers, glass-transition, and other transitions), polymer blends, polymer mechanical properties, polymer viscoelasticity and flow, multicomponent polymer systems, and modern polymer topics. The physics of polymer fibers. Graduate standing or permission of instructor.

PY 581 Matter & Interactions for Teachers I 3.
First semester (mechanics) of a two-semester sequence intended to broaden and deepen in high school physics teachers their knowledge of introductory-level physics from a contemporary point of view. Includes an introduction to computational physics. Departmental permission required: normally restricted to in-service high school physics teachers.

PY 582 Matter & Interactions for Teachers II 3.
Second semester (electricity and magnetism) of a two-semester sequence intended to broaden and deepen in high school physics teachers their knowledge of introductory-level physics from a contemporary point of view. Includes an introduction to computational physics. Departmental permission required: normally restricted to in-service high school physics teachers. PY 581 prerequisite may be waived with strong background in physics and mathematics.

PY 590 Special Topics In Physics 1-6.
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits Arranged.

PY 599 Special Topics In Physics 1-6.
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits arranged.

PY 601 Seminar 1.
Reports on topics of current interest in physics. Several sections offered so that students with common research interests may be grouped together.

PY 610 Special Topics In Physics 1-6.
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits Arranged.

PY 615 Advanced Special Topics In Physics 1-6.
Advanced study in astrophysics, atomic and molecular physics, condensed matter physics, nuclear physics or plasma physics. Emphasis on new and rapidly developing research areas.

PY 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PY 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

PY 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged.

PY 711 Advanced Quantum Mechanics I 3.
Prerequisite: MA 512, PY 782.
Introduction to relativistic quantum theory of Dirac particles and the positron. Other topics including second quantization technique and its application to many-body problems, radiation theory and quantization of the electromagnetic field.

PY 712 Advanced Quantum Mechanics II 3.
Prerequisite: PY 711.
A general propagator treatment of Dirac particles, photons and scalar and vector mesons. Applications of Feynman graphs and rules illustrating basic techniques employed in treatment of electromagnetic, weak and strong interactions. Renormalization theory, the effects of radiative corrections and aspects of the general Lorentz covariant theory of quantized fields.
PY 721 Statistical Physics I 3.
Prerequisite: PY 401, PY 413.
Basic elements of kinetic theory and equilibrium statistical mechanics, both classical and quantum; applications of the techniques developed to various ideal models of noninteracting particles.

PY 722 Statistical Physics II 3.
Prerequisite: PY 721.
A continuation of PY 721, with emphasis on the static and dynamic properties of real (interacting) systems. Topics including equilibrium theory of fluids and linear response theory of time-dependent phenomena.

PY 753 Introduction To the Structure Of Solids II 3.
Prerequisite: PY 552.
The properties of semiconductors, superconductors, magnets, ferroelectrics and crystalline defects and dislocations.

PY 755 Dielectric Films and their Interfaces 3.
Prerequisite: PY 552.
This course addresses: i) local atomic structure of non-crystalline/amorphous dielectrics - experimental methods and theory; ii) classification of dielectric materials - by bond ionicity, bond density and bonding contraints/atom to discriminate between ideal covalent random networks, disrupted networks, and nano-crystallinity; iii) thermally-grown silicon dioxide and its interface with Si - the standard for alternative dielectrics; iv) electronic structure and bonding in transition metal/lathanide rare earth dielectrics; and v) intrinsic limitations on the performance and reliability of metal-oxide-semiconductor devices.

PY 781 Quantum Mechanics I 3.
Prerequisite: MA 512; PY 411 or 414; Graduate standing.
Fundamental concepts and formulations, including interpretation and techniques, and the application of theory to simple physical systems, such as the free particle, the harmonic oscillator, the particle in a potential well and central force problems. Other topics including approximation methods, identical particles and spin, transformation theory, symmetries and invariance, and an introduction to quantum theory of scattering and angular momentum.

PY 782 Quantum Mechanics II 3.
Prerequisite: MA 512; PY 411 or 414; Graduate standing.
Fundamental concepts and formulations, including interpretation and techniques, and the application of theory to simple physical systems, such as the free particle, the harmonic oscillator, the particle in a potential well and central force problems. Other topics including approximation methods, identical particles and spin, transformation theory, symmetries and invariance, and an introduction to quantum theory of scattering and angular momentum.

PY 783 Advanced Classical Mechanics I 3.
Prerequisite: MA 512, PY 412, PY 414; Graduate standing.
Introduction to theoretical physics in preparation for advanced study. Emphasis on classical mechanics, special relativity and the motion of charged particles. Topics including variational principles, Hamiltonian dynamics and canonical transformation theory, structure of the Lorentz group and elementary dynamics of unquantized fields.

PY 785 Advanced Electricity and Magnetism I 3.
Prerequisite: PY 415; Graduate standing.
Topics including techniques for solution of potential problems, development of Maxwell's equations; wave equations, energy, force and momentum relations of an electromagnetic field; covariant formulation of electrodynamics; radiation from accelerated charges.

PY 786 Advanced Electricity and Magnetism II 3.
Prerequisite: PY 415; Graduate standing.
Topics including techniques for solution of potential problems, development of Maxwell's equations; wave equations, energy, force and momentum relations of an electromagnetic field; covariant formulation of electrodynamics; radiation from accelerated charges.

PY 788 Introduction to Quantum Theory 3.
Prerequisite: PY 415.
Topics including techniques for solution of potential problems, development of Maxwell's equations; wave equations, energy, force and momentum relations of an electromagnetic field; covariant formulation of electrodynamics; radiation from accelerated charges.

Prerequisite: Doctoral student.
Research during a summer session and who will be devoting full time to thesis research.

PY 810 Special Topics In Physics 1-6.
Prerequisite: Graduate standing.
Investigations in physics under staff guidance. May consist of literature reviews, experimental or theoretical projects or special topics lectures. Credits Arranged.

PY 853 Advanced Quantum Mechanics 2-9.
Prerequisite: PY 782.
Advanced quantum mechanics. Topics will vary from year to year, but may include advanced topics in quantum mechanics, such as quantum field theory, quantum statistical mechanics, and quantum information theory.

PHY - Physiology Courses

PHY 503 General Physiology I 3.
Prerequisite: Senior standing or Graduate standing, the following courses are recommended: ZO 421, BCH 451, a year of physics.
Discussion of general principles of homeostasis, emphasizing importance of integrative action. Following systems studied: muscular, cardiovascular and nervous systems.

PHY 504 General Physiology II 3.
Prerequisite: PHY (ZO) 503.
Discussion of general principles of homeostasis, emphasizing importance of integrative action. Following systems studied: alimentary, renal, respiratory and endocrine systems.
PHY 524 Comparative Endocrinology 3.
Prerequisite: BIO 421 or PO 405.
Basic concepts of endocrinology, including functions of major endocrine glands involved in processes of growth, metabolism and reproduction.

PHY 552 Advanced Reproductive Physiology and Biotechnology 3.
Comparative approach to examining aspects of reproductive physiology in selected vertebrate species. Detailed examination of current reproductive biotechnologies and ethical issues associated with the application of reproductive biotechnologies. Credit will not be given for both ANS 452 and ANS(PHY) 552.

PHY 595 Special Topics in Physiology 1-6.

PHY 601 Physiology Seminar 1.
Prerequisite: Graduate standing.

PHY 602 Seminar In Biology Of Reproduction 2.
Prerequisite: ANS(PHY) 702.
Current topics in animal reproduction presented by reproductive physiologists from various Research Triangle institutions. Student presentations of research projects or library projects in area of animal reproduction.

PHY 610 Special Topics In Physiology 1-6.
Prerequisite: Graduate standing.

PHY 620 Special Problems In Physiology 1-6.
Prerequisite: Graduate standing.
Credits Arranged.

PHY 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PHY 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

PHY 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

PHY 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

PHY 702 Reproductive Physiology of Mammals 3.
Prerequisite: ZO 421.
Survey of reproductive strategies among vertebrates; in-depth coverage of mammalian reproductive physiology; gametogenesis, fertilization, embryonic and fetal development, parturition, puberty, neuroendocrine control mechanisms in male and female mammals.

PHY 764 Advances in Gastrointestinal Pathophysiology 3.
Prerequisite: PHY 503, PHY 504.
This course will focus on advanced gastrointestinal physiology and the pathophysiology of diseases of relevance to scientists involved in animal-related research. In particular, the course will cover the pathophysiology of ulceration, infectious diarrhea, ischemia, motility disorders, and inflammatory diseases of the gut. An in-depth review paper will be required based on recent literature regarding a specific gastrointestinal disease.

PHY 780 Mammalian Endocrinology 3.
Prerequisite: BCH 451, ZO 421.
Mammalian endocrine system with emphasis on ontogeny and anatomy of key organs; synthesis and action of hormones. Role of hormones in regulation of physiological processes such as metabolism, exocrine function, digestion, ion balance, behavior, lactation, growth and reproduction.

PHY 795 Special Topics in Physiology 1-9.

PHY 801 Physiology Seminar 1.
Prerequisite: Graduate standing.

PHY 802 Seminar In Biology Of Reproduction 2.
Prerequisite: ANS(PHY) 702.
Current topics in animal reproduction presented by reproductive physiologists from various Research Triangle institutions. Student presentations of research projects or library projects in area of animal reproduction.

PHY 810 Special Topics In Physiology 1-4.
Prerequisite: Graduate standing.

PHY 820 Special Problems In Physiology 1-6.
Prerequisite: Graduate standing.
Credits Arranged.

PHY 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PHY 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.
Plant Biology (PB)

PB 103 Perspectives on Botany 1.
Orientation to modern botany, including discussions of historical background, relation to other sciences, the nature of modern subdisciplines, professionalism and ethics, local resources of personnel and facilities, educational opportunities, and career possibilities.

PB 200 Plant Life 4.
An introduction to the structure, processes, and reproduction of higher plants, including the diversity of the plant kingdom and principles of inheritance, ecology, and evolution. Credit cannot be given for both BO 200 and BO 250.

PB 205 Our Green World 3.
Awareness and understanding of plants in the world for the non-science student. Essential fundamental concepts of plant structure, growth, processes, uses, biotechnology, evolution, environmental issues and ecology. Short field trips will be held that may require students to provide their own transportation. Credit cannot be received for both PB 205 and (PB 200 or PB 250).

PB 208 Agricultural Biotechnology: Issues and Implications 3.
Trends and issues of agricultural biotechnology in today's society are addressed while covering the basic biological science behind the technology. Applications of and policy issues associated with plant, animal, and environmental biotechnology used in the agricultural industry are examined from an interdisciplinary approach.

PB 213 Plants and Civilization 3.
This course covers plant use in ancient civilizations, including the economic, social, political, religious, culinary and medical roles of plants and plant products. Plant use in ancient cultures, including but not limited to, Amazonian, Celtic, Chinese, Egyptian, Greek, Inca, Indian, Maya, Mesopotamian, Nubian, Persian, and Roman will be discussed. Topics include foods, beverages, medicines, fibers, construction materials, psychoactive drugs, and religious symbols.

PB 215 Medicinal Plants 3.
Prerequisite: CH 101 and any one of the following courses: BIO 125, BIO 181, PB 200, ZO 150, ZO 160.
Plants and their derived pharmaceuticals in Western medicine and in herbal medicine.

PB 219 Plants in Folklore, Myth, and Religion 3.
The structural and functional biology of plants and cultural inclusions in folklore, myth, and religion. The myth/religion-plant-human culture nexus. Mythical and religious themes covered, but not limited to, are: the world tree and cosmic order; plants and the creation of Earth; the unity of plants and divine entities; the tree of life; life-giving waters and human immortality; human descent from plants; origin of food plants from humans; plants of witchcraft and magic; psychoactive plants and access to deities; solidarity between humans and plants; death and resurrection of plants and humans.

PB 220 Local Flora 3.
Prerequisite: BIO 125 or PB 200.
Structural terminology of vascular plants, field identification of plant species using popularized field guides, description of plant community types and their soil and topographic features.

PB 250 Plant Biology 4.
An introduction for Life Science majors to the ecology, structure, function, processes, reproduction and evolution of higher plants. BIO 181 and BIO 183 or BIO 125; Students may not receive credit for both BO 200 and BO 250.

PB 295 Special Topics in Botany 1-4.
Trial offerings of new or experimental courses in Botany at the early undergraduate level.

PB 321 Introduction to Whole Plant Physiology 3.
Prerequisite: (BIO 183 or PB 200 or PB 250) and CH 101/102.
Physiology of higher plants with emphasis on whole plant aspects including structure-function relationships, water and solute movement, energy sources and needs, plant growth and development, and the impact of plant physiology findings on agriculture. Students cannot receive credit for both PB 321 and PB 421.

PB 345 Economic Botany 3.
Prerequisite: BIO 181 or PB 200 or PB 250.
This course covers plants of economic importance that have been valued by societies regionally, nationally and globally from the modern era to the present day. Topics include, but are not limited to, plant species used as food, spices, beverages, oils, fibers, paper, dyes, perfumes, body care, construction materials, fuels and ornamentals. Aspects related to the botany and ethnobotany of economically important plant species will be discussed including taxonomy, anatomy, physiology, ecology, conservation, human uses, social and environmental issues, and roles in the economy.

PB 346 Economic Botany Lab 1.
Prerequisite: BIO 181 or PB 200 or PB 250; Co-requisite: PB 345.
This lab course explores plants and plant products of economic importance through hands-on activities. Aspects related to the botany and ethnobotany of economically important plant species will be covered including taxonomy, anatomy, physiology, ecology, conservation, human uses, social and environmental issues, and roles in the economy.
PB 400 Plant Diversity and Evolution 4.
Prerequisite: BIO 181 or PB 200 or PB 250.
Diversity, morphology, taxonomy, and evolutionary history of living and fossil plants including fungi, algae, bryophytes, pteridophytes, gymnosperms, and angiosperms. Two one-day weekend field trips required.

PB 403 Systematic Botany 4.
Prerequisite: PB 200, PB 250, BIO 183, Junior standing.
The course introduces basic and contemporary systematic principles and methods as applied to vascular plants, with emphasis on flowering plants. It covers classification, identification, phylogenetics, and molecular approaches, and surveys important and common plant families representing major groups of vascular plants.

PB 405 Wetland Flora 3.
Prerequisite: PB 200 or PB 250 or PB 403 or FOR 212.
Plant morphological terminology and identifications of wetland plants; discussion of wetland flora, plant communities, functions and values of North Carolina wetland types; several one-day weekend field trips required.

PB 413 Plant Anatomy 2.
Prerequisite: PB 200 or PB 250 or PB 321 or PB 421.
Organelles, cells, tissues and organs of flowering plants and selected gymnosperms. Emphasis placed on developmental patterns and structural adaptations for survival. Laboratory focuses on dissection, histochemistry, and imaging of plant cells and tissues. Students cannot reserve credit for both PB 413 and PB 513.

PB 414 Cell Biology 3.
Prerequisite: C- or better in BIO 183 and (CH 221 or CH 225).
The chemical and physical bases of cellular structure and function with emphasis on methods and interpretations.

PB 421 Plant Physiology 3.
Prerequisite: BIO 183 or ZO 160, or PB 200 and CH 220 or CH 221 or CH 225.
Physiology of higher plants with emphasis on biochemical, cell biological and molecular aspects of how plants function. Unique aspects of regulation of plant metabolism including photosynthesis, respiration, nitrogen fixation, cell wall biosynthesis, growth and stress responses will be emphasized. The course is intended for students interested in postgraduate studies in plant biology. Students cannot receive credit for both PB 321 and PB 421.

PB 445 Paleobotany 4.
Prerequisite: BIO 181 or MEA 102.
Morphologic, taxonomic, geologic and evolutionary relationships of fossil plants; emphasis on vascular plants; discussions of taphonomy, biogeography and palynology. Requires weekend field trips at student expense. Credit will not be allowed for both BO 445 and BO 545.

PB 464 Rare Plants of North Carolina 3.
Prerequisite: One of the following: (PB 200, PB220, PB 403, or PB 405).
This course provides a taxonomic survey of the rare plants of North Carolina, focusing primarily on federally- and secondarily on state-listed species. Particular attention will be placed on: (1) the identification of rare species, their congers, and morphologically similar species, (2) the biogeography of rare species, (3) optimum survey windows, and (4) the conservation biology of select taxa. Two Saturday field trips required. Junior level or higher. Students cannot receive credit for both PB 464 and PB 564.

PB 480 Introduction to Plant Biotechnology 3.
Prerequisite: BCH 454 or BIT 410 or CS 211 or GN 311 or PB/BIO 414 or PB 421.
Introduction to gene cloning, plant tissue culture and transformation, and the development of agriculturally important transgenic traits. Critical thinking, case studies, and discussions are used to examine global approaches to the regulation and risks of genetically-modified organisms, plant and gene patents, and the consequences of these factors on food sovereignty and trade. Students cannot receive credit for both PB 480 and PB 580.

PB 481 Plant Tissue Culture and Transformation 2.
Prerequisite: BIT 360 or MB 409 or BCH 454 or ZO 480.
Basic techniques in plant tissue culture and transformation. Empirical approaches to techniques in plant tissue culture, designing transgenes for expression in specific plant cell organelles and tissues, use of reporter genes to optimize transformation, and troubleshooting transformation. Laboratory sessions provide hands-on experience with plant tissue culture and transformation. Use of reporter genes, fluorescence microscopy and digital imaging. Half semester course, first part.

PB 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

PB 493 SP Problems in BO 1-6.
A learning experience within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

PB 495 Special Topics in Botany 1-6.
Prerequisite: 8 hrs. of Botany courses.
Individualized study, under faculty supervision, of botanical topics in the student's area of interest and not covered in existing courses. Development of a new course on a trial basis.

PB 501 Biology of Plant Pathogens 3.
Prerequisite: PP 315, or PP 318, or an introductory course in microbiology.
Biology of microbes that cause plant diseases. The ecology, genetics, physiology, taxonomy, and mechanisms of parasitism, pathogenicity and virulence of bacteria (and other prokaryotes), fungi (and oomycetes), nematodes, and viruses that cause plant diseases. Prepares graduate students for advanced courses in plant pathology, host-parasite interactions, and provides a knowledge base for students in other disciplines involved with plant pathogens or who seek to broaden their knowledge of microbes.

PB 503 Systematic Botany 4.
Prerequisite: PB 200, PB 250, BIO 183, Junior standing.
The course introduces basic and contemporary systematic principles and methods as applied to vascular plants, with emphasis on flowering plants. It covers classification, identification, phylogenetics, and molecular approaches, and surveys important and common plant families representing major groups of vascular plants.
PB 513 Plant Anatomy 2.
Prerequisite: PB 200 or PB 250 or PB 321 or PB 421.
Organelles, cells, tissues and organs of flowering plants and selected gymnosperms. Emphasis placed on developmental patterns and structural adaptations for survival. Laboratory focuses on dissection, histochemistry, and imaging of plant cells and tissues. Students cannot receive credit for both PB 413 and PB 513.

PB 545 Paleobotany 4.
Prerequisite: PB 400, 403, 413, 544, MEA 423.
Morphologic, taxonomic, geologic and evolutionary relationships of fossil plants; emphasis on vascular plants; discussions of taphonomy, biogeography and palynology. Required field trips.

PB 564 Rare Plants of North Carolina 3.
Prerequisite: One of the following: (PB 200, PB220, PB 403, or PB 405).
This course provides a taxonomic survey of the rare plants of North Carolina, focusing primarily on federally- and secondarily on state-listed species. Particular attention will be placed on: (1) the identification of rare species, their congeners, and morphologically similar species, (2) the biogeography of rare species, (3) optimum survey windows, and (4) the conservation biology of select taxa. Two Saturday field trips required. Junior level or higher. Students cannot receive credit for both PB 464 and PB 564.

Prerequisite: PB 360 or ZO 260.
Consideration of structure and function of terrestrial vascular plant communities, with emphasis on both classical and recent research. Measurement and description of community properties, classification, ordination, vegetation pattern in relation to environment, ecological succession and a survey of vegetation of North America.

PB 570 Plant Functional Ecology 3.
Prerequisite: PB/BIO 360.
Mechanisms by which plants interact with their environment, with an emphasis on the role of physiological, morphological, and life history traits, and the evolution of these traits.

PB 575 Introduction to Mycology 4.

PB 580 Introduction to Plant Biotechnology 3.
Prerequisite: BCH 454 or BIT 410 or CS 211 or GN 311 or PB/BIO 414 or PB 421.
Introduction to gene cloning, plant tissue culture and transformation, and the development of agriculturally important transgenic traits. Critical thinking, case studies, and discussions are used to examine global approaches to the regulation and risks of genetically modified organisms, plant and gene patents, and the consequences of these factors on food sovereignty and trade. Students cannot receive credit for both PB 480 and PB 580.

PB 595 Special Topics Botany 1-6.

PB 601 Botany Seminar 1.

PB 620 Special Problems In Botany 1-6.
Directed research in some phase of botany other than a thesis problem, but designed to provide experience and training in research. Credits Arranged.

PB 624 Topical Problems 1-4.
Discussions and readings on problems of current interest in fields of ecology, anatomy and morphology, taxonomy, plant physiology and cell biology. May be repeated with a change in topic for a maximum of six credits.

PB 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PB 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's Student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

PB 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's Student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

PB 690 Master's Examination 1-9.
Prerequisite: Master's Student.
For students in non-thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

PB 693 Master's Supervised Research 1-9.
Prerequisite: Master's Student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's Student.
Thesis Research.

PB 696 Summer Thesis Research 1.
Prerequisite: Master's Student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's Student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

PB 704 Plant Nomenclature 1.
A practical foundation in plant nomenclature and nomenclatural references. Emphasis on the evolution of international rules for naming plant taxa and their application in both wild and cultivated plants. Nomenclature applications used in patents, cultivar releases and journal articles. Taught mid-semester. Taught five weeks of semester.
PB 730 Fungal Genetics and Physiology 3.
Prerequisite: BCH 451, PB 575, GN 411 or PP 501.
Basic concepts of genetics and physiology of fungi, with emphasis on saprophytic and plant pathogenic mycelial fungi. Current literature on evolution, cell structure, growth and development, gene expression, metabolism, sexual and asexual reproduction and incompatibility systems. Laboratory exercises on mutant isolation, sexual and parasexual analysis, genetic transformation, and RFLP and isozyme analysis.

PB 733 Plant Growth and Development 3.
Prerequisite: PB(ZO) 414 or PB 421, organic chemistry.
Advanced course in plant physiology covering plant growth, development, differentiation, senescence and biological control mechanisms.

PB 751 Advanced Plant Physiology I 3.
Prerequisite: PB 421.
Cellular mechanisms and regulatory features related to plant respiration, photosynthesis, sulfur metabolism, nitrogen fixation and metabolism, and signal transduction. One of two courses covering field of plant physiology.

PB 774 Phycology 3.
Prerequisite: BIO 125 or PB 200.
Introduction to taxonomy, morphology, reproduction and ecological importance of organisms which may be included in the algae. Attention to local freshwater flow and physiology of selected species in relation to algal blooms, water quality and nutrient loading in aquatic habitats.

PB 780 Plant Molecular Biology 3.
Prerequisite: BCH 451, GN 411.
Molecular analysis of plant growth and development. Molecular techniques and their application to understanding control of gene expression in plants.

PB 795 Special Topics Botany 1-6.

PB 801 Seminar 1.

PB 820 Special Problems 1-6.
Directed research in some phase of botany other than a thesis problem, but designed to provide experience and training in research. Credits Arranged.

PB 824 Topical Problems 1-4.
Discussions and readings on problems of current interest in fields of ecology, anatomy and morphology, taxonomy, plant physiology and cell biology. May be repeated with a change in topic for a maximum of six credits.

PB 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral Student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PB 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral Student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

PB 896 Summer Dissertation Research 1.
Prerequisite: Doctoral Student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral Student.
For students who have completed all credit hours, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

**Plant Pathology (PP)**

**PP - Plant Pathology Courses**

**PP 144 Weeds & Diseases of Ornamentals 3.**
The objective of this course is to give students a fundamental and practical understanding of weed, disease, and pesticide management in the ornamental industries in North Carolina. Agricultural Institute students only.

**PP 150 Introduction to Plant Molecular Biology 3.**
Hands-on introduction to modern molecular biology techniques. Isolation of SNA from tobacco leaves, isolating a plant gene through polymerase chain reaction (PCR), cloning DNA fragments in plasmid vectors, bacterial transformation and plasmid DNA purification, restriction digestion and gel electrophoresis, gene transfer and expression of reporter genes in plant cell lines through a biolistic gene gun. Field trips, poster assignment and poster presentation are mandatory. This course is part of the Summer College in Biotechnology and Life Sciences (SCIBLS) and other pre-college, transitional and early-college programs. Students must have no more than 30 credit hours. Department approval required.

**PP 154 Turf Weed and Disease Management 3.**
General principles in turfgrass weed and disease development and management programs. Different weeds, their life cycles, management techniques, and factors affecting herbicide application performance will be covered. Students will learn the causes, development, identification and management of turfgrass diseases. Laboratory includes weed identification and herbicide application methods. Certain laboratory exercises will require personal transportation to Lake Wheeler Road Turf Field Lab unless otherwise specified by the lab instructors. The course is restricted to AGI students only.

**PP 155 Diseases of Ornamentals and Turfgrasses 3.**
Causes, development, identification and management of diseases of greenhouses and landscape ornamentals and turfgrasses. WARFIELD.

**PP 222 Kingdom of Fungi 3.**
Prerequisite: Any 100-level course in Biology or 200-level course in Plant Biology.
Influence and impact of fungi in our world. The role of fungi in history, ecology, medicine, human and plant diseases, industry, food and politics. Mushrooms, molds, mildews and symbiosis.
PP 241 The Worm’s Tale: Parasites In Our Midst 3.
This is a 3 credit hour survey course on the impact of parasites on society, including development and exploration, wars and expansion, agriculture, health and medicine, economic impacts, political impacts, and attempts at control/management. From the fiery serpent to the scourge of malaria, parasitic organisms have played a significant, and sometimes pivotal role in the development and progress of human society. This course presents an overview that provides students the necessary information and resources to understand this ubiquitous and critically important group of organisms. Parasites represent a significant hurdle to overcome as global society continue to move forward.

PP 315 Principles of Plant Pathology 4.
Fundamental principles of plant pathology with emphasis on disease etiology, nature of pathogenesis, ecology of host/parasite interaction, epidemiology of plant diseases, current strategies and practices for integrated disease control.

PP 318 Forest Pathology 3.
Prerequisite: PB 200.
Major diseases of forest trees and deterioration of wood products emphasizing principles of plant pathology; diagnosis; nature, physiology, ecology, and dissemination of disease-causing agents; mechanisms of pathogenesis; epidemiology and environmental influences; principles and practices of control.

PP 470 Advanced Turfgrass Pest Management 2.
Prerequisite: C- or better in CS 200.
Characteristics and ecology of turfgrass weed, insect, and disease pests; identification and diagnosis of turfgrass pests, strategies for managing pests including cultural, mechanical, biological, and chemical methods; development of integrated pest management programs, characteristics and modes of action for herbicides, insecticides, fungicides, and plant growth regulators; behavior and fate of pesticides in soil; and the development and management of pesticide resistant pest populations.

PP 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

PP 493 Special Problems in Plant Pathology 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

PP 495 Special Topics in Plant Pathology 1-3.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

PP 501 Biology of Plant Pathogens 3.
Prerequisite: PP 315, or PP 318, or an introductory course in microbiology.
Biology of microbes that cause plant diseases. The ecology, genetics, physiology, taxonomy, and mechanisms of parasitism, pathogenicity and virulence of bacteria (and other prokaryotes), fungi (and oomycetes), nematodes, and viruses that cause plant diseases. Prepares graduate students for advanced courses in plant pathology, host-parasite interactions, and provides a knowledge base for students in other disciplines involved with plant pathogens or who seek to broaden their knowledge of microbes.

PP 502 Plant Disease: Methods & Diagnosis 2.
Prerequisite: PP 315.
Introduction to the basic principles of disease causality in plants and the methodology for the study and diagnosis of plant diseases caused by fungi. Identification of plant-pathogenic fungi. Research project, disease profiles and field trips are required.

PP 506 Epidemiology and Plant Disease Control 3.
Prerequisite: PP 315 or PP 318.
Consideration of fundamental concepts and principles of epidemiology as applied to modern strategies of plant disease control. Special consideration given to evaluation of current techniques for control of fungal, bacterial, viral and nematode pathogens in an integrated crop protection system.

PP 530 Agriculture, Ethics and the Environment 3.
Case studies in ethical theory and moral issues in agriculture and life sciences research including ethical theories, populations, food, ozone depletion, soil quality, sustainable and organic agriculture, plant biotechnology and biodiversity, animal rights and welfare, water quality, pesticides, risk assessment, biologically-based pest management, environmental policy and research ethics. Students are active participants and use role playing to present a forum.

PP 540 Tropical Plant Pathology 2.
Class introduces students to agriculture in the tropics and disease on tropical crops including cacao, banana, potato, root vegetables and coffee will be given. Trade issues relevant to US and Central American farmers are discussed. A week long trip Costa Rice in the summer and tours of coffee, banana, pineapple, tropical fruit, cacao and vegetable farms in the country is required. Learn about the diseases, social and political issues facing farmers in the developing world.

PP 575 Introduction to Mycology 4.

PP 590 Special Topics 1-3.
PP 601 Seminar 1.
Discussion of assigned phytopathological topics.

PP 610 Special Topics 1-6.
PP 615 Advanced Special Topics in Plant Pathology 1-6.
Prerequisite: PP 501, 502, Corequisite: ST 511.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

PP 620 Special Problems 1-6.
Investigation of special problems in plant pathology not related to thesis problem. Investigations may consist of original research and/or literature survey.
PP 685 Master’s Supervised Teaching 1-3.
Prerequisite: Master’s student.
Teaching experience under the mentorship of faculty who assist the
student in planning for the teaching assignment, observe and provide
feedback to the student during the teaching assignment and evaluate the
student upon completion of the assignment.

PP 690 Master’s Examination 1-9.
Prerequisite: Master’s student.
For students in non thesis master’s programs who have completed all
other requirements of the degree except preparing for and taking the final
master’s exam.

PP 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member of
the Graduate Faculty.

Prerequisite: Master’s student.
Thesis research.

Prerequisite: Graduate standing.
Original research in plant pathology.

PP 707 Plant Microbe Interactions 3.
Prerequisite: PP 501.
Fundamental concepts and current status of research on the physiology,
biochemistry and molecular biology of host-pathogen interactions during
plant disease. Topics include recognition, penetration and colonization,
pathogenicity and virulence determinants, resistance mechanisms,
sign transduction, programmed cell death, and other current topics.
Information presented in context of viral-, bacterial-, fungal-and
nematode-plan interactions. Credit cannot be received for both PP 507
and PP 707.

This course will introduce nonparametric and model-based methods
for making inferences on population processes (mutation, migration,
drift, recombination, and selection). The goal is to provide a conceptual
overview of these methods and hands-on training on how to implement
and interpret the results. Sample data sets in computer laboratories
will integrate summary statistic, cladistic, coalescent, and bayesian
approaches to examine population processes in different pathosystems
with specific emphasis on eukaryotic microbes, viruses and bacteria.

PP 720 Ecology of Soil Ecosystems 3.
Prerequisite: One course in: (SSC 332, SSC 511, SSC 521, or SSC 532),
or ecology (BO 360 or CS 430), or microbiology (MB 351), or consent of
instructor.

An interdisciplinary course primarily focusing on the interactions between
soil organisms and their environment, and the ecological consequences
of these diverse complex interactions. A broad range of topics, including
soil biodiversity, plant-microbial interactions, trophic interactions, energy
flow and nutrient cycling, and microbial controls over plant and ecosystem
responses to natural and anthropogenic perturbation (e.g., tillage or global
change components) are addressed.

PP 728 Soilborne Plant Pathogens 3.
Prerequisite: PP 501, 502.
In-depth study of ecology of soilborne fungal and bacterial pathogens
inducing root and wilt diseases in plants. Concepts and principles
including but not limited to the rhizosphere, inoculum potential, soil
fungistasis, survival, root disease models and biological control.

PP 730 Fungal Genetics and Physiology 3.
Prerequisite: BCH 451, BO 775, GN 411 or PP 501.
Basic concepts of genetics and physiology of fungi, with emphasis on
saprophytic and plant pathogenic mycelial fungi. Current literature on
evolution, cell structure, growth and development, gene expression,
metabolism, sexual and asexual reproduction and incompatibility
systems. Laboratory exercises on mutant isolation, sexual and
parasexual analysis, genetic transformation, and RFLP and isozyme
analysis.

P: Basic Undergraduate Level Genetics Class.
This class deals with the major concepts in plant disease resistance:
Its molecular and biochemical bases, its effectiveness and methods of
deployment and conventional and transgenic breeding methods used to
incorporate improved disease resistance into crop species.

PP 790 Special Topics 1-6.

PP 795 Advanced Special Topics 1.

PP 801 Seminar In Plant Pathology 1.
Discussion of assigned phytopathological topics.

PP 810 Special Topics 1-6.

PP 815 Advanced Special Topics 1-6.

PP 820 Special Problems In Plant Pathology 1-6.
Investigation of special problems in plant pathology not related to thesis
problem. Investigations may consist of original research and/or literature
survey.

PP 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the
student in planning for the teaching assignment, observe and provide
feedback to the student during the teaching assignment, and evaluate the
student upon completion of the assignment.

PP 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral
preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of
the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

PP 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course
work during a summer session and who will be devoting full time to thesis
research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time
enrollment, preliminary examination, and residency requirements for the
doctoral degree and are writing and defending their dissertations.
PS - Political Science Courses

PS 101 Internet Research 1.
Tools and techniques for conducting Internet research and electronic literature reviews. Documentation and ethics of using and citing information sources. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PS 102 Data Analysis 1.
Statistical analysis of governmental and survey data. Introduction to data sets and collecting, computerizing and analyzing political and social data.

PS 103 Designing Political Web Pages 1.
Principles of effective internet communication in political professions, for constituency contact and grassroots mobilization, and use of web documents by politicians and political organizations. Design of web page documents and creation of internet directories.

PS 201 American Politics and Government 3.
Analysis of American political institutions and processes, including the constitution, political culture, campaigns and elections, political parties, interest groups, the media, the president, congress, the federal courts, and public policy. Discussion of contemporary and controversial issues in American politics. Emphasis on placing current issues in comparative and historical perspective where relevant.

PS 202 State and Local Government 3.
State and local governments within the context of the American federal system. Special emphasis on federalism, the constitutional/legal relationships between state and local governments, and the institutions, organizational forms, and political processes in American state and local government.

PS 203 Introduction to Nonprofits 3.
Development of nonprofit organizations and the contributions of nonprofits in the U.S., other countries, and the international community; political, social, and economic roles of nonprofits; nonprofit governance; partnerships with government and other nonprofits; types of organizations in the nonprofit sector; contemporary policy issues. Service project with minor transportation costs.

PS 204 Problems of American Democracy 3.
Political problems in America from the perspective of political theory. Democracy, economics and politics, racial and sexual equality, civil disobedience, and individual freedom.

PS 205 Law and Justice 3.
Role of law from practical, political and theoretical perspective; linkages between law and justice in addressing social problems, such as gun control; drug legalization; civil disobedience; gender equality; and property rights; the impact of media on public perceptions of law and justice.

PS 231 Introduction to International Relations 3.
Evolution of relations among nations and of the roles of the United Nations and other international institutions, including changes in the world political system since the end of the cold war.

PS 236 Issues in Global Politics 3.
Selected problems facing the world community, related political issues, and international responses to them, including international trade, economic development, wars, arms control, terrorism, ethnic conflict, human rights, status of women, population growth, food security, and environmental degradation.

PS 241 Introduction to Comparative Politics 3.
Introductory comparative analysis of a selected variety of political systems always including some developed democracies, some communist states and some developing countries. A minimum familiarity with the American political system is assumed.

PS 298 Special Topics in Political Science 1-6.
Experimental course at the freshman and sophomore levels.

PS 301 The Presidency and Congress 3.
Prerequisite: PS 201.
Historical development, selection, and internal organization of the presidency and congress. Discussion of the relations between the branches and the influence of public opinion, interest groups and parties on the federal government. Analysis of the legislative process.

PS 302 Campaigns and Elections in the US Political System 3.
Prerequisite: PS 201.
Campaigns and elections in the United States with emphasis on presidential and congressional primary and general elections. Development of theoretical propositions concerning how and why people vote, how and why candidates campaign, and behavioral reasons underlying candidates' successes and failures. Special emphasis on the role of the mass media in the electoral process.

PS 303 Race in U.S. Politics 3.
Prerequisite: Sophomore standing.
Race in American politics with emphasis on the African-American political experience: civil rights legislation, voting rights, political representation, campaigns and party politics, survey attitudes, and public policies including affirmative action.

PS 305 The Justice System in the American Political Process 3.
Criminal justice process and civil justice system in the American judiciary, including court organization and legal professionals such as police, attorneys and judges; formulation and implementation of policies by law enforcement and the courts; impact of political system upon police, attorneys and judges; interaction between public and legal professionals in judicial decision making. Students who have successfully completed PS 306 or PS 311 may not receive credit for PS 305.

PS 306 Gender and Politics in the United States 3.
Prerequisite: PS 201.
This course explores the role of gender in contemporary American politics. The course examines the historical course of gender politics to see how we have arrived at the present state. It investigates the activities that women and men play in modern politics-voting, running for office, serving in office, etc., and how women and men perform these activities in different ways. The course also focuses on major areas of public policy that affect women and men in different ways.

PS 307 Introduction to Criminal Law in the United States 3.
Principles underlying the criminal law in the United States and classification of crimes, criminal act, factors affecting criminal responsibility and various types of offenses. Observation of state and federal court sessions.

PS 308 Supreme Court and Public Policy 3.
The role of the Supreme Court in American politics, with emphasis on the use of litigation as a form of political activity. Readings include relevant court cases as well as descriptions of the Supreme Court in action.

PS 309 Equality and Justice in United States Law 3.
Equality and justice in American law; federal and state court interpretation of constitutional and statutory law. Topics include racial justice; prisoners' rights and just punishments; nontraditional families and reproductive technologies; gay rights; immigration law; criminal justice practices.
PS 310 Public Policy 3.
Introduction to public policy formulation and analysis, including agenda-setting strategies, problems of legitimation, the appropriations process, implementation, evaluation, resolution, and termination.

PS 312 Introduction to Public Administration 3.
Administration in city, state and national governments: effectiveness and responsiveness, involvement in policy areas, and issues of ethics and responsibilities.

PS 313 Criminal Justice Policy 3.
Prerequisite: PS 201.
This course covers the basic policies and controversies in criminal justice in the United States. The course will explore how criminal justice policies get made, why they get made, how well or poorly they work, and what we can do better. The course will examine primarily longstanding areas of policy debate, e.g., illegal drugs, prisons, capital punishments, etc., but we will also pay attention to policy debates in the news. The course will also pay special attention to the intersection of race and social class with our modern criminal justice policies.

PS 314 Science, Technology and Public Policy 3.
Societal impacts of science and technology. Structures and processes for formulation, implementation, evaluation of United States science and technology policy. Political implications of selected issues in science and technology policy studies.

PS 320 U.S. Environmental Law and Politics 3.
Emergence of the environment as an issue in United States politics. Law and policy pertaining to air and water pollution, land-use, water, energy, toxic substances, and wilderness. Roles of national and state governments, scientists, corporations, and citizens groups in addressing environmental problems.

PS 331 U.S. Foreign Policy 3.
The content, formulation, and execution of U.S. foreign policy during the postwar period, with concentration on major issues and trends, the instruments for implementing foreign policy, and analysis of the policy-making process.

PS 335 International Law 3.
Usefulness and limitations of international law, including obligations and immunities of sovereign states, non-state actors, peaceful settlement of disputes, human rights, laws of war, and recent international war crimes tribunals. Emphasis on individual case decisions in U.S. and international courts.

PS 336 Global Environmental Politics 3.
International politics, laws, and policies pertaining to global environmental problems in the realms of population, pollution, climate change, biological diversity, forests, oceans, and fisheries.

PS 339 Politics of the World Economy 3.
Politics of international trade and payments, including barriers to trade, dispute settlement, multinational corporations, financial crises, international economic institutions and the problems of economic underdevelopment.

PS 341 European Politics 3.
Comprehensive analysis of the interests, institutions and processes that determine political stability and economic security in Europe, including the political and economic development of Europe, the role of parties and party politics, the institutions and politics of the European Union.

PS 342 Politics of China and Japan 3.
Politics, public policy, and foreign affairs of China and Japan.

PS 343 Government and Politics in South Asia 3.
Survey of government structures, politics, foreign policies and economic policies of India, Pakistan, Bangladesh and Sri Lanka. Democratization; religious, ethnic and sectarian conflicts; nuclear proliferation; Kashmir conflict; and economic development.

PS 345 Governments and Politics in the Middle East 3.
Historical, geographic, religious, and political-economic factors of the Middle East. Particular attention is given to the internal politics of selected countries, as well as issues of international concern.

PS 361 Introduction to Political Theory 3.
Nature and purpose of politics, as treated by such writers as Plato, Aristotle, St. Augustine, Machiavelli, Locke, Rousseau, Mill, Marx, and Nietzsche.

PS 362 American Political Thought 3.
American ideas and institutions as viewed from the perspective of great American political thinkers, such as Frederick Douglass, Thomas Jefferson, James Madison, Alexander Hamilton, Henry David Thoreau, Abraham Lincoln, Franklin Roosevelt, and Malcolm X.

PS 371 Research Methodology of Political Science 3.
Prerequisite: ST 311 or (ST301 and ST302).
Research methods in social science and quantitative analysis in political science and public policy including research design, data collection, statistical analysis and computer applications.

PS 391 Internship in Political Science 1-6.
Internship in a governmental agency, interest group, or like organization involves seminar or formal report. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PS 398 Special Topics in Political Science 3.
For topics not part of regular course offerings, or offering of new courses on a trial basis. May be taken up to three times provided the topics are different.

PS 401 American Parties and Interest Groups 3.
American parties and interest groups as instruments for mobilizing electorates, shifting public opinion and setting political priorities. The role of parties and interest groups in operating and financing elections. Strategies, tactics and problems of parties and interest groups influencing elected officials, bureaucrats and the policy process.

PS 409 Black Political Participation in America 3.
African American political participation in the United States; political culture, socialization, and mobilization, with a focus on the interaction between African Americans and actors, institutions, processes, and policies of the American political system.

PS 411 Public Opinion and the Media in American Politics 3.
Prerequisite: PS 201.
Nature, content, origins, and effects of public opinion in the American political system; role of the mass media in articulating and shaping public opinion; issues concerning measurement of public opinion.

PS 415 Administration of Justice 3.
Junior standing or above.
Politics and administration in the American system of justice. Credit will not be given for both PS 415 and PA 515.
PS 418 Gender Law and Policies 3.
Prerequisite: 3 hours of Political Science.
Law and policy pertaining to contemporary gender issues. Examination of agenda setting, policy formation, implementation, judicial interpretation and evaluation of selected issues, such as reproductive policies, equal employment and sexual abuse.

PS 431 The United Nations and Global Order 3.
Prerequisite: PS 231 or PS 236 or PS 335.
United Nations in contemporary world politics. Functions and operation of central organs, commissions, and specialized agencies. Role in addressing global issues including peacekeeping, arms control, human rights, economic and social development, and environment.

PS 432 Violence, Terrorism, and Public Policy 3.
Prerequisite: SOC 300 or PS 371.
The course examines interpersonal and group violence in contemporary societies and the causes for its occurrences. Specific forms of violence that will be examined include domestic violence, gangs, homicide, and terrorism, domestically and internationally. Throughout the course students will use data to critically evaluate policies and practices to prevent and control violence and will examine potential solutions to the problems of violence.

PS 433 Global Problems and Policies 3.
Prerequisite: PS 231 or PS 236 or PS 241.
Critical analysis of issues and events in world politics, including terrorism, drug trafficking and money laundering, transmission of infectious diseases, democratization, globalization and economic development.

Prerequisite: PS 331.
Formulation and implementation of United States national security policy, including its military, political and economic dimensions. Historical evolution of US policy primarily from the end of World War II through the end of the Cold War and to its contemporary context.

PS 443 Seminar in Latin American & Caribbean Politics 3.
Prerequisite: Six hours of Political Science including PS 231.
Comparative political development in Latin America and the Caribbean. Emphasis on democratization and implications for US foreign policy. Credit cannot be given for both PS 443 and PS 543.

PS 445 Comparative Systems of Law and Justice 3.
Junior standing or above.
Legal culture and administration of justice in various countries and in the U.S. Emphasis on the impact of legal ideology on crime, political justice, police administration, corrections and judicial process. Credit will not be given for both PS 445 and PS 545.

PS 462 Seminar in Political Theory 3.
Prerequisite: PS 361 or Consent of Instructor.
A special area in political theory through selected texts, independent research, and seminar reports. Topics vary from year to year, such as ancient and modern political thought, democratic theory, and political theory in literature.

PS 463 Public Choice and Political Institutions 3.
Prerequisite: Junior standing or Senior standing, Political Science Majors, 12 hours of Political Science Courses.
Examination of public choice approach to political science. Analysis of political institutions and how they modify human behavior and influence political and policy outcomes. Fulfills department's undergraduate senior seminar requirement.

PS 471 Public Opinion Research Methodology 3.
Survey research methodology in public opinion polling, campaign management, media and market research, needs assessment and program evaluation. Topics include questionnaire design, survey sampling, computer applications, and data analysis. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PS 490 Readings and Research in Political Science 1-6.
Extensive readings or research in political science under direct faculty supervision. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PS 492 Honors Readings and Thesis in Political Science 1-6.
Prerequisite: Admission to Honors Program.
Independent reading and preparation of an honors thesis in political science.

PS 498 Special Topics in Political Science 1-6.
Prerequisite: Six hours of Political Science.
Detailed investigation of a topic. Topic and mode of study determined by the student and a faculty member.

PS 502 The Legislative Process 3.
Prerequisite: Advanced Undergraduate standing including 12 hrs. of PS, Graduate standing or PBS status.
The formulation of public policy from institutional and behavioral viewpoints. Important current legislative problems at congressional and state legislative levels selected and serve as basis for analyzing legislative process.

PS 506 United States Constitutional Law 3.
Prerequisite: 12 hours of PS or Graduate standing or PBS status.
Basic constitutional doctrines, including fundamental law, judicial review, individual rights and political privileges and national and state power. Special attention given to application of these doctrines to regulation of business, agriculture and labor and to rights safeguarded by First, Fifth and Fourteenth Amendments to the Constitution.

PS 507 Civil Liberties In the United States 3.
Prerequisite: 12 hours of PS or Graduate standing or PBS status.
Leading constitutional cases in civil liberties and individual rights along with writings of leading commentators.

PS 530 Seminar In International Relations 3.
May be taken for up to six hours credit. In-depth examination of a topic within larger field of international politics to be selected by instructor for each semester from subjects pertaining to interstate relations, international law and organization, regional politics, foreign and security policy or global issues. Students undertake substantial independent research project.

PS 531 International Law 3.
Prerequisite: Graduate standing or Advanced Undergraduate standing.
Sources and subjects of international law, domestic and international jurisdictions, judicial settlement, legal and illegal uses of force and substance of law in selected policy areas.
PS 532 Seminar in Global Governance 3.
The politics of global governance, with emphasis on the role of intergovernmental organizations, non-governmental organizations, international regimes, and supranational institutions, and the comparative analysis of different governance structures. Includes study of the mechanisms of international cooperation between states and their citizens in a variety of issue areas, such as trade, money, development, humanitarianism, the environment, human rights, and security. Graduate standing.

PS 533 Global Problems and Policy 3.
Prerequisite: Advanced Undergraduate standing including 12 hours of PS program, Graduate standing or PBS status.
International policy processes and policy responses to problems of global scope including role of international law. Consideration given to economic development, human rights and other policy problems selected for specific semesters. Independent research on a global policy problem of student's choice.

Human rights policies and politics within the modern global society; the interplay of international organizations, governments and non-governmental actors in promoting and undermining international human rights; examines how domestic politics, sovereignty, cultural norms, religion, geo-political competition, past colonialism, and economic considerations affect efforts to address human rights violations in different countries; human rights issues such as genocide, humanitarian intervention, women and gender issues, refugees, transitional justice or reconciliation, ethnic/racial divisions, human trafficking, etc. Graduate standing.

PS 536 Global Environmental Law and Policy 3.
Prerequisite: Graduate standing or PBS status.
International organizations, laws and policies addressing global environmental problems including: population growth, atmospheric pollution, climate change, use of oceans, forests and biodiversity. Relationship between environment and Third World economic development.

PS 539 International Political Economy 3.
Prerequisite: Advanced Undergraduate standing, Graduate standing or PBS status.
Politics of international trade and payments, with special emphasis on international and domestic determinants of protectionism, international and national political institutions, multinational corporations, debt crises, and dilemmas of economic underdevelopment.

PS 540 Seminar In Comparative Politics 3.
Prerequisite: One course in comparative politics and one course in PS methodology.
This seminar opens with a survey of the problems and methods of comparative political analysis, after which students assigned a specific, limited subject to be examined within framework of a systematic, analytical scheme appropriate to topic. Specific topics drawn from subjects of political ideologies, political groups, political elites and decision-making institutions and processes.

PS 541 Political Islam 3.
Prerequisite: Graduate standing.
Explores the diversity of movements, organizations, and political parties that fall within political Islam, from the extremist, violent fringe to democratically functioning groups. Begins with an overview of the interaction of religion and politics before defining political Islam and exploring major groups practicing it. The course provides a comparative perspective on Islam's interactions with the political realm, as well as a study of the role it plays in promoting or hindering democratic development.

PS 542 European Politics 3.
Prerequisite: Nine hours of PS program, Graduate standing or PBS status.
Analysis of political institutions and processes in selected European states and the European community and major social, economic and political issues confronting European societies.

PS 543 Latin American nd Caribbean Politics 3.
Prerequisite: Advanced Undergraduate standing including 12 hours of Political Science or PBS status.
Comparative political development in Latin America and the Caribbean. Emphasis on democratization and implications for US foreign policy.

PS 545 Comparative Systems Of Law and Justice 3.
Prerequisite: Graduate standing.
Legal culture and administration of justice in various countries and in the U.S. Emphasis on impact of legal ideology on nature of crime, political justice, police administration, corrections and judicial processes. Credit for both PS 445 and PS 545 is not allowed.

PS 571 Research Methods and Analysis 3.
Prerequisite: Advanced Undergraduate standing including 12 hours of PS program, Graduate standing or PBS status.
A survey of methods used in behavioral research as applied to field of political science: elements of empirical theory, research design, measurement of variables, sampling procedures, data courses, techniques of data collection, statistical analysis, qualitative methodologies and presentation of research findings.

PS 585 Constitutional and Legal Principles for Police Supervisors 3.
Intensive look at the constitutional underpinnings and restrictions on laws and government agency policies impacting police agencies. Specific constitutional protections relating to interrogation and search of employees, freedom of speech, freedom of religion and drug testing. Legal risks and liabilities facing police managers and how to reduce these risks.

PS 590 Special Topics 1-6.
PS 598 Special Topics In Political Science 1-6.
Prerequisite: Six hours of PS program.
Detailed investigation of a topic. Topic and mode of study determined by student and a faculty member.

PS 610 Special Topics 1-6.
Prerequisite: Six hours of PS program.
Detailed investigation of a topic. Topic and mode of study determined by student and a faculty member.

Polymer and Color Chemistry (PCC)
PCC - Polymer and Color Chemistry Courses

PCC 101 Introduction to Polymer and Color Chemistry 2. Corequisite: PCC 104. Introduction of topics related to Polymer and Color Chemistry, e.g. fiber and fiber forming polymers, polymerization methods, into to color assessment methods, various chemistry disciplines, molecular interactions, periodic table, acids, bases, solutions, into to and examples of textile coloration and textile finishing techniques.

PCC 104 Introduction to Polymer and Color Chemistry Lab 1. Corequisite: PCC 101. An introduction to hands-on laboratory work for the study of basic polymer principles, dye synthesis, forensic analysis and coloration of fibers.

PCC 106 Polymer Chemistry and Environmental Sustainability 3. Prerequisite: CH 101 or CH 103; Corequisite: CH 221 or CH 225. Polymers are prevalent in almost every part of our lives. Many polymers are petroleum based and their raw material supply is limited. Using a theme of environmental impact, this course will review the origin and preparation of key industrial raw materials and how they are used in polymer synthesis. Properties of synthetic polymers will be introduced and concepts for establishing sustainable polymers will be discussed.

PCC 203 Introduction to Polymer Chemistry 3. Prerequisite: CH 101 and (MT 105 or TT 105 or PCC 101). Organic reaction principles necessary to understand the preparation, properties and chemistry of polymers. Synthesis, applications and behavior of common classes of polymers with emphasis on those materials used in the textile industry. The chemistry and structure of natural and man-made fibers.

PCC 274 Introduction to Forensic Science 3. The field of forensic science is the application of science to the law. The primary purpose of this course is to introduce students to the 'real world' of forensics. It will serve as a basis for more advanced forensic courses. Solving crimes are often complex and costly affairs, involving myriad science and engineering disciplines, ethics, legal issues, and strong communication skills. These key areas will be introduced via regular course lectures, guest lectures from faculty members within NC State and other institutions, and guest lectures from current or former field agents and professional forensic scientists.

PCC 301 Technology of Dyeing and Finishing 3. Prerequisite: PCC 106 or PCC 203 or TE 200 and Corequisite: PCC 304. Basic principles and procedures for the preparation, dyeing, printing, and finishing of natural and man-made fibers. The chemical nature of dyes and fastness properties and the chemical nature of finishes used to impart specific end-use properties.

PCC 302 Technology of Textile Wet Processing 4. Prerequisite: (TT 105 or MT 105 or PCC 101) and TMS 211 and CH 101 and (PY 211 or PY 205). Introduction to the science and technology used in textile wet processing. Topics include preparation, dyeing, printing and finishing of textiles, basics of color generation and measurement. Emphasis mainly on cotton, wool, nylon and polyester. Laboratory includes experiments in wet processing and a project on statistical analysis of fabric defects.

PCC 304 Technology of Dyeing & Finishing Laboratory 1. Prerequisite: PCC 106 or PCC 203 or TE 200 and Corequisite: PCC 301. Laboratory experience involving the preparation, dyeing, printing, and finishing of natural and man-made fibers.

PCC 350 Introduction to Color Science and Its Applications 2. Prerequisite: PCC 301 and either PY 208 or PY 212; Corequisite: PCC 354. Basic principles and applications of color science. Physical, physiological and psychophysical aspects of color, color perception, color specification, color measurement and color control.

PCC 354 Intro to Color Science Laboratory 1. Prerequisite: PCC 301 and either PY 208 or PY 212; Corequisite: PCC 350. An introduction to hands-on laboratory work for the color measurement and perception of colored materials.

PCC 401 Impact of Industry on the Environment and Society 3. Prerequisite: Junior standing. Relationship of society to safety and environmental aspects of manufactured products. Quantifying manufacturing risks. Protective methods, e.g. administrative, engineering, personal, treatment, pollution prevention. Social factors, e.g. political, regulatory, legal, consumer attitudes, public policy, perceptions. Understanding complex social issues, especially situations with conflicting goals. Critical comparison of options for risk reduction, and selecting reasonable (hopefully optimal) courses of action in complex and uncertain situations. Unsolved problems of industry and society (e.g. greenhouse effect). Relationships of ethics, laws and regulations to manufacturing.

PCC 402 Introduction to the Theory and Practice of Fiber Formation 3. Prerequisite: TE 200 and (CH 201 or CH 203) and (PY 208 or PY 212) and (MA 231 or MA 241). Flow behavior of polymeric materials as related to the formation of fibers by melt, dry and wet extrusion. Elementary theories of drawing and heat setting. Application of fiber-forming theories to synthetic and cellulosic fibers. Offered in Fall only.

PCC 412 Textile Chemical Analysis 2. Prerequisite: PCC 301 and (CH 331 or CH 433 or TE 303); Corequisite: PCC 414. Application of analytical techniques for analysis to fibers, textile chemicals and textile processes; atomic absorption, ultraviolet, visible, near-infrared and infrared spectrophotometry; chromatography; interfacial tension; calorimetric, gravimetric and complexometric analyses. Emphasis on interpretation of data and solving problems of analysis for quantitave and characterization purposes.

PCC 414 Textile Chemistry Analysis Lab 1. Prerequisite: PCC 301 and (CH 331 or CH 433 or TE 303); Corequisite: PCC 412. Laboratory course in the application of analytical techniques for analysis of fibers, textile chemicals and textile processes; atomic absorption, ultraviolet, visible, near-infrared and infrared spectrophotometry; chromatography; interfacial tension; calorimetric, gravimetric and complexometric analyses. Emphasis on interpretation of data solving problems of analysis for quantitave and characterization purposes.

PCC 420 Textile Dyeing and Printing 3. Prerequisite: PCC 301. Topics in coloration of textile fibers; chemical and physical mechanisms in textile dyeing and printing.
Introduction to natural and synthetic biopolymers used for biomedical engineering. Polymer concepts of polymerization and applications. Goals and challenges of biomaterials selection for development of the materials of tomorrow. This laboratory course is intended for PCC majors. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

**PCC 474 Forensic Chemistry Laboratory** 3.  
Prerequisite: (CH 220 or CH 223 or CH 227) and TMS 211.  
Forensic chemistry is the application of chemistry to the law. It is a key part of crime scene investigations. In this course, students work in teams and discover standard methods of crime scene processing, latent evidence processing and analysis of materials and chemicals germane to forensic trace evidence. Advanced analytical chemistry techniques will be learned and applied to solve a ‘crime’ with suspects. Students will attempt to solve the crime and will present their analytical evidence in a courtroom setting with cross-examination.

**PCC 490 Undergraduate Research in Polymer and Color Chemistry** 1-6.  
Prerequisite: PCC 301 and PCC 461/CH 461 and (TE 303 or CH 331 or CH 433).  
Faculty-supervised individual research for undergraduates in PCC. Students must find an advisor from within the department with whom to work on a regular basis. Intended for PCC majors. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

**PCC 491 Seminar in Polymer and Color Chemistry** 1.  
Prerequisite: Senior standing.  
Familiarizes student with the principal sources of polymer and color chemistry literature and emphasizes importance of keeping abreast of developments in the field. Emphasizes fundamentals of technical writing. Arranged. Intended for PCC majors.

**PCC 492 Special Topics in Polymer and Color Chemistry** 3.  
Presentation of material not normally available in regular course offerings or offering of new courses on a trial basis. Credits and content determined by faculty member in consultation with the Department Head.

**Poultry Science (PO)**

**PO - Poultry Science Courses**

**PO 111 Poultry Production** 3.  
Introduction to poultry science and production. Domestication of key poultry species, embryology and hatchery management, anatomy and physiology, poultry rations, housing refinements, and diseases relative to the production of poultry meats and eggs. STAFF.

**PO 150 Poultry Management** 3.  
Principles and practices of commercial market turkey, broiler, and roaster management. Includes breeding, nutrition, housing, related production parameters, and an examination of contracts and grower-company relationships.

**PO 162 Livestock and Poultry Disease Management** 3.  
Basic principles of disease and disease management in livestock and poultry. Disease prevention through sanitation and vaccination. Diseases of horses, pigs, ruminants, poultry, and disease prevention programs for each species.

**PO 201 Poultry Science and Production** 3.  
Fundamental principles of broiler, turkey and egg production including poultry physiology, breeding, incubation, housing, nutrition, disease control, management and marketing.

**PO 201A Poultry Science and Production** 3.  
Fundamental principles of broiler, turkey and egg production including poultry physiology, breeding, incubation, housing, nutrition, disease control, management and marketing.
PO 202 Poultry Science and Production Laboratory 1
Corequisite: PO 201.
This laboratory course will cover the fundamental principles of broiler, turkey and egg production including poultry physiology, housing, growth and productivity via exploitation of environmental influences on physiological systems. Credit not given for PO 404 and 504.

PO 202A Poultry Science and Production Laboratory 1
Corequisite: PO 201.
This laboratory course will cover the fundamental principles of broiler, turkey and egg production including poultry physiology, housing, nutrition, disease control, management and marketing. This course includes field trips for which transportation will be provided.

PO 212 Poultry and People: Why did the chicken cross the world? 3
Poultry species play a vital role in modern society. This course engages students to develop research skills including information literacy, data collection, and developing arguments based on evidence. Specific course topics are developed by students during each course offering. General course content will include, but is not limited by the following topics: History of Domestication, Religious Symbolism, Social and Culinary Practice, and Modern Poultry Production (post-1950) commercial and hobby. Delivery of this course will be inquiry based and focus on utilizing research techniques to gather information, develop a hypothesis, collect information, interpret the results, and report findings in multiple formats.

PO 290 Poultry Seminar 1
Prerequisite: Sophomore standing.
Exploration of topics related with current and future potential to influence the poultry industry. Guest lectures from industry representatives will include: vertically integrated poultry production, primary breeders, marketing, animal health, veterinary medicine as it relates to poultry, allied equipment manufacturers, and management of poultry companies. Special emphasis on summer internships and career services.

PO 322 Muscle Foods and Eggs 3
Prerequisite: ZO 160, BIO 181 or BIO 183.
Processing and preserving fresh poultry, red meats, seafood, and eggs. Autopsy and post-mortem events as they affect quality, yield, and compositional characteristics of muscle foods. Principles and procedures involved in the production of processed meat items.

PO 340 Live Poultry and Poultry Product Evaluation, Grading, and Inspection 3
Prerequisite: PO 201.
To provide students with experience handling live poultry as well as working with an animal handling USDA grades and evaluation of poultry meat, meat products, and eggs. Develop an understanding of product specifications.

PO 350 Introduction to HACCP 3
Introductory course on the Hazard Analysis and Critical Control Points System (HACCP) which is designed to decrease hazards in foods. An International HACCP Alliance approved curriculum which covers prerequisite programs. A step by step approach for developing and implementing a HACCP plan for USDA regulated food processing plants. Offered only as a world wide web course through the Office of Instructional Telecommunications.

PO 404 Avian Anatomy and Physiology 4
Prerequisite: PO 201.
Principles of avian physiology integrating physiological functions and anatomical structures of organs and organ systems. Practical problems associated with poultry production. The importance of maximizing growth and productivity via exploitation of environmental influences on physiological systems. Credit not given for PO 404 and 504.

PO 406 Physiological Aspects of Poultry Management 3
Prerequisite: PO 201, Corequisite: PO 407.
Application of physiological principles to modern poultry management and research. Poultry physiology will be related to practical and research management topics including nutrition, housing, ventilation, disease, heat stress, and lighting programs. Students cannot receive credit for both PO 406 and PO 506.

PO 407 Physiological Aspects of Poultry Management Laboratory 1
Prerequisite: PO 201, Corequisite: PO 406.
Practical experience with poultry husbandry, animal environment management, and feeding in a research environment Laboratory exercises include feeding and nutrition programs, weighing birds, lighting management and infrastructure, biosecurity and sanitation, vaccinations, hatching egg management, brooding, ventilation programs and infrastructure, housing design and infrastructure, SOP development, human safety and health training, and animal care training. Laboratory exercises will prepare students for both commercial poultry industry and animal research management careers. Co-requisite with PO 406. Personal transportation to Chicken Educational Unit required.

PO 410 Production and Management of Game Birds in Confinement 3.
Management principles associated with the successful propagation and rearing of game birds, ornamental birds and waterfowl in confinement. Housing and pen requirements, nutrition, disease control and regulatory issues included.

PO 411 Agrosecurity 3
Junior standing or above.
This course is designed to increase the awareness of the issues and vulnerabilities of the US agricultural system, the importance of agriculture in the US economy, and the importance of protecting it from disease and/or attack. This course is designed to increase the awareness of the issues and vulnerabilities of the US agricultural system, the importance of agriculture in the US economy, and the importance of protecting it from disease and/or attack. This course is designed to increase the awareness of the issues and vulnerabilities of the US agricultural system, the importance of agriculture in the US economy, and the importance of protecting it from disease and/or attack. This course is designed to increase the awareness of the issues and vulnerabilities of the US agricultural system, the importance of agriculture in the US economy, and the importance of protecting it from disease and/or attack. This course is designed to increase the awareness of the issues and vulnerabilities of the US agricultural system, the importance of agriculture in the US economy, and the importance of protecting it from disease and/or attack. This course is designed to increase the awareness of the issues and vulnerabilities of the US agricultural system, the importance of agriculture in the US economy, and the importance of protecting it from disease and/or attack.
PO 415 Comparative Nutrition 3.
Prerequisite: ANS 225 or ANS 230 or CH 220 or CH 223 or CH 227.
Principles of nutrition, including the classification of nutrients and the nutrient requirements of and metabolism by different species for health, growth, maintenance and productive functions.

PO 421 Commercial Egg Production 2.
Prerequisite: PO 201.
Principles and current practices of commercial egg production.

PO 424 Poultry Meat Production 3.
Prerequisite: PO 201.
Principles and current practices of vertically integrated broiler and turkey production; encompassing management, nutrition, poultry health, environmental, and related areas.

PO 425 Feed Manufacturing Technology 3.
Feed mill management, feed ingredient purchasing, inventory, storage, and quality evaluation, computerized feed formulation, feeding programs for poultry and swine, feed mill design, equipment, maintenance, operation, safety, state and federal regulations pertaining to feed manufacture.

PO 433 Poultry Processing and Products 3.
Prerequisite: PO 201.
Poultry processing, further processing, and resulting products as affected by basic muscle composition and function during the conversion of muscle to meat. Microbiology of spoilage and pathogenic organisms, and the regulatory and HACCP programs designed to minimize problems. Overall business functions of poultry processing to understand profit/loss factors, and skills necessary for communication and management. Various sections on sanitary design/construction, pest control, wastewater treatment, and further processed egg products. Credit for both PO 533 and PO 433 is not allowed. Transportation to field trips will be provided. Non-scheduled class time for field trips or out-of-class activities may be required for this class. Transportation to scheduled labs at Lake Wheeler CEU/Poultry Processing Lab will be provided by students.

PO 435 Poultry Incubation & Breeding 4.
Prerequisite: PO 201.
Principles and current practices of modern poultry incubation and breeding production systems. Students will be able to describe basic elements of breeding management and production practices, to apply those elements to specific scenarios, and to strengthen their ability to interpret and make critical judgements relative to the breeding of poultry, production of hatching eggs, and the subsequent incubation and hatching process.

PO 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

PO 493 Special Problems in Poultry Science 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

PO 495 Special Topics in Poultry Science 1-3.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

PO 504 Avian Anatomy and Physiology 4.
Prerequisite: PO 201.
Principles of avian physiology integrating physiological functions and anatomical structures of organs and organ systems. Practical problems associated with poultry production. The importance of maximizing growth and productivity via exploitation of environmental influences on physiological systems. Credit not given for PO 404 and 504.

PO 506 Physiological Aspects of Poultry Management 3.
Prerequisite: PO 201.
Application of physiological principles to modern poultry management and research. Poultry physiology will be related to practical and research management topics including nutrition, housing, ventilation, disease, heat stress, and lighting programs. Students cannot receive credit for both PO 406 and PO 506.

PO 510 Poultry Product Safety: An On-Farm Model 3.

PO 515 Advanced Comparative Nutrition 3.
An in-depth presentation of core nutrition principles stressing the role nutrient availability plays in digestive and metabolic adaptations of a variety of animal species. Consideration will be given to translational biomedical nutrition issues that apply to both human and animal health. Students are expected to develop a term paper suitable for submission in a peer-reviewed scientific journal that reviews the latest information in metabolic or digestive adaptations of a specific species as related to nutritional processes. Credit will not be allowed for both ANS/NTR/PO 415 comparative Nutrition and NTR/PO 515 Advanced Comparative Nutrition.

PO 524 Comparative Endocrinology 3.
Prerequisite: BIO 421 or PO 405.
Basic concepts of endocrinology, including functions of major endocrine glands involved in processes of growth, metabolism and reproduction.

PO 533 Poultry Processing and Products 3.
Prerequisite: PO 201.
Poultry processing, further processing, and resulting products as affected by basic muscle composition and function during the conversion of muscle to meat. Microbiology of spoilage and pathogenic organisms, and the regulatory and HACCP programs designed to minimize problems. Overall business functions of poultry processing to understand profit/loss factors, and skills necessary for communication and management. Various sections on sanitary design/construction, pest control, wastewater treatment, and further processed egg products. Credit for both PO 533 and PO 433 is not allowed. Transportation to field trips will be provided. Non-scheduled class time for field trips or out-of-class activities may be required for this class. Transportation to scheduled labs at Lake Wheeler CEU/Poultry Processing Lab will be provided by students.

PO 534 Animal Cell Culture Techniques 2.
Prerequisite: BIT 360 or BIT 810 equivalent.
Introduction to animal cell culture techniques. Aseptic technique for vertebrate cell culture, media formulation, primary cell culture, long-term maintenance of cell lines, application of molecular techniques to in vitro situations. Half semester course, second part.
PO 580 Feed and Ingredient Quality Assurance 3.
Prerequisite: NTR(FM) 525.
The course will teach students the principles of feed and ingredient quality assurance and how to develop a comprehensive quality assurance program. The course will include the development of an approved supplier list, ingredient specifications, feed manufacturing quality assurance procedures, and risk based feed safety programs.

PO 590 Special Problems in Poultry Science 1-6.

PO 601 Seminar 1.
Preparation for research, research perspectives, rising concerns in poultry production, orientation for graduate studies in poultry science. Required of all graduate students in the Department of Poultry Science.

PO 620 Special Problems 1-6.
Prerequisite: Graduate standing.
Specific problems of study assigned in various phases of poultry science.

PO 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PO 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

PO 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

PO 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

PO 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

PO 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

PO 757 Comparative Immunology 3.
Prerequisite: MB 751 or MB 441 or BIO 414.
Compare and contrast the immune system structure and function of animal species of agricultural and veterinary significance with that of humans and traditional biomedical model organisms. Discuss key evolutionary differences, how different species use different mechanisms to achieve the same outcomes, and the clinical implications for these differences.

PO 775 Mineral Metabolism 3.
Prerequisite: ANS(NTR,PO) 415, BCH 451 and ZO 421.
Requirements, function, distribution, absorption, excretion and toxicity of minerals in humans and domestic animals. Interactions between minerals and other factors affecting mineral metabolism or availability. Emphasis on mechanisms associated with mineral functions and the metabolic bases for the development of signs of deficiency.

PO 801 Graduate Seminar In Poultry Science 1.
Preparation for research, research perspectives, rising concerns in poultry production, orientation for graduate studies in poultry science. Required of all graduate students in the Department of Poultry Science.

PO 820 Special Problems In Poultry Science 1-6.
Prerequisite: Graduate standing.
Specific problems of study assigned in various phases of poultry science.

PO 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

PO 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

PO 893 Doctoral Supervised Research 1-9.
Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

PO 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Professional Writing (WRT)
WRT - Professional Writing Courses

WRT 111 Expository Writing 3.
Emphasis on writing process including audience analysis, topic selection, thesis support and development, editing and revision. Upon completion, students should be able to prepare unified, coherent, well-developed essays using standard written English. AGI majors only; C-Wall course; prerequisite for WRT 114, professional Writing, Research and Reporting.

WRT 114 Professional Writing, Research and Reporting 3.
Prerequisite: WRT 111.
Emphasis placed on research, listening, critical thinking, analysis, interpretation and design used in oral and written presentations. Upon completion, students should be able to work individually and collaboratively to produce well-designed and professionally written and oral presentations. Restricted to AGI majors; C-Wall course.

Psychology (PSY)

PSY - Psychology Courses

PSY 200 Introduction to Psychology 3.
Survey of basic principles for the understanding of behavior and experience including development, learning, cognition, biological foundations, perception, motivation, personality, behavior abnormalities, measurement of individual differences, and social processes. The value of scientific observation and experimentation to the development of psychological understanding is emphasized.

PSY 230 Introduction to Psychological Research 3.
Prerequisite: PSY 200.
This course is an introduction to the principles of scientific research. Students will develop and test research hypotheses in accordance with methods approved by the American Psychological Association. Methods of analyzing data and the interpretation of research findings will be stressed. Students will work in teams to collect, analyze, report, and provide a professional presentation of a group research project. Psychology majors and minors must take the course under the graded option.

PSY 240 Introduction to Behavioral Research I 3.
Prerequisite: PSY or HRD Majors, PSY 200, Corequisite: PSY (ST) 241.
Introduction to quantitative methods in psychology, including measurement, experimental control, validity, and fundamentals of research design. Discussion of distributions and statistical inference. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PSY 241 Introduction to Behavioral Research I Lab 1.
Prerequisite: PSY or HRD Majors, PSY 200, Corequisite: PSY (ST) 240.
Students design, analyze and report a variety of simple experiments. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PSY 242 Introduction to Behavioral Research II 3.
Prerequisite: PSY or HRD Majors, PSY (ST) 240, Corequisite: PSY (ST) 243.
Continuation of PSY (ST) 240. Ethics of Research in Psychology. Techniques for the development of research proposals. Statistical techniques for data analysis including non-parametrics, one-way and two-way ANOVA and introduction to correlation and regression. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PSY 243 Introduction to Behavioral Research II Lab 2.
Prerequisite: PSY or HRD Majors, PSY (ST) 240, Corequisite: PSY (ST) 242.
Design and analysis of a major research project. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

PSY 307 Industrial and Organizational Psychology 3.
Prerequisite: PSY 200 or PSY 201.
Surveys the application of psychological theories and methods to problems involving people in working settings. Topics include: organizational and management theory; work motivation and job satisfaction; job and organizational analysis; performance evaluation; personnel recruitment, selection, and placement; and personnel training and development.

PSY 311 Social Psychology 3.
Prerequisite: PSY 200 or PSY 201.
Theory and research on how individuals respond and are responded to in social situations. Topics include attitude formation and change, affiliation, attraction, self and interpersonal perception, interpersonal relationships, aggression, helping behavior, intergroup behavior, and group dynamics.

PSY 312 Applied Psychology 3.
Prerequisite: PSY 200 or PSY 201.
Covers diverse areas of psychological practice, related methods and ethical issues. Includes illustrative cases of psychological practice in health, education, work settings, law, sports, consumer markets, and cross-cultural settings. Explores professional roles and contributions in the contexts of social, organizational and technological change.

PSY 313 Positive Psychology 3.
Prerequisite: PSY 200.
Positive psychology is the scientific study of positive experience, positive individual traits, and the institutions and practices that facilitate their development. This course reviews the history of positive psychology and the contributions this new field has made to several traditional research areas in psychology. Among other issues, the course will address the questions such as: What is happiness and how should we measure it? What determines subjective well-being? Can (and should) we deliberately increase happiness? (Restricted to psychology majors).

PSY 340 Ergonomics 3.
Prerequisite: PSY 200 or PSY 201.
Concepts from ergonomics, environmental psychology, and cognitive psychology related through design examples to problems of everyday living. Criteria of efficiency, comfort and safety evaluated relative to the design of activity, products, and the environment. Topics include: visual and auditory perception, information processing, physical activity, noise and lighting, work space design, workload, and product design.
PSY 345 Psychology and the African American Experience 3.
Prerequisite: PSY 200 or PSY 201.
Historical and cultural examination of the psychological experiences of African American experience from pre-American times to the present. Focus on mental health, personality, identity development, racism, oppression, psychological empowerment and African-centered world view. Discussion of contemporary issues within the African American community.

PSY 360 Community Psychology Principles and Practice 3.
Prerequisite: PSY 200.
This course provides an introduction to the field of community psychology. The aim of this course is to help empower students to contribute to effective social change in their communities. Community psychology focuses upon person-environment interactions and the ways individuals navigate between different social contexts (e.g., schools, neighborhood, community, and society). Community psychologists employ a variety of methodological approaches to understand the social issues facing communities today such as juvenile violence, homelessness, HIV-AIDS, and domestic violence.

PSY 370 Personality 3.
Prerequisite: PSY 200.
Major personality theories. Definition of personality associated with each theory as well as the assumptions and principles used in accounting for human behavior. Theories evaluated considering recent research.

PSY 375 Developmental Psychology 3.
Prerequisite: PSY 200 or EDP 304.
Behavioral development during the life span, including study of current theories and project work with persons at various stages of the life cycle.

PSY 400 Perception 3.
Prerequisite: PSY 200 or PSY 201, Junior/Senior.
Anatomy and physiology of the major sensory systems, their relationship to central structures of the brain, important and/or common pathological conditions. Basic issues and techniques of psychophysiology. Perceptual phenomena and theory, with an emphasis on topics in two- and three-dimensional spatial perception, including the perceptions of size, depth and motion. Consideration of perceptual phenomena in practical settings.

PSY 406 Psychology of Gender 3.
Prerequisite: PSY 200, PSY 201 or HSS 200.
Current theory and research on perceived and actual biological, social, cognitive, personality and emotional similarities and differences of men and women throughout the lifespan. The construction and consequences of gender in our society and others. Credit cannot be given for both PSY 406 and PSY 506.

PSY 410 Learning and Motivation 3.
Prerequisite: PSY 200, Junior standing.
Introduction to the primary laboratory research areas in learning and motivation: classical conditioning, operant conditioning, verbal learning, drive theory, and the role of motives. Emphasis upon research on conditioning and its motivational processes as the foundations for techniques in behavior modification. Examination of both the uses and limitations of current information on learning and motivation.

PSY 411 The Psychology of Interdependence and Race 3.
Prerequisite: PSY 311.
The Psychology of Interdependence and Race is designed to explore how interpersonal relationships are structured and how two-person interactions within those structures are influenced by race. Drawing on the major social psychological theory of interpersonal relationships - Interdependence Theory - this course will provide students with an understanding of the various structures of interpersonal relationships in order to explore how and why the presence of race (and other diversity categories) influence the ways in which people try to interact with each other within those interpersonal structures.

PSY 416 Psychology of Emotion 3.
Prerequisite: PSY 200.
Introduction to the classic and contemporary theories of emotion, with strong emphasis on how data provide evidence to test theory. Biological, cognitive, social, and cultural foundations are explored.

PSY 420 Cognitive Processes 3.
Prerequisite: PSY 200, Junior standing.
Introduction to research and theory in cognition, including such topics as memory, acquisition and use of language, reading, problem-solving, reasoning, and concepts.

PSY 425 Introduction to Cognitive Science 3.
Prerequisite: One upper-level course in either PHI, PSY, CSC or Linguistics. Credit is not allowed for both PSY 425 and PHI/PSY 525.
Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. Topics include: the computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI/PSY 425 and PHI/PSY 525.

PSY 430 Biological Psychology 3.
Prerequisite: PSY 200 and (BIO 105/106 or BIO 181).
Biological mechanisms of behavior, including elementary neuroanatomy and neurophysiology, sensory and motor processes, and their application to motivation, learning, and psychological processes.

PSY 431 Health Psychology 3.
Prerequisite: PSY 200 and (PSY 230 or PSY 240/242 OR equivalent research methods course).
Introduction to health psychology. This course provides an overview of the field of health psychology, which is concerned with how behavior and psychological states influence physical health (i.e., how people stay healthy, why people become ill, and how people respond to illness). Application of psychological theory and research methods to such topics as: pain, stress and coping, helplessness and control, reactivity to stress, the effectiveness of behavioral interventions in health, illness prevention, health maintenance, recovery from injury and chronic pain, adjustment to chronic illness, treatment compliance.

PSY 436 Introduction to Psychological Measurement 3.
Prerequisite: PSY 240-241.
The basic principles of psychological measurement, including elementary statistical concepts, reliability, and validity. Emphasizes measurement in the science of psychology. Application of measurement principles to a wide variety of measurement problems.

PSY 470 Abnormal Psychology 3.
Prerequisite: PSY 200 or 304 or EDP 304.
PSY 475 Child Psychology 3.
Prerequisite: PSY 200 or 304 or EDP 304; PSY 376.
Theories, methods, and phenomena of child psychology and application of this information to the enhancement of child development. Multiple aspects of development, including physical, cognitive/intellectual, and social/emotional development, from conception to adolescence. Emphasis on recent research findings in developmental psychology.

PSY 476 Psychology of Adolescent Development 3.
Prerequisite: PSY 200 or EDP 304.
Theories, principles, and issues of human psychological development emphasizing adolescence. Cognitive, social, and physical changes; their interaction. Implications for teaching and parenting adolescents.

PSY 491 Special Topics in Psychology 3.
Prerequisite: PSY 200.
Exploration in depth of advanced areas and topics of current interest in psychology.

PSY 495 Community-Based Applied Psychology 4.
Prerequisite: PSY 200 and PSY 230.
Service learning course that covers one or more areas of psychological practice, including relevant research methods, community engagement principles and practices, and ethical issues. Includes learning about psychological practice in at least one of the following settings: health, education, work settings, law, sports, community-based setting, consumer markets, and/or cross-cultural settings. Explores professional roles and contributions in the contexts of social, education, organizational and/or technological change. $15 liability insurance fee required.

PSY 498 Psychology Honors Seminar 3.
Prerequisite: HRD and PSY honors students.
Seminar and independent study under faculty direction. Provides the undergraduate psychology honors students with an opportunity to practice skills in designing, conducting, and evaluating research. The student, working closely with a faculty advisor, designs a research approach to a particular body of literature, accumulates appropriate data, and analyzes and evaluates the data. Must take two semesters.

PSY 499 Individual Study in Psychology 1-6.
Corequisite: PSY 495 for HRD majors during their work semester.
Individual research project (literature review, experiment, survey, field study) open to any undergraduate, under the direction of a Psychology Department faculty member.

PSY 500 Visual Perception 3.
Prerequisite: Graduate standing.
Detailed consideration of anatomy and physiology of visual system (both peripheral and central components). Modern quantitative approaches to psychophysical problems of detection, discrimination, scaling. Examination of chief determinants of visual perception, including both stimulus variables and such organismic variables as learning, motivation and attention. Discussion of perceptual theory and processes emphasizes several topics in two- and three-dimensional spatial perception.

PSY 502 Physiological Psychology 3.
Prerequisite: Twelve hours of PSY including PSY 200, 400, 410.
Physiological foundations of behavior, basic vertebrate neuroanatomy and neurophysiology.

PSY 504 Evolutionary Psychology 3.
Emphasis upon use of evolutionary theory to understand the interaction of genetic and environmental influences on human behavior and thought. Topics include human mating, kinship, parenting, cooperation, aggression, cognition, and morality.

PSY 506 Psychology of Gender 3.
Current theory and research on perceived and actual biological, social, cognitive, personality, and emotional similarities and differences of men and women throughout lifespan. Construction and consequences of gender in our society and others. Credit for both PSY 406 and PSY 506 is not allowed.

PSY 508 Cognitive Processes 3.
Prerequisite: Graduate standing or PBS status.
Emphasis upon the results from research on a number of complex processes (e.g., remembering, concept learning, problem solving, acquisition and use of language) and the theories that have been proposed to explain these results.

PSY 510 Advanced Problems In Psychology 1-3.
Prerequisite: Graduate standing.
Offers opportunities to explore various areas of psychology. Sections: Section D, developmental psychology; Section I, industrial-organizational and vocational psychology; Section S, social psychology.

PSY 511 Advanced Social Psychology 3.
Prerequisite: Graduate standing or PBS status.
A survey of theory and research in social psychology through reading and discussion of primary source materials. In addition, the course deals with issues of methodology, ethical questions in social psychological research and application of research findings to the world at large.

PSY 525 Introduction To Cognitive Science 3.
Prerequisite: Graduate standing. Credit is not allowed for both PSY 525 and PHI/PSY 425.
Philosophical foundations and empirical fundamentals of cognitive science, an interdisciplinary approach to human cognition. The computational model of mind, mental representation, cognitive architecture, the acquisition and use of language. Students cannot receive credit for both PHI/PSY 425 and PHI/PSY 525.

PSY 535 Tests and Measurements 3.
Prerequisite: Six hours of PSY program.
A study of the principles of psychological testing including norms and units of measurement, elementary statistical concepts, reliability and validity. In addition, some attention devoted to the major types of available tests such as general intellectual development, tests of separate abilities, achievement tests, measures of personality and interest inventories.

PSY 540 Human Factors In Systems Design 3.
Prerequisite: IE 452 or PSY 340, Corequisite: ST 507 or 515.
Introduction to problems of the systems development cycle, including human-machine function allocation, military specifications, display-control compatibility, the personnel sub-system concept and maintainability design. Detailed treatment given to people as information processing mechanisms.

PSY 541 Overview of Human Factors Psychology 3.
An overview of Human Factors Psychology covering a large number of tools, topics, and exercises important for the field of human factors. Includes topics fundamental to human factors research, such as attention, decision making, and motor control, as well as specific domains within human factors, such as information technology, healthcare, aging, and transportation, with particular emphasis on the methods used for study of these areas. A group project will give students experience with the usability evaluation process.
PSY 553 Principles and Practice Of Ecological/Community Psychology 3.  
Prerequisite: Six hours PSY program.  
Introduction to community psychology and its attempt to redefine social problems according to an ecological frame-of-reference with emphasis on humanitarian values, cultural diversity, the promotion of a psychological sense of community among individuals and groups, and the need for psychologists to engage in systematic community research and action.

PSY 558 Psychology and the African Experience 3.  
Prerequisite: Six hours PSY program.  
An ethnographic approach to the psychology of peoples of African descent through examination of the influence of historical and cultural phenomena. Specific attention to understanding the Africentric world view and issues of mental health, personality and identity development, racism, oppression and empowerment.

PSY 575 Special Topics in Psychology in the Public Interest 1-6.  
P: 6 credit hours in GRAD PSY.  
Exploration of advanced specialized topics in Psychology in the Public Interest Program, to enhance in-depth graduate training in specific applied theories and methods. Seminar content will rotate, with attention to the development and evaluation of interventions to address important problems in individuals' well-being in society, particularly those faced by underrepresented groups. Graduate standing is required.

PSY 582 Adolescent Development 3.  
Prerequisite: 6 hours in PSY.  
Current theories and research on development during adolescence. Topics include: physical growth, cognitive changes, relationships with peers, parents and teachers, quest for identity and independence, morality and sexuality.

PSY 584 Advanced Developmental Psychology 3.  
Prerequisite: Nine hrs. of PSY, including PSY 376, PSY 475 or PSY 476.  
A survey of the role of growth and development in human behavior, particularly during the child and adolescent periods. This course pays particular attention to basic principles and theories in the area of developmental psychology.

PSY 591 History and Systems Of Psychology 1-3.  
Prerequisite: PSY 200,400,410,420, Consent of Instructor or Graduate standing.  
Aim of this course is to acquaint students with the history of psychology and psychological systems and to give students some practice in taking different approaches to a particular problem area.

PSY 611 Psychological Clinic Practicum 1-12.  
Prerequisite: Twelve hrs. in grad. PSY, which must include clinical skill courses PSY 722 and PSY 723..  
Clinical participation in interviewing, counseling, psycho-therapy and administration of psychological tests. Practicum to be concerned with adults and children.

PSY 651 Internship In Psychology 1-6.  
Prerequisite: Approval of advisory committee.  
Supervised work experience in an appropriate setting with professional supervision in the field from a doctoral level psychologist with credentials and/or experience in the appropriate specialty in psychology. Experience consists of full time for one semester or half time for an academic year or equivalent time.

PSY 680 Directed Study Psychology 1-6.  
Research project for graduate students supervised by members of the graduate faculty. Research to be elected on basis of interest of student and not to be part of thesis or dissertation research. Credits Arranged.

PSY 685 Master's Supervised Teaching 1-3.  
Prerequisite: Master's student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PSY 689 Master's Thesis Preparation 1-9.  
Prerequisite: Master's student.  
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.  
Thesis Research.

PSY 696 Summer Thesis Research 1.  
Prerequisite: Master's student.  
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.  
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged.

PSY 704 Learning and Motivation 3.  
Prerequisite: Graduate standing or PBS status.  
A systematic analysis of some of the major classes of variables determining behavioral change. Learning variables analyzed within their primary experimental setting, and emphasis upon the diversity of the functions governing behavior change rather than upon the development of some comprehensive theory. Examination of both learning and motivational variables as they contribute to changes in performance within the experimental setting.

PSY 705 Affect and Cognition 3.  
Prerequisite: Six Hours of Graduate Level PSY.  
Critical examination of research and theory dealing with the intersection of affect and cognition. Topics will include the impact of emotion, mood and other aspects of affective experience on memory, decision making, judgment, and reasoning. Developmental and individual difference will be explored, as will the neuropsychological underpinnings of observed relationships.

PSY 710 Special Topics In Psychology 1-3.  
Prerequisite: Graduate standing.  
Course provides opportunity for exploration in depth of advanced topical areas which, because of their degree of specialization, are not generally involved in other courses; for example, multivariate methodology in psychology, computer simulation, mathematical model building. Some new 700-level courses will first be offered under this title during developmental phase and as such may involve lectures and/or laboratories.

PSY 714 Social Psychology: Small Groups Research 3.  
Prerequisite: PSY 511.  
Surveys the literature and research pertaining to social psychological processes in and between groups. Course content includes basic principles of group formation, role differentiation, communication, influence, norms, social exchange, equity, cooperation/conflict, decision making and pro-social behavior. Environmental factors affecting group behavior also considered. In conjunction with each substantive topic, suitable methodologies for research considered.
PSY 721 Area Seminar In School Psychology 1-6.
Prerequisite: Graduate standing or PBS status.
The following topics dealt with: (1) the development of school psychology as a professional area, (2) methods of inquiry, (3) scientific and theoretical bases, (4) contemporary issues, (5) ethical questions, (6) relationship to other areas within psychology.

PSY 722 Individual Intelligence Measurement 4.
Prerequisite: PSY 535 and consent of school psychology coordinator.
Theoretical approaches to and individual assessment of intellectual functioning, child development, adaptive behavior, and visual motor functioning. Administration, scoring, and interpretation of current standardized instruments and nonstandardized assessment. Written communication of findings.

PSY 723 Personality Measurement 3.
Prerequisite: PSY 722.
Theory and practicum in individual personality testing of children and adults with emphasis on projective techniques, other personality measures, report writing and case studies.

PSY 724 Psychological Intervention I 3.
Prerequisite: PSY 723.
Designed to examine theories, research, techniques, ethics and professional responsibilities related to approaches to psychological intervention. Types of psychological intervention include behavior modification, milieu approaches, crisis intervention techniques and group process methods, in addition to more intensive relationship approaches. A close integration of experiences, content and supervision emphasized in a variety of professional settings with a wide range of personal problems and age groups.

PSY 725 Psychological Intervention II 3.
Prerequisite: PSY 724.
The primary purpose of this course is to provide students opportunities to acquire information, conceptual frameworks, interpersonal skills and a sense of ethical responsibility, all basic to their further development as practicing psychologists. A major effort in the course made to help the student increase his/her interpersonal skills as a means of promoting the psychological growth and effective-ness of others.

PSY 727 Psychological Consultation 3.
Prerequisite: Nine hrs. grad. PSY or ED.
Introduction to psychological consultation with emphasis on school setting. Presentation of various consultation models and theoretical bases. Development of skills in practice of consultation.

PSY 740 Engineering Psychology of Human-computer Interaction 3.
Prerequisite: IE(PSY) 540 or CSC 554.
Exploration of usability of computer technology. Theory and practice of user-centered design for HCI applications. Course focuses on current usability paradigms and principles, psychology of users, iterative and participatory design processes, system requirements specification, prototyping, user support systems, usability evaluation and engineering, interface design guidelines and standards. Application domains include, universal design, virtual reality, and scientific data visualization.

PSY 743 Ergonomic Performance Assessment 3.
Prerequisite: PSY 200, ST 507 and 508.
Fundamentals of ergonomic performance measurement used to assess the effects of environment and system design on human performance. Treatment of topics such as workload measurement, measurement of complex performance, simulator studies, measurement of change, task taxonomies, criterion task sets and statistical methods of task analysis. Problems of laboratory and field research, measurement of change and generalizability of findings.

PSY 744 Human Performance Modeling 3.
Prerequisite: ST 507 or 515 or equivalent; IE (PSY) 540, CSC 554 or IE (PSY) 744.

PSY 750 Area Seminar In Human Resources Development 1-6.
The following topics dealt with: (1) human resources development as an area of inquiry, (2) methods of inquiry, (3) contemporary issues, (4) ethical questions, (5) relationship to other areas within psychology.

PSY 751 Human Resource Planning 3.
Prerequisite: Graduate standing or PBS status, Corequisite: ST 507.
Review of the literature, methods and research issues in the field of human resource planning and evaluation. Goal-setting, needs assessment, information systems, subjective probability, human resource accounting, decision processes, incentive programs, human productivity and related subjects. Focus on planning and evaluation methods for communities and organizations.

PSY 752 Action Research In Psychology 3.
Prerequisite: ST 511, Corequisite: ST 508.
Action research models in psychology and their relationships to research methods. Research in field settings and implications for ethics and social responsibility, internal and external validity, experimenter and volunteer effects and problems of measurement.

PSY 754 Innovation and Technology 3.
Prerequisite: 3 hrs. grad. ST or research methods.
Social science theory and research on innovation process and consequences of deploying and implementing technologies. Interactions between social and technical systems: R&D management; social/ administrative technology; adoption and dissemination; public policy; computer-mediated communications; implementation; and intended and unintended outcomes for individuals, organizations and society.

PSY 760 Psychometrics 3.
Prerequisite: Six hours of graduate statistics, including linear regression.
Theoretical and statistical approaches to understanding psychological measurement. Topics include detailed coverage of reliability, validity, and factor analysis.

PSY 761 Advanced Psychometrics: Item Response Theory 3.
Prerequisite: PSY 760.
Item Response Theory approaches to advanced test construction and scoring; the investigation of test bias via item response theory methods.

PSY 762 Quasi-Experimental Evaluation Design 3.
Prerequisite: ST 507.
An introduction to quasi-experimental design as applied to HRD program evaluation: (1) Methods of assessing informational needs, (2) recognition of internal and external validity threats, (3) design of quasi-experiments to minimize threats and (4) use of results by program decision makers.

PSY 764 Industrial Psychology 3.
Prerequisite: PSY 535.
Issues in psychology literature surrounding the person, organization, and job. Work analysis and design, recruitment, selection, training, and performance appraisal of employees. Emphasis on scientist-practitioner model throughout the course. Graduate standing or PBS status.
PSY 766 Personnel Selection Research 3.  
Prerequisite: Six hrs. of grad. ST, PSY 760.  
A survey of theoretical, methodological and research literature on personnel selection. Topics include organization, task and person analyses, validation strategies, utility and equal opportunity issues and selection strategies. Emphasis on research.

PSY 767 Training Research 3.  
Prerequisite: Six hrs. of grad. PSY and six hrs. of grad. ST.  
A survey of conceptual and research literature on training. Topics include needs assessments, learning, transfer, maintenance, criterion and evaluation issues, as well as a review of research on specific training techniques. Emphasis on research methods and findings, not skill development in specific training techniques.

PSY 768 Organizational Psychology I 3.  
P: ST 511 and 512.  
A survey of the application of behavioral science, particularly psychology and social psychology literature and research to organizational and management problems. Topics include work motivation and attitudes, job design, employee organizational commitment and work engagement.

PSY 769 Work Motivation 3.  
Prerequisite: PSY 768.  
Theory and research in work motivation. An in-depth examination of motivation theory as it pertains to the study of individual behavior in work settings.

PSY 770 Organization Development and Change 3.  
Prerequisite: PSY 768.  
A survey of theory and research in organization development. Attention directed to: (1) methods of diagnosing need for organizational change, (2) techniques currently used to implement and evaluate organizational change, (3) professional ethics and other issues dealing with client-consultant relationship. Emphasis on developmental approaches originating from psychology and allied fields.

PSY 771 Organizational Psychology II 3.  
A survey of the applications of behavioral science, particularly psychology and social psychology literature and research to organizational and management problems. Topics will pertain to the role of leadership in individual, team, and organizational performance.

PSY 775 Methodological Issues In Developmental Psychology 3.  
Prerequisite: PSY 584 and 3 hrs. of grad. statistics.  
Methodological issues, research designs and statistical techniques in developmental psychology. Role and meaning of age as a research variable. Interpretation of research reports. Ethical issues.

PSY 781 Cognitive Development 1-6.  
Prerequisite: PSY 584.  
Examination of research and theory in cognitive development. Primary focus on childhood, but implications for the entire life span addressed. Application of cognitive developmental principles in creating interventions and educational programs also discussed.

PSY 787 Social Development 3.  
R: Psychology Graduate Status or Permission of Instructor.  
Survey of current theory and research on the development of social behavior systems, including attachment, aggression, gender-role behavior, prosocial behavior. Attention to the role of social class, race and culture, and to contemporary phenomena such as day care, single-parent and dual-career families, child abuse.

PSY 788 Adulthood and Aging: Cognitive and Intellectual Change 3.  
Prerequisite: PSY 584 or PSY 508.  
Critical examination of theory and research associated with the study of cognitive and intellectual change in adulthood and aging. Memory and learning, information processing, language, intelligence, social cognition and expertise.

PSY 789 Socio-Emotional Processes In Adulthood and Aging 3.  
Prerequisite: PSY 584.  
Current theory and research on social, emotional and personality development during adulthood and aging. Generally including self-concept and identity, interpersonal relations (friendship, marriage, parenting, work), control, coping and life satisfaction. Attention to gender, culture and contemporary issues in adult development and aging.

PSY 792 Psychology Of Families and Parenting 3.  
Prerequisite: Nine hrs. grad. PSY or ED.  
Special topics in the area, including family influences on cognitive development, effects of parental divorce on children, single-parenting, step-families, child abuse and ethnic/cultural differences in family functioning. A critical examination of traditional and contemporary parenting approaches and an introduction to family therapy.

PSY 793 Stress and Coping 3.  
Prerequisite: Two grad. PSY courses.  
Discussion of current research findings and theories in area of psycho-social stress. Topics include: biology of the stress response, methodology, physical, behavioral and psychological reactions to stress, and relationships between personality and social support to the development of stress-related disorders.

PSY 809 Psychology Colloquium 1-6.  
PSY 820 Special Topics In Psychology 1-6.  
Prerequisite: 6 hrs. of PSY, Corequisite: 3 hrs. of ST.  
Course provides opportunity for exploration in depth of advanced areas and topics of current interest.

PSY 841 School Psychology Practicum 1-6.  
Prerequisite: Twelve hrs. in grad. PSY, which must include clinical skill courses PSY 722 and PSY 723.  
Clinical participation in interviewing, counseling, psycho-therapy and administration of psychological tests. Practicum to be concerned with adults and children.

PSY 846 Practicum in Industrial/Organizational Psychology 3.  
Prerequisite: PSY 764.  
Procedures and techniques used by Industrial and Organizational Psychologists in the field. Students write work proposals, conduct interventions in field, and codument results. Review one or more I/O procedure step-by-step.

PSY 851 Internship In Psychology 1-6.  
Prerequisite: Master's degree in PSY and approval of advisory committee.  
Supervised work experience in an appropriate setting with professional supervision in the field from a doctoral level psychologist with credentials and/or experience in the appropriate specialty in psychology. Experience consists of full time for one semester or half time for an academic year or equivalent time.

PSY 880 Directed Study In Psychology 1-6.  
Research project for graduate students supervised by members of the graduate faculty. Research to be elected on basis of interest of student and not to be part of thesis or dissertation research. Credits Arranged.
Public Administration (PA)

PA - Public Administration Courses

PA 311 Public Policy Analysis and Evaluation 3.
This course will be an introduction to the study of policy analysis, i.e., the systematic study of political-issue problems and alternative policy choices. An individual semester-long project will be completed by each student that identifies a policy issue of interest to the student and various alternatives to implement or improve the policy. Students will measure outcomes of their alternative choices and choose a course of action based on anticipated outcomes.

PA 332 Human Resource Management in Public Sector 3.
PA 332 is a fundamental, comprehensive course designed to provide a view of the major influence human resources management has in a productive public sector organization. Specifically, it examines the challenges of managing complex work systems in the political and institutional environments. Emphasis is given to the challenges facing the public sector in attracting and developing human assets in an environment of conflicting goals, stakeholder obligations and a highly aware electorate. With theoretical concepts established, the focus will shift to practical implementation tools to include recruitment, retention, compensation, and evaluation techniques.

PA 410 Public Administration for Police Supervisors 3.
Introduces law enforcement supervisors to the subject of Public Administration as a field of intellectual inquiry and as a field of professional activity. Students will learn how important founding principles such as federalism, separation of powers, equity, and democratic accountability impact police organizations today. The more practical concerns of police administrators including budgeting and financial management, labor-management relations, and personnel law are also considered. Available only to distance education students enrolled in the AOMP.

PA 411 Managing Police Organizational Behavior 3.
This course is designed to prepare police managers to develop more efficient and effective organizations. Particular attention is given to improving leadership and interpersonal communication skills through self assessment. Students will also study group dynamics, team building, and the importance of employee empowerment within a law enforcement context. Problem solving tools and assessments utilized by police agencies to facilitate organizational change are also considered. Available only to distance education students enrolled in the AOMP.

The purpose of this course is to introduce law enforcement supervisors to management skills that can enhance their individual and organizational effectiveness. Students will learn collaborative leadership, conflict resolution, staff development, group problem solving, delegation and coaching. The skills taught in this course are considered theoretically (through reading assignments and lectures), experimentally (through role plays, assessment center exercises, and management inventories), and analytically (through written analyses and class discussions). Available only to distance education students enrolled in the AOMP.

PA 420 State and Local Economic Development Policy 3.
In many communities, both rural and urban, the most immediate policy problem confronting public leaders is how to improve the local economy. The purpose of this course is to introduce public leaders to the tasks and challenges in policy development for improving the economies of communities. This course introduces students to the strategies for attracting and retaining public and private investments in a local economy. An individual semester long project will be completed by each student that presents an original economic development strategy, program or project for a specific community (city/town or county).

PA 501 Effective Writing for Public Managers 1.
Focus on professional writing and emphasis on the types of documents most frequently written by public managers. Drafting, editing, audience assessment, and persuasive writing. Student composition of memos, position papers, proposals and instructions.

PA 507 The Public Policy Process 3.
Application of current theories of the public policy process to current issues in public policy and management. Emphasis on the dominant theories of the process, including policy streams, advocacy coalitions, punctuated equilibrium, institutional and rational choice models. Graduate standing or seniors with instructor's permission.

PA 508 Government & Public Administration 1.
Prerequisite: Graduate standing or PBS status.
Public administration and policy making in U.S. political system. Covers Presidency, Congress, Supreme Court, Federal Reserve System, state and local government, intergovernmental relations. Credit is not allowed if student has prior credit for 3 or more undergraduate American government courses.
PA 509 Applied Political Economy 3.
Prerequisite: EC/ARE 401.
Principles governing the interaction of politics and markets, and their application to public policy and public administration. Economic and political market failure, dilemmas of public choice and effects of political institutions. Case studies of public policy-making.

PA 510 Ethics and Professional Practice 1.5.
Prerequisite: MPA student. Corequisite: PA 601.
Workshop on ethical responsibilities of public and nonprofit administrators and codes of ethics used by their professional organizations. Knowledge and problem-solving skills to assess ethical challenges encountered in public and nonprofit administration.

PA 511 Public Policy Analysis 3.
Prerequisite: Graduate standing or PBS status.
Methods and techniques of analyzing, developing and evaluating public policies and programs. Emphasis given to benefit-cost and cost-effectiveness analysis and concepts of economic efficiency, equity and distribution. Methods include problem solving, decision making and case studies. Examples used in human resource, environmental and regulatory policy.

PA 512 The Budgetary Process 3.
Prerequisite: Graduate standing or PBS status.
Examination of generalized budgetary process used at all levels of government in the U.S. Understanding of the process based upon comprehension of institutions involved, roles of politicians and professionals and the objectives of budgetary systems. Focus also upon budgetary reforms and on Planning-Programming-Budgetary and Zero-Based Budgeting as management tools.

PA 513 Public Organization Behavior 3.
Prerequisite: Graduate standing or PBS status.
Major conceptual frameworks developed to understand organization behavior. Motivation, leadership, group dynamics, communication, socio-technical systems, work design and organizational learning. Application of theories and concepts to public sector organizations.

PA 514 Management Systems 3.
Prerequisite: Six hours of graduate PA course work.
Use of management systems by public and nonprofit organizations to monitor and manage their programs. Results-based management approaches, including strategic planning, goal setting, and output/outcome measurement. Ways of increasing managerial effectiveness through the use of structural changes, process improvements, project planning tools, performance-based budget systems, and individual and group rewards.

PA 515 Research Methods and Analysis 3.
Prerequisite: ST 311.
A focus on behavioral approach to study of political and administrative behavior. Topics including philosophy of social science; experimental, quasi and non-experimental research design; data collection techniques; basic statistical analysis with computer applications.

PA 520 Seminar in Urban Management 3.
Prerequisite: Graduate standing or PBS status.
A seminar focusing on analytical techniques and managerial principles required for policy formation and implementation in a complex urban governmental environment. Specific topics including urban planning and community development, housing, intergovernmental relations, organizational roles and decision making, budgeting and selected urban services (for example: police, transportation).

PA 521 Government and Planning 3.
Prerequisite: Graduate standing or PBS status.
The planning function at all levels of government in the U.S., with particular attention to problems posed for planning by rapid growth of metropolitan areas. Overview of community development, urban spatial structure, housing economics and land use planning.

PA 522 Intergovernmental Relations in the United States 3.
Prerequisite: Graduate standing or PBS status.
Examination of distinctive features of intergovernmental relations in the U.S. Topics stressed including historical adaptations of federalism, emerging role of the administrator, contemporary trends in intergovernmental relations and assessment of contemporary trends from federal, state and local perspectives.

PA 523 Municipal Law 3.
Prerequisite: Graduate standing.
A focus on the legal nature of cities as municipal corporations and the legal context in which local governments operate. Specific topics covered including incorporation, ethics, public access to meetings and records, annexation, land use, development, planning, liability, financing, contracting, and personnel actions.

PA 525 Organizational Development and Change Management 3.
This course provides an introduction to the applied skills and knowledge necessary for helping public and nonprofit organizations and agencies effectively manage change. Students will gain knowledge and skills in organizational assessment, action research, systems change, and the stages of change management. Graduate standing only.

PA 530 Financial Management in the Public Sector 3.
Prerequisite: Graduate standing or PBS status.

PA 531 Human Resource Management in Public and Nonprofit Organizations 3.
Prerequisite: Graduate standing or PBS status.
Analysis of major Human Resource practices used by public and nonprofit organizations. Techniques examined include organization (strategy, job analysis, job evaluation, and compensation), staffing (recruitment, retention, testing, and hiring), performance management (appraisal and training & development), and employee relations (grievance & discipline mediation & negotiation, and labor relations).

PA 532 Contract Negotiation and Mediation in the Public and Nonprofit Sectors 3.
Prerequisite: Graduate standing or Management Development Certificate Program and 6 hours of 500-level course work.
Three inter-related leadership skills - negotiation, contracting, and mediation - essential for achieving organizational success. Skills for negotiating with partners, for facilitation among colleagues, for crafting and monitoring contracts for equipment, services, or performance, and for using alternative dispute resolution techniques, primarily mediation.

PA 535 Problem Solving for Public and Nonprofit Managers 3.
Prerequisite: PA 513.
The course introduces a problem solving model specific to public and nonprofit organizations. The model is based on meeting three criteria: effectiveness, efficiency, and equity. Students learn to apply the model in interpersonal and group interactions. The course relies heavily on self-assessment to enable the students to recognize their problem solving propensities and the strengths and limitations of those tendencies.
PA 536 Management of NonProfit Organizations 3.
Prerequisite: PBS status or Graduate standing.
Strategies for developing board leadership, staffing, and managing volunteers, working in multi-cultural environments, developing partnerships with other organizations, conducting government relations. Legal requirements and constraint on nonprofits: incorporation, lobbying, and tax policies.

PA 538 Nonprofit Budgeting and Financial Management 3.
Nonprofit budgeting and financial management practices, including budgeting, financial analysis, cash flow forecasting, internally controlling financial transactions, borrowing, external auditing, investing, managing risk, purchasing and inventory control.

PA 539 Fund Development 3.
Identifies and assesses techniques and best practices of fund development, annual giving, capital campaigns, endowments. Topics include setting achievable goals, organizing and staffing a fund development campaign, and identifying donors. Discusses links between fund development and organization mission and governance, ethical issues, and government regulations. PBS status or Graduate standing.

PA 541 Geographic Information Systems for Public Administration 3.
Prerequisite: Graduate standing, PBS status, Advanced Undergraduate standing with 12 hours in PS program.
Introduction to management of spatial data in relation to public administration databases, including preparation of maps, tables, and data graphics related to geographic information systems in the public sector. Use of ArcView and a variety of other GIS computer applications.

PA 545 Administrative Law 3.
Prerequisite: Graduate standing or PBS status.
Case law of exercise of administrative power, judicial and legislative control of administrative action, legal rights of public employers and legal procedures of administrative tribunals.

PA 546 Seminar in Program Evaluation 3.
Prerequisite: Graduate standing and 6 hours of 500-level courses.
Combination of seminar and field research techniques to study evaluation of public programs. Focus on political and administrative problems associated with program evaluation. Examination of availability and appropriateness of various quantitative methodologies. Seminar concepts applied through evaluative projects conducted for public agencies.

PA 550 Environmental Policy 3.
Prerequisite: Advanced Undergraduate standing including 12 hours of PS program, Graduate standing or PBS status.
Focus on formation and impact of environmental policy in the U.S. Examination on decision-making processes at all levels of government. Comparisons between political, economic, social and technological policy alternatives. Emphasis upon application of policy analysis in environmental assessment and consideration on theoretical perspectives on nature of the environmental crisis.

PA 553 Disaster, Crisis and Emergency Management and Policy 3.
Study of the policies designed to prepare for, respond to, mitigate, and recover from natural and technological hazards, disasters, accidents, or terrorist attacks. Surveys government, nonprofit, and private sector activities in hazards, disasters, emergency and crisis management and policy.

PA 555 Administration of Criminal Justice 3.
Prerequisite: PS 311 or Graduate standing.
Politics and administration in American criminal justice system. Emphasis upon interrelationships between ideology, organization and policy outputs in analysis of major problems confronting the system today. Topics including intergovernmental relations, discretionary justice, impact of judicial decisions on criminal justice administration and management trends in criminal justice bureaucracies. Credit for both PS 555 and PA 555 is not allowed. 3.

PA 580 Independent Study 1-3.
Prerequisite: Graduate standing or PBS status.
Independent research or readings by graduate students under direct supervision of individual faculty members. Students' work evaluated, based on reports, papers and exams.

PA 598 Special Topics in Public Administration 1-6.
Prerequisite: Advanced Undergraduate standing including 12 hours in PS program, Graduate standing or PBS status.
Detailed investigation of contemporary topics in fields of public administration. Topic and mode of study determined by program faculty.

PA 601 Effective Public Communications 1.5.
Corequisite: PA 510.
Written and oral skills and applications needed by public and nonprofit administrators. Includes drafting, editing, and presenting factual and persuasive materials. Use of visual aids, handling question and answer sessions, dealing with media, and holding effective meetings. Composing memos, position papers, and press releases. MPA students.

PA 635 Readings and Research 1-3.
Prerequisite: Graduate standing.
To enable graduate students to pursue a subject of particular interest to them by doing extensive readings or research in that subject under direct, individual faculty supervision.

PA 640 Grantwriting 1.
Survey of funding environment; how to identify foundations, corporation and government funding sources, write proposals, and evaluate proposals.

PA 650 Internship in Public Affairs 1-6.
Prerequisite: Minimum 9 hours graduate work.
Exposure of the student to environment and value systems of the public organization through a supervised work experience. Involving application of substantive knowledge and analytical skills to organizational problems. Credit will vary with nature of the work experience.

PA 651 Advanced Practical Training 1-3.
Prerequisite: 12 graduate credit hours.
Substantive knowledge and analytical skills applied to projects under agency supervision. Participation in monthly on-campus meetings. Credit will not be given for both PA 650 and PA 651. Credit will vary with number of work hours. Must have MPA, current or previous professional work experience.

PA 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.
PA 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

PA 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

PA 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

PA 715 Quantitative Policy Analysis 3.
Prerequisite: ST 407, ST 511, ST 513.
Application of quantitative tools to conduct public policy and administrative research. Course identifies and uses secondary data, including U.S. Census Data, to empirically assess social and economic policies. Emphasis is on the correct selection, use and interpretation of data to answer public policy questions and to understand the strengths and limitations of quantitative analysis.

PA 761 Foundation of Public Administration 3.
Prerequisite: Graduate standing.
Intellectual foundation of public administration and its development as a discipline. Boundaries between public administration and large political process, external political control, factors producing administrative influence and the bases of administrative ethics.

PA 762 Public Organization Theory 3.
Prerequisite: Graduate standing.
Examination of fundamental questions guiding organization research in public administration with emphasis on reconciling democracy and organization. Analysis of classical bureaucratic systems, rational choice, cognitive and organizational economic, and nonlinear and chaos theories.

PA 763 Public Policy Process 3.
Prerequisite: Graduate standing.
Examination of public policy process at federal level in the United States. Analysis of constitutional foundations of this process and the role of governmental institutions, political culture, parties, interest groups, and public opinion in policy making. Case studies of policy making and implementation in selected policy areas.

PA 764 Budgeting and Financial Management 3.
Prerequisite: PA 512.
Examination of budgetary and financial management processes in governmental and nonprofit agencies. Budgetary and financial management theory, practice, and unanswered research questions.

PA 765 Quantitative Research in Public Administration 3.
Prerequisite: PA 515; ST 507.
Review of quantitative procedures commonly applied in public administration with emphasis on applications found in leading journals in the discipline. Exploration of data acquisition, appropriate research design, selection of procedures, data assumptions of procedures, and common errors in the research process and in statistical analysis.

PA 766 Advanced Quantitative Research in Public Administration 3.
Prerequisite: PA 765.
Review of advanced quantitative procedures commonly applied in public administration research with emphasis on multivariate models found in leading journals in the discipline. Illustrative topics include the application of specialized regression models, generalized linear models, event history models, mixed and multilevel models, and structural equation models to topics in public administration.

PA 770 Contemporary Public Management 3.
Prerequisite: PA 514.
Current public management practices, including evaluation of their underlying theoretical assumptions and of empirical evidence about their effectiveness. Causes of recent shifts in public management theory; political implications of management choices; privatization in theory and practice; managerial use of performance measurement systems; customer feedback systems; worker incentive structures.

PA 771 Seminar on Nonprofit Organizations 3.
Course provides the necessary theoretical foundation to design scholarly research on nonprofit organizations, voluntary action, and the nonprofit sector. Topics focus on the historical and philosophical roots of the nonprofit sector, the theories used to frame scholarly research and answer contemporary research questions. Students assume a leadership role in shaping the course content. Doctoral students only.

PA 780 Independent Study 1-3.
Prerequisite: Graduate standing or PBS status.
Independent research or readings by graduate students under direct supervision of individual faculty members. Students' work evaluated, based on reports, papers and exams.

PA 798 Special Topics in Public Administration and Policy 1-3.
In depth exploration of specialized or emerging topics in public administration or public policy. Student presentations on readings and research projects. Also used to test and develop new courses.

PA 803 Advanced Research Design 3.
Prerequisite: Doctoral student in Public Administration; PA 765, Corequisite: At least two graduate methodology or statistics courses.
Philosophy and objectives of social scientific research with focus on basic and applied research, need for hypothesis development and testing as a basis of scientific research, inductive and deductive reasoning. Emphasis on preparation of research design of dissertation, published articles, and technical presentations. Students will present a research prospectus that will serve as the basis for their dissertation.

PA 810 Special Topics in Public Administration 1-6.
Prerequisite: Advanced Undergraduate standing including 12 hours in PS program, Graduate standing or PBS status.
Detailed investigation of contemporary topics in fields of public administration. Topic and mode of study determined by program faculty.

PA 835 Readings and Research 1-3.
Prerequisite: Graduate standing.
To enable graduate students to pursue a subject of particular interest to them by doing extensive readings or research in that subject under direct, individual faculty supervision.
PA 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

PA 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate faculty.

Prerequisite: Doctoral student.
Dissertation research.

PA 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Religious Studies (REL)

REL - Religious Studies Courses

REL 200 Introduction to the Study of Religion 3.
Historical, theoretical, and methodological introduction to the study of religion. Critical analysis of development of the discipline of Religious Studies. Preparation for all advanced study in Religious Studies theory and method, as well as training to study religious traditions of the world.

REL 210 Religious Traditions of the World 3.
Major Eastern and Western religious traditions with attention to their basic teachings and practices as well as to the historical, geographical, social, and political settings in which they have arisen and developed.

REL 230 Asian Religions 3.
Asian religious traditions in comparative perspective. Religious and cultural history through literature, film, and art of India, Pakistan, Bangladesh, Sri Lanka, Nepal, Afghanistan, China, Japan, Korea, and other countries in the region. Doctrine, practice, teaching tales, and issues of change and conflict.

REL 298 Special Topics in Religious Studies 3.
Selected studies in religion that do not appear regularly in the curriculum. Topics will be announced for each semester in which the course is offered.

REL 309 Religion and Society 3.
Prerequisite: 3 cr. in SOC, 200 level.
Religious beliefs, practices and organizations addressed as social phenomena. Structural functionalism, conflict and subjectivism as theoretical orientations for understanding influences between religion and society. Relationship of religions to family, government, and economy and to social divisions, conflict and change.

REL 311 Introduction to the Old Testament 3.
Study of Old Testament books, examining their content, background and development. Comparisons of the biblical material with other Ancient Near Eastern literature. Assessment of contributions from archaeology and literary studies to clarifying the text.

REL 312 Introduction to the New Testament 3.
Literary and historical study of the New Testament in its Jewish and Greco-Roman contexts. Special attention to distinctive characteristics of the Gospels and their relationships, early controversies with Judaism and the emergence of church structure and teaching.

REL 314 Introduction to Intertestamental Literature 3.
Intertestamental literature in the context of Jewish history, institutions and beliefs of the Intertestamental Period (ca. 300 B.C.-ca. 100 A.D.).

REL 317 Christianity 3.
Development of Christianity from its origins to the present; events, persons, ideas, beliefs and practices which were most significant in this development.

REL 320 Religion in American History 3.
Prerequisite: 3 hours of History or Sophomore standing.
Representative people, movements and thought in the major religions within the context of American society and culture.

REL 323 Religious Cults, Sects, and Minority Faiths in America 3.
Religious cults, sects and minority faiths in America, including Mormonism, Christian Science and Jehovah's Witnesses. Also covers such alternate groups as the holiness-charismatic movement and the Unification Church. Origins, development and teachings of these groups within the context of American culture and religion.

REL 327 Issues in Contemporary Religion 3.
Responses of contemporary Western religious thinkers to critics of religion and to challenges posed by the 20th century including the Nazi Holocaust, social injustice (liberation theologies - black, feminist, Third World), ecological crisis, threat of nuclear warfare, and conflicts between religions.

REL 331 The Hindu Tradition 3.
Basic religio-philosophical concepts, social institutions, and individual practices of Hindu civilization from earliest Vedic times to the present. Focus on major traditions: Action (karma), Knowledge (jnana), and Devotion (bhakti), with emphasis on disciplines (yoga), myth, symbol, art.

REL 332 The Buddhist Traditions 3.
History and structure of the Buddhist tradition analyzed through the "three jewels": the Buddha, the Monastic Community (sangha), and the Teachings (dharma). Emphasis on fundamental religio-philosophical concepts, social history and ritual practices of Southern Buddhism, early Mahayana development, and Tantric ideals. Growth of the traditions in China and Japan.

REL 333 Chinese Religions 3.
Survey of Chinese religions from prehistoric times to present. Confucianism, Daoism, primary Buddhist schools in China, spirit possession, divination and popular religious worship.

REL 334 Japanese Religions 3.
Survey of various strands of Japanese religious life from prehistoric times until present. Kami worship; primary Buddhist schools in Japan; Japanese Christianity; Confucianism; and New Religions.
REL 340 Islam 3.
Introduction to the Islamic religious tradition. Examination of the primary historical, literary, and theological sources for Islamic religious thought in global contexts. Topics include the Prophet Muhammad, the development of the early Muslim community, Islamic religious practice, Sunnī and Shi‘ī Islam, Sufism, theology, law and Islamic art and architecture.

REL 350 Introduction to Judaism 3.
A survey of Jewish religious traditions from the Bible through the present day. Evolution of major religious ideas through classical texts including Torah, Talmud, philosophical and mystical literature, and contemporary fiction.

REL 383 Religion, Globalism, and Justice 3.
Prerequisite: One course in religion, philosophy, history, political science, anthropology or sociology.
Issues and problems in religion and societies since 1945. Historical, theoretical, sociological, and cultural approaches to globalization and religion. Inquiry into the role of ethical reasoning in religious debates on the problem of globalization.

REL 402 Early Christianity to the Time of Eusebius 3.
Prerequisite: One of: REL 312, REL 317, or HI 207.
Growth and diffusion of early Christianity from the end of the first century up to the time of Eusebius and the conversion of Constantine (early fourth century); Christianity in its Greco-Roman environment; Roman policy towards Christianity; heterodox Christian movements; anti-heretical writings; orthodox institutions of authority.

REL 407 Islamic History to 1798 3.
Prerequisite: 3 hrs. of History.
Credit will not be given for both HI 407 and HI 507. The history of the Islamic Near East to 1798. Topics include the East Mediterranean before Islam, Muhammad and the development of Islam, sources of Muslim civilization, Islamic law, science, philosophy, art and architecture, Islam in Spain, India, Asia and Africa, the Crusades, the Ottomans, Islam and Europe.

REL 408 Islam in the Modern World 3.
Prerequisite: 3 hours of history or religious studies.
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamicate empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL/HI 408 and REL/HI 508.

REL 412 Advanced Readings in the Christian Gospels 3.
Prerequisite: REL 312 or REL 317.
Close study of the varieties of gospel writings, both canonical and non-canonical, in early Christianity. Analysis of the constituent features of the gospels (parables, healing narratives, sermons), and their "pre-history"; the use of the gospels in the reconstruction of the life and ministry of Jesus; and critical methods in gospel research.

REL 413 The Life and Letters of the Apostle Paul 3.
Prerequisite: REL 312 or REL 317.
Intensive study of the apostle Paul and his writings in their historical, literary and religious contexts. Sources for the life and ministry of Paul; the structure and theology of the Pauline and deuto-Pauline epistles; the influence and image of Paul in early Christianity; and contemporary controversies and issues in the study of Paul.

REL 423 Religion and Politics in America 3.
Prerequisite for REL 423: one 300-level course in religion, philosophy, or history.
Issues and problems in religion and politics in the United States since 1900. Historical, theoretical, sociological, and cultural approaches to religion and politics. Inquiry into the relations between religion and the state. Responses of religious traditions to American social and political issues. Students cannot receive credit for both REL 423 and REL 523.

REL 471 Darwinism and Christianity 3.
Prerequisite: One course in religious studies, biological sciences, philosophy of science, or history of science. Credit is not allowed for both REL 471 and REL 571.
Evolutionary biology and Christianity. Darwin’s evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in an evolutionary world.

REL 472 Women and Religion 3.
Prerequisite: one course in religious studies or women’s and gender studies.
Historical, literary, and theological sources dealing with portrayals of women and women’s religious experience in several religious traditions of the world through different historical periods, from ancient to modern. Impact of feminist theory on the academic study of religion; methodological issues surrounding the study of women’s religious history; role of religion in shaping attitudes toward women and their status in society. Students cannot receive credit for both REL/WGS 472 and REL/WGS 572.

REL 473 Religion, Gender, and Reproductive Technologies 3.
Credit is not allowed for both REL 473 and REL 573.
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the “natural”. Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Analyzes the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for both REL 473 and REL 573.

REL 474 Religion and Conflict 3.
Prerequisite: A 300 or above level Religion course.

REL 482 Religion and Conflict 3.
Prerequisite: A 300 or above level Religion course.

REL 489 Interpretations of Religion 3.
Prerequisite: One course in religion, philosophy, anthropology, history, or sociology.

REL 491 Advanced Readings in Theological and Religious Literature 3.
Prerequisite: 300-level course in Religion.
Critical analysis of advanced theological works; close reading of primary texts; methods of interpretation (hermeneutics). Course may be used for individualized study programs by arrangement with the instructor.
REL 496 Seminar in Religious Studies 3.
Prerequisite: 300-level course in Religion.
Advanced research and writing in selected topics; application of contemporary and historical methods for the study of religion; hermeneutic theory. Open primarily to Religious Studies majors and minors.

REL 498 Special Topics in Religious Studies 1-6.
Prerequisite: 6 hours REL.
Detailed investigation of selected topics in religion. Topics determined by faculty members in consultation with head of the department. Course may be used for individualized study programs.

REL 508 Islam in the Modern World 3.
Prerequisite: Graduate Standing.
Evolution of modern Islam from 17th century to the present. Primary emphasis on North Africa, the Middle East and South Asia. Pre-modern Islamicate empires, reform and revival. Historical origins of current issues in the Islamic world. Students cannot receive credit for both REL HI 408 and REL HI 508.

REL 523 Religion and Politics in America 3.
Prerequisite for REL 523: graduate standing.
Issues and problems in religion and politics in the United States since 1900. Historical, theoretical, sociological, and cultural approaches to religion and politics. Inquiry into the relations between religion and the state. Responses of religious traditions to American social and political issues. Students cannot receive credit for both REL 423 and REL 523.

REL 571 Darwinism and Christianity 3.
Prerequisite: Graduate Standing.
Evolutionary biology and Christianity. Darwin's evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in an evolutionary world.

REL 573 Religion, Gender, and Reproductive Technologies 3.
Prerequisite: Graduate Standing.
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the "natural". Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Examines the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for both REL 473 and REL 573.

REL 582 Religion and Conflict 3.
Credit is not allowed for both REL 582 and 482. Graduate Standing Required.

Science, Technology and Society (STS)

**STS - Science, Technology and Society Courses**

**STS 210 Women and Gender in Science and Technology 3.**
Interdisciplinary introduction to the reciprocal relationships between scientific/technological research and contemporary understanding of gender. Special emphasis on social factors influencing scientists and engineers in their professions.

**STS 214 Introduction to Science, Technology, and Society 3.**
Introduction to the field of Science, Technology, and Society (STS), including most important STS scholars, major schools of thought, and important theoretical and empirical issues in STS.

**STS 257 Technology in the Arts 3.**
The interaction between technology and the arts with an emphasis on developments in Western art of the twentieth century. Historical and emerging issues include: sound and film recordings, the addition of sound to films, the impact of films and television on theater, the impact of radio, computer applications to music, the visual arts, and literature.

**STS 301 Science and Civilization 3.**
Prerequisite: Sophomore standing.
An inquiry into the scientific achievement and cultural impact of three different, but interrelated, models (or paradigms) of understanding the world and man's place in it; the Ancient-Medieval model of Aristotle, Ptolemy and Aquinas; the 17th century model of Newtonian physics; and the emerging, but fragmentary, 20th century model based upon the new physics of Einstein, Planck and Heisenberg.

**STS 302 Contemporary Science, Technology and Human Values 3.**
Prerequisite: Sophomore standing.
Interdisciplinary evaluation of recent and potential influences of current scientific and technological developments on US and non-US societies. Emerging social, ethical, and intellectual issues include: The adequacy of contemporary scientific frameworks; the relations among science, technology, and society; the social consequences of scientific and technological applications, and human prospects and possibilities.

**STS 304 Ethical Dimensions of Progress 3.**
Multidisciplinary examination of traditional western notion of progress, focusing on ethical issues raised by concept of progress, and connections between science, technology and society. Places relationships such as engineering and social responsibility within the context of present day redefinitions of the notion of progress.

**STS 322 Technological Catastrophes 3.**
Prerequisite: Sophomore standing.
Interdisciplinary examination of the human, organizational and technical factors contributing to the causes and impacts of recent technological accidents such as the Bhopal chemical leak, the space shuttle Challenger explosion, the Chernobyl nuclear accident, and the Exxon Valdez oil spill. Evaluation of risk assessment, risk perception and risk communication strategies. Consideration of options for living with complex technological systems.

**STS 323 World Population and Food Prospects 3.**
Examination of the dynamics of population size and food needs, production, distribution and utilization. Consequences of inadequate nutrition and food choices, efforts to increase the compatibility of effective food production systems and alternate crops and cropping systems examined.
STS 325 Bio-Medical Ethics 3.
Interdisciplinary examination and appraisal of emerging ethical and social issues resulting from recent advances in the biological and medical sciences. Abortion, euthanasia, physician-assisted suicide, compromised infants, aids, reproductive technologies, and health care. Focus on factual details and value questions, fact-value questions, fact-value interplay, and questions of impact assessment and policy formulation.

STS 402 Peace and War in the Nuclear Age 3.
An interdisciplinary examination of contemporary wars and international conflict, arms, races, nuclear strategy and defense policy, arms control, theories and strategies of peace.

Prerequisite: STS 214, STS or STB Majors.
Capstone course for the Science, Technology, and Society (STS) major. Review of the principal theoretical and empirical issues of the field. Research project focused on each student’s STS specialty.

STS 405 Technology and American Culture 3.
An interdisciplinary study of the role of technology in American culture which examines the ideological, political, social, economic, and institutional contexts of technological change from the 1760’s to the present, and explores the cultural impacts of new technological systems.

STS 471 Darwinism and Christianity 3.
Prerequisite: One course in religious studies, biological sciences, philosophy of science, or history of science.
Evolutionary biology and Christianity. Darwin’s evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in an evolutionary world.

Prerequisite: Junior standing.
Examination of a significant issue, method, or historical episode in the area of science, technology, and society.

STS 491 Independent Study in Science, Technology, and Society 3.
Independent investigation and discussion of a selected topic in science, technology, and society. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

STS 571 Darwinism and Christianity 3.
Prerequisite: Graduate standing.
Evolutionary biology and Christianity. Darwin’s evolutionary theory; neo-Darwinism; conflicts between evolutionary theory and Christian thought; methodological parallels and differences between science and religion; proposals for divine action in an evolutionary world.

Social Sciences (SSGE)

SSGE - SSGE Courses

SSGE 295 Social Sciences Special Topics 3.
Special topics course offering for the general education Social Sciences category.

Social Sciences and Global Knowledge (SSGK)

SSGK - SSGK Courses

SSGK 295 Social Sciences and Global Knowledge Special Topics 3.
Special topics course offering for the general education Social Sciences and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Social Sciences (SS) requirement.

Social Sciences and U.S. Diversity (SSUS)

SSUS - SSUS Courses

SSUS 295 Social Sciences and U.S. Diversity Special Topics 3.
Special topics course offering for the general education Social Sciences and U.S. Diversity categories. This course may be used for the U.S. Diversity (USD) co-requisite and/or for the Social Sciences (SS) requirement.

Social Work (SW)

SW - Social Work Courses

SW 201 Community Social Services 4.
This course, the basis for all other social work courses, provides an introduction to generalist practice and an overview of social work practice in a variety of settings. Successful completion of this course is a prerequisite for all advanced SW courses. This course is designed to acquaint students with social services typical of most American communities: what they are, who uses them, their impact, who pays for them, and who works in them. 40-hour pre-professional placement required, intern liability insurance required. Transportation to and from agency and/or community settings is the responsibility of the student.

SW 260 Introduction to Gerontology: An Interdisciplinary Field of Practice 3.
An integrative seminar in introducing students to gerontology as an interdisciplinary field of practice. The course provides an overview of topics such as the demography of older adults and the physical, cognitive, and psychosocial aspects of aging. The course also covers health care and social policies that impact older persons and caregivers along with the aging network of services. Students will discuss forms of oppression such as ageism, sexism, racism, able-body(ism), and homophobia that impacts work with older people as well as strategies to promote social and economic justice.

This course reviews the major policy and program developments in American social welfare and the emergence and development of professional social work. Emphasis will be on the socio-cultural context of policy and programs, and the ideas and ideals that shape social welfare. In addition, the basic elements of social policy development will be considered. This course provides the history, mission, philosophy, and evolution of social welfare policies and services that form the foundation of social welfare, particularly as they relate to poverty, racism, and efforts to address the needs of oppressed and marginalized populations.
P: ST 311; R: Social Work Majors/Minors.
Course provides an overview of the principles and methods of basic social work research. Substantive research knowledge, quantitative and qualitative research methodology are highlighted. Research ethics within the context of social work purposes and values are emphasized. Course exposes students to how high quality research in social work is designed and conducted and how it can assist in making important decisions about the design and implementation of projects, programs, and policies that address the social needs of diverse groups.

Prerequisite: SW 290.
Course enables students to understand the processes by which social welfare policies are developed and implemented as well as the ways in which people can intervene to affect these processes. Students have the opportunity to review recent developments in national and state social welfare policies and programs in major areas such as poverty, welfare, social security, housing, health and mental health care, and child welfare. The course focuses on the development of students' policy analysis and advocacy skills.

Prerequisite: SW 201.
Designed to introduce theory regarding human life/development for students intending to practice social work. Students learn to recognize ways in which diversity characterizes and shapes the human experience and is critical to the formation of identity, the extent to which a culture's structures and values may oppress, marginalize, alienate, create or enhance privilege and power. Course surveys major theoretical frameworks and normative developmental variations. Students learn to apply these theories and knowledge from the liberal arts to understand biological, psychological, social, cultural, and spiritual development. Transportation to and from agency and/or community setting is the responsibility of the student.

SW 312 Multicultural Social Work 3.
Course prepares students to work with diverse groups of people locally and globally defined by gender, ethnicity, race, national origin, sexual orientation, income, physical and mental ability, age and religion. Emphasis is placed on defining and developing skills for culturally competent social work generalist practice with these populations through students' self-examination, experiential learning, and critical reading of class material. This course helps students develop competencies in critical self-reflection, multicultural values and ethics, knowledge, awareness and skills in a variety of ways so that they can work against manifestations of social injustice. Students are expected to provide their own transportation as needed.

SW 320 Social Work Practice I 4.
Corequisite: Social Work Majors, and a prerequisite or corequisite of SW 310.
First of a three-course sequence. Practice I presents the generalist social work practice method and focuses on interviewing skills, engaging clients in the helping process, and integrating theory and social work practice. It addresses ethical and professional standards and emphasizes understanding and applying systems and ecological frameworks to practice situations. It examines strengths-based assessment, the phases of the helping relationship, and the dynamics of change in interpersonal helping relationships, within a framework of human rights, social justice, and diversity. 40-hour preprofessional placement required; intern liability insurance required. Transportation to and from agency and/or community settings is the student's responsibility.

SW 405 Social Work Practice II 4.
Prerequisite: Social Work Majors, SW 320, Corequisite: SW 480/SW 408.
Second of a three-course sequence (Practice I, II, and III). Practice II examines generalist social work roles and techniques with families and groups. Building on the foundation interviewing and engagement skills presented in Practice I, it focuses on assessment, planning, and intervention with individuals, families and small groups within a framework of human rights, social justice, and diversity. 40-hour preprofessional placement is required, intern liability insurance is required. Transportation to and from agency and/or community settings is the student's responsibility.

SW 408 Social Work Practice III 3.
Prerequisite: Social Work Majors, SW 320, Corequisite: SW 405, SW 480.
Course prepares students for practice will organizations, communities, policy structures, and institutions that are viewed as both tools and targets for change efforts. Course emphasizes multiculturalism, diversity, and social justice in relation to social systems. It is designed to provide social work practitioners with the means to help organizations and communities empower themselves to make change through networking, political participation, leadership development, mobilization, utilization of resources, and other strategies and techniques. Transportation to and/or from community settings is the responsibility of the student.

SW 412 Social Work in Schools 3.
Prerequisite: Nine credits in Social Work courses, including SW 320. Models and roles relevant to school social work practice. Cooperative work with school personnel in the identification, prevention and treatment of social, emotional and behavioral problems of children and interventive techniques with parents and community groups. For individuals preparing for social work practice in the public schools and for school social workers seeking licensure.

SW 413 African American Families: History, Tradition, and Community 3.
Prerequisite: Sophomore standing.
Characteristics, traditions, history and strengths of African American families and their relationship to other social institutions, social advocacy and social policy development. African-centered worldview and relevant theory pertaining to best practice with African American families.

SW 415 Child Welfare 3.
Prerequisite: SW 201.
Generalist perspective on the practice of public child welfare. History of child welfare, practices in child welfare, and current trends in child welfare programs. Skills needed to practice in child protective services, adoption, and foster care with specific attention to the North Carolina child welfare system. Application of cultural diversity and cultural competency integrated throughout as it relates to child welfare issues.

Prerequisite: SW 310.
Knowledge and skills in identifying Alcohol and Other Drugs (AOD) problems, screening, assessment, intervention, referral, and prevention: history of AOD problems and treatment, AOD classification, effects and signs/symptoms of AOD, models of addiction, diversity, assessment, diagnosis, intervention, treatment modalities, mutual-help groups, family dynamics, prevention, and ethical considerations. Students cannot receive credit for both SW 416 and SW 516.
SW 417 Direct Practice with Older Adults. 3.
Physical, psychological, social, and cultural theories of the aging process as it relates to social work practice, social policy, and services for working with older adults and their families. Emphasis on mental and physical well-being, diversity, social and economic justice, intergenerational issues, policy and programs. Credit is not allowed for both SW 417 and SW 517.

Prerequisite: Students are Participants in the NC Child Welfare Education Collaborative Program.
Best practice seminar for participants in the NC Child Welfare Education Collaborative Program. Seminars focus on current issues in child welfare practice and policy. Topics vary from semester to semester. Students arrange own transportation for occasional field trips to community agencies.

SW 420 The Legal Aspects of Social Work 3.
Prerequisite: Social Work Majors and Social Work Minors.
Legal environment of the social work profession. Relationships among legal processes, the delivery of social work services and client problems.

A seven week learning experience in Guatemala. Through this course, the student will develop a global perspective of social welfare and social work practice, will learn about the people and culture of the Lake Atitlan area of Guatemala, will learn the variety of resources available in response to social need, and will enhance or develop Spanish language competence. All costs associated with learning opportunities and activities for this course are included in the cost of the program.

SW 480 Preparation for Field Work 1.
Prerequisite: Social Work Majors, SW 320, Corequisite: SW 405, SW 408.
Introduction to aspects of field placement process and necessary skills for a successful internship. Application, interview, ethical practice, documentation, supervision and learning contract.

SW 490 Field Work in Social Services 12.
Prerequisites: Social Work Majors, SW 405, SW 408, and SW 480; Corequisite: SW 491.
Supervised placement in a social service organization; demonstration of CSWE core competencies and professional practice behaviors. Weekly integrative seminar. Intern liability insurance required. Students are expected to provide their own transportation to the internship site.

SW 491 Community-Based Field Practicum 9.
Prerequisites: SW 405 and SW 408 and SW 480; Corequisite: SW 490.
This nine-credit course is a co-requisite for, and is taken in conjunction with, SW 491 during the BSW student's final semester. Students must complete a range of 450 to 480 hours of supervised field agency practicum in an approved community-based agency. It serves as a direct practice component of the culmination of knowledge gained in the BSW courses. Field placement provides students the opportunity to practice social work skills under the supervision of a professional social worker and apply evidence-informed practices, with emphasis on social and economic justice, in their work with individuals, families, groups, organizations, and communities.

SW 495 Special Topics in Social Work 3.
Detailed investigation of a topic in social work. Topic and mode of study determined by faculty member.

Prerequisite: Junior standing or Senior standing, Social Work Majors or Social Work Minor, Nine credits in social work courses. Independent or small group study of a social work practice or social welfare area. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

SW 500 Advanced Standing Seminar 4.
Corequisite: SW 505.
Orients advanced standing students to the Department and the MSW Program; provides connection between the BSW curriculum and advanced MSW curriculum; assures attainment of CSWE Foundation Curriculum Competencies; provides opportunities to demonstrate/evaluate practice skills of engagement, assessment, intervention, and evaluation; assists students with successful entry into advanced MSW program of study and advanced field placement. For graduate students in the advanced standing program.

SW 501 Social Work Policy, Services and Programs 3.
Provides students with an understanding of and critical perspective on the development of social systems, social policy and the profession of Social Work in the United States. Examination of the history, mission, philosophy, and evolution of social welfare polices and services that form the foundation of social welfare, particularly as they relate to poverty, racism, and efforts to address the needs of oppressed and marginalized populations.

Theoretical and experiential knowledge related to oppression, privilege, and social and economic justice. Particular attention is given to persons and groups most affected by oppression and mechanisms that advance the achievement of a more just society.

An overview of normative individual and family development trajectories through the life cycle and survey of major theoretical frameworks and normative development variations: Theories of individual, familial, and group interaction and ways that informal groupings and support networks function to maintain individual and family well-being and stability. Admission to the MSW program or permission of the instructor.

Prerequisite: ST 311.
Social work research methods, interpretation of empirical research findings within the context of social work practice. Major activities include 1) identification of the steps of the research process, 2) utilization of mixed methodologies, 3) assessment of empirical research studies, and 4) discussion of human diversity and ethical issues in research design and implementation. Admission to the MSW Program and ST 311 or equivalent.

P: SW 505 & SW 510.
Second of three courses in social work research. Evaluating social work practice and health and human services programs within different research paradigms. Prepares students for collecting, analyzing, and reporting qualitative and quantitative data; includes laboratory experience. Restricted to students who have completed all foundation courses in the MSW program.
SW 515 Child Welfare 3.
Generalist perspective on the practice of public child welfare. History of child welfare, practices in child welfare, and current trends in child welfare programs. Skills needed to practice in child protective services, adoption, and foster care with specific attention to the North Carolina child welfare system. Application of cultural diversity and cultural competency integrated throughout as it relates to child welfare issues. Credit is not allowed for both SW 415 and SW 515.

Knowledge and skills in identifying Alcohol and Other Drugs (AOD) problems, screening, assessment, intervention, referral, and prevention: history of AOD problems and treatment, AOD classification, effects and signs/symptoms of AOD, models of addiction, diversity, assessment, diagnosis, intervention, treatment modalities, mutual-help groups, family dynamics, prevention, and ethical considerations. Credit is not allowed for both SW 416 and SW 516.

SW 517 Direct Practice with Older Adults 3.
Physical, psychological, social, and cultural theories of the aging process as it relates to social work practice, social policy, and services for working with older adults and their families. Emphasis on mental and physical well-being, diversity, social and economic justice, intergenerational issues, policy and programs. Credit is not allowed for both SW 417 and SW 517.

Best practice seminar for participants in the NC Child Welfare Education Collaborative Program. Seminars focus on current issues in child welfare practice and policy. Topics vary from semester to semester. Students arrange own transportation for occasional field trips to community agencies. Required for members of the NC Child Welfare Education Collaborative Program.

SW 520 SW Generalist Practice I 3.
C: SW 505 and SW 651.
Provides the foundation knowledge and skills needed to engage and assess individuals, families and groups. Examines underlying theories and models of research-informed practice and evidence-based social work interventions with particular emphasis on the ecological systems model from a strengths perspective. Presents the phases and dynamics of change in interpersonal helping relationships within a framework of human rights, social justice, and diversity. Restricted to students admitted to the MSW program.

SW 521 SW General Practice II 3.
P: SW 505 & SW 520; C: SW 652.
Prepares students for Social Work practice within organizations, communities and policy structures. Emphasizes multiculturalism, diversity, and social justice in relation to social systems. Restricted to students admitted to the MSW program.

This course provides an in-depth analysis of social policy development in the urban context and the multi-dimensional nature of environments, communities, and individuals. Popular media (newspaper and journal articles, film, television, and textbooks) will proxy as a microcosm of contemporary social welfare problems and purported solutions. Following an ethical and social justice paradigm, this course will examine the portrayals of the urban experience and the attendant social problems of life (crime, drugs, economic bifurcation, educational system, and the media) in an economically depressed or struggling major metropolitan area.

A seven week learning experience in Guatemala. Through this course, the student will develop a global perspective of social welfare and social work practice, will learn about the people and culture of the Lake Atitlan area of Guatemala, will learn the variety of resources available in response to social need, and will enhance or develop Spanish language competence. All costs associated with learning opportunities and activities for this course are included in the cost of the program.

SW 550 Advanced Social Work Practice with Families 3.
Prerequisite: SW 652, Corequisite: SW 654.
Theories, concepts, and skills needed for practice with diverse, at-risk family populations. Includes overview of historical and current social work approaches to family intervention as well as skill development in contemporary intervention methods. Focuses on understanding families within their cultural and community contexts, and presents several family intervention models useful for helping families build on their strengths to cope with a variety of family constellations, changes, and challenges.

SW 551 Social Work Practice with Children and Adolescents 3.
Prerequisite: SW 521 and SW 652.
Focuses on assessment and intervention strategies for clinical practice with children and adolescents. Explores issues common to these client groups.

SW 557 SW Program Development and Grant Writing 3.
Prerequisite: SW 561 & SW 653; Corequisite: SW 654.
Provides a comprehensive introduction to program development and grant writing in social work. Examines the major steps in the process including problem identification, needs assessment, program planning, and resource identification and development. Designed to provide a hands-on approach to developing grant writing and other resource development skills. Restricted to students who have completed all foundation courses in the MSW program.

SW 560 Advanced Policy Practice with Organizations and Communities 3.
Prerequisite: SW 501 & SW 521.
Second of two courses on social policy. Examines how social workers collaborate with organizations and communities to intervene in social policy. Strategies for policy practice include values clarification, legislative advocacy, analytic advocacy, and implementation advocacy. These strategies build upon concepts and skills from community development, social planning, and community organizing. Emphasis is given to working with economically disadvantaged and historically disempowered communities. Restricted to students who have completed all foundation courses in the MSW program.

SW 561 Social Work Administration and Supervision 3.
Prerequisite: SW 521 & SW 652.
Addresses the theoretical frameworks and functions of managing human service organizations. Explores personal and professional values and ethical dilemmas in exercising leadership in the management of culturally diverse community groups, boards and committee meetings. Issues of staff development, team building, group decision-making, problem solving strategies, legal structure, governance, funding, accountability systems, and human resources will be discussed. Restricted to students who have completed all foundation courses in the MSW program.
SW 571 Community Mental Health 3.
Prerequisite: SW 691.
Focuses on social work practice in the field of Mental Health. Reviews policy and practice as it pertains to the promotion of mental health, the prevention of mental illnesses, and the delivery of psychosocial treatment. Strategies and practice for use at the individual, family, group, organizational, community, and societal levels are explored. Master of social work required.

Prerequisite: SW 653.
Capstone course taken in the final semester of the MSW program intended to help students integrate all coursework in preparation for graduation and professional practice. Directs students to apply promising practices to their professional work and encourages students to interact and blend perspectives from both direct practice and community partnership concentration options.

SW 581 Advanced Social Work Practice with Individuals 3.
Prerequisite: SW 521 and SW 652.
Prepares the student for advanced generalist practice with individuals who are experiencing a range of complex life challenges. Focus on traditional and emerging social work practice theories used by social workers to assist individuals in experiencing external and/or internal stressors. Interventions with diverse populations risk. Restricted to students who have completed all foundation courses in the MSW program.

SW 582 Advanced Social Work Practices with Groups 3.
Prerequisite: SW 521 and SW 652; Corequisite: SW 653.
Focuses on advanced social work practice with groups. Uses ecological systems and empowerment perspectives to explore major theories of social work practice with groups. Critical examination of contemporary issues in designing and evaluation group interventions in assessing their impact on individual and social change. Restricted to students who have completed all foundation courses in the MSW program.

SW 583 Advanced Social Work Practice with Family Systems 3.
Prerequisite: SW 521 and SW 652; Corequisite: SW 654.
Theories, concepts, and skills needed for practice with diverse, at-risk families. Overview of historical and current social work approaches to family intervention as well as skill development in contemporary methods. Focuses on understanding families within their cultural and community contexts and presents several family intervention models useful for helping families build on their strengths to cope with a variety of family constellations, changes, and challenges experienced throughout their lifespan. Restricted to students who have completed all foundation courses in the MSW program.

SW 590 Social Work Capstone 2.
Integration of ecological systems and empowerment perspectives with concepts of intersectionality and covert and overt oppression in group and organizational life leading to design and implementation of a capstone project reflecting mastery of all curricular content and demonstrating readiness to practice as an MSW level professional social worker. Restricted to students who have completed the first semester in the Advanced Year of the MSW Program.

SW 595 Special Topics in Social Work 3-6.
Prerequisite: Graduate standing.
In-depth exploration of specialized or emerging topics in social work or social welfare. Topic of current interest and mode of study determined by faculty member. Also used to test and develop new courses.

SW 630 Independent Study in Social Work 1-3.
Prerequisite: Master of Social Work, SW 510.
An independent study addressing an area of social work practice or social welfare.

SW 651 Social Work Field Internship I 5.
C: SW 505 & SW 520.
First course in a two-course foundation sequence that provides students the opportunity to use generalist practice social work skills in a field agency under the supervision of an MSW social work practitioner.

SW 652 Social Work Field Internship II 5.
Prerequisite: SW 520 and SW 651. Corequisite: SW 521.
Second course in a two-course foundation field internship sequence that provides students the opportunity to use generalist practice social work skills in a field agency under the supervision of an MSW social work practitioner.

SW 653 Advanced Social Work Field Internship I 5.
C: SW 512 or 557 or 561 or 581 or 582.
First course in the advanced field internship sequence that provides students the opportunity to use advanced generalist practice social work in a field agency under the supervision of an MSW social work practitioner.

SW 654 Advanced Social Work Field Internship II 5.
Prerequisite: SW 653; Corequisite: SW 560 or SW 561 or SW 583 or SW 590.
Second course in the advanced field internship sequence that provides students the opportunity to use advanced generalist practice social work skills in a field agency under the supervision of an MSW social work practitioner.

Sociology (SOC)

SOC - Sociology Courses

SOC 202 Principles of Sociology 3.
Introduction to sociology. Analyses of key processes and institutions including interaction, inequality, organization, socialization, and social change. Includes core sociological concepts, methods, theories.

SOC 203 Current Social Problems 3.
Examination of social problems linked to structures of economic, political, gender and racial inequality; including poverty, disease, racism, sexism, unemployment, psychological distress, educational failure, environmental destruction and violence. Possible solutions viewed from a variety of perspectives. Includes core sociological concepts, methods and theories.

AGI Students Only.
Examination of social problems linked to structures of economic, political, gender and racial inequality; including poverty, disease, racism, sexism, unemployment, psychological distress, educational failure, environmental destruction and violence. Possible solutions viewed from a variety of perspectives. Includes core sociological concepts, methods and theories.

SOC 204 Sociology of Family 3.
Contemporary American family structures and processes and their development. Focus on socialization, mate selection, marital adjustment and dissolution. Includes core sociological concepts, methods, theories.
SOC 205 Jobs and Work 3.
Work experience in terms of intrinsic and extrinsic rewards for worker. Work experience as intersection of occupation, industry, organization, region, and time period. Research skills for comparing job options to individual goals. Includes core sociological theories, concepts and methods.

SOC 206 Social Deviance 3.
Social processes in the creation and maintenance of deviant populations: classification, objectification of social meanings, functions of subcultures and social outcomes of the deviance-ascertainment process. Includes core sociological concepts, methods, theories.

SOC 220 Cultural Geography 3.
Investigates the world's past and present cultural diversity by studying spatial patterns of population, language, religion, material and non-material culture, technology and livelihoods, communities and settlements and political organization and interaction.

SOC 241 Sociology of Agriculture and Rural Society 3.
Application of sociological concepts, methods, theories and styles of reasoning to major social problems facing rural America. Changing structure of agriculture; social impact of agricultural technology; rural community growth and decline; rural industrialization, rural poverty, natural resources and environmental issues in rural America. Includes core sociological concepts, methods, theories.

SOC 241A Sociology of Agriculture and Rural Society 3.
Application of sociological concepts, methods, theories and styles of reasoning to major social problems facing rural America. Changing structure of agriculture; social impact of agricultural technology; rural community growth and decline; rural industrialization, rural poverty, natural resources and environmental issues in rural America. Includes core sociological concepts, methods, theories.

SOC 261 Technology in Society and Culture 3.
Processes of social and cultural change with a focus on role of technological innovation. Cross-cultural emphasis. Workplace changes and societal risks in U.S. and non-U.S. societies associated with technological innovations. Special attention to the role of scientists and engineers in socio-cultural change. Topical case studies apply core concepts and principles. Core sociological and anthropological concepts, methods, theories.

SOC 295 Special Topics in Sociology 1-3.
Offered as needed to present 200-level subject materials not normally available in regular course offerings or for new courses on a trial basis.

SOC 300 Social Research Methods 4.
Prerequisite: SOC 202, Corequisite: ST 311.
Basic methods of social research, research design, sampling, data collection, measurement, and analysis; the relationship between theory and research. Laboratory exercises on computer applications.

SOC 301 Human Behavior 3.
Prerequisite: 3 cr. in SOC, 200 level.
The development of personality as a consequence of social interactions and behavior of individuals in social contexts. Processes of learning, socialization, social perception, organization, stability and change of attitudes, norms, norm-formation and conformity, social roles and role strain, interpersonal attraction, and intergroup and intragroup relations.

SOC 304 Women and Men in Society 3.
Prerequisite: 3 cr. in SOC, 200 level.

SOC 305 Racial and Ethnic Relations 3.
Prerequisite: 3 cr. in SOC, 200 level.
Study of the nature of the relationships among racial and ethnic groups in societies around the world but with emphasis on the United States. Explores topics such as inequalities of wealth, power, and status, racism, conflict, and social boundaries among groups. Current trends in intergroup relations are discussed.

SOC 306 Criminology 3.
Prerequisite: 3 cr. in SOC, 200 level.
Study of processes whereby behavior is defined as crime and persons are identified as criminals. Includes a sociological investigation of agencies of law enforcement, adjudication, corrections and prevention; patterns of criminal behavior; explanations of variations in criminality with emphasis on sociocultural and sociopsychological theories.

SOC 309 Religion and Society 3.
Prerequisite: 3 cr. in SOC, 200 level.
Religious beliefs, practices and organizations addressed as social phenomena. Structural functionalism, conflict and subjectivism as theoretical orientations for understanding influences between religion and society. Relationship of religions to family, government, and economy and to social divisions, conflict and change.

SOC 311 Community Relationships 3.
Prerequisite: 3 cr. in SOC, 200 level.
Institutions, organizations and agencies found in modern communities; social problems and conditions with which they deal; their interrelationships and trends toward comprehensive planning.

SOC 342 International Development 3.
Prerequisite: 3 cr. in SOC, 200 level.
Sociological explanations of the causes of development and underdevelopment and origins of the present world system with emphasis on lesser developed countries. Recent global changes in the world situation including the increasing internationalization and interdependence of all countries.

SOC 350 Food and Society 3.
Prerequisite: 3 credits of a 200-level Sociology.
Relationships among individuals, groups, and organizations in the production, consumption, and distribution of food. Influences of gender, class, race, and ethnicity. Impacts of laws and regulations, markets, and social movements.

SOC 351 Population and Planning 3.
Prerequisite: 3 credits in SOC at the 200 level.
SOC 381 Sociology of Medicine 3.
Prerequisite: 200 level Sociology.
Use of theory and empirical studies to understand the social etiology of disease health practices, practitioners, and institutions, and the special area of mental health. Historical as well as contemporary examples of social influences on, and effects of, health throughout the world, but especially in the United States. Core sociological concepts, methods, theories.

SOC 395 Special Topics in Sociology 1-3.
Prerequisite: 3 credits of a 200-level Sociology. Offered as needed to present 300-level subject materials not normally available in regular course offerings or for new courses on a trial basis.

SOC 400 Theories of Social Structure 3.
Prerequisite: 3 cr. in SOC, 200 level.
Contributions of Durkheim, Marx, Weber and others to contemporary macro-level sociological theories. Origins and development of functionalist and conflict approaches. Theories of social solidarity, class structure, the state, bureaucratization, ideology. Uses of original works.

SOC 401 Theories of Social Interaction 3.
Prerequisite: 3 cr. in SOC, 200 level.
Contributions of Weber, Simmel, Mead, Homans, Goffman and others to contemporary micro-level sociological theories. Origins and development of symbolic interaction, ethnomethodology, exchange theory and dramaturgy. Theories of the self, social construction of reality, emotions, interpersonal relationships. Interrelationship of theory and research; use of original works.

SOC 402 Urban Sociology 3.
Prerequisite: SOC 300.
Urban social structures emphasizing determinants and consequences of changes in urban places and life styles. Current urban problems and various approaches to urban social planning.

SOC 404 Families and Work 3.
Prerequisite: SOC 200 level, SOC 300.
Sociological analysis of the interplay between economy and family. How men and women make decisions regarding work and family. Theory and research techniques appropriate to the student of work/family conflicts.

SOC 405 Racism in the U.S. 3.
Prerequisite: SOC 300.
The course will examine the nature of racism in American society and its correlates: prejudice, discrimination, racial conflict, and racial oppression. Emphasis on the history and development of racism in the U.S. as well as its impact on minority groups. Sociological explanations for the emergence and continuation of racism.

SOC 407 Sociology of Sexuality 3.
Prerequisite: 3 hours SOC 200 level, 300 level.

SOC 410 Sociology of Organizations 3.
Prerequisite: 3 cr. in SOC, 200 level, SOC 300.
Application of sociological theories to study of organizational structures and processes. Special attention to control and coordination, relations with other organizations, and decision making.

SOC 413 Criminal Justice Field Work 4.
Prerequisite: SOC 306 and PS 305, Senior standing in Criminal Justice option.
Supervised observation and experience in a criminal justice agency. Study of relationships between ongoing programs and relevant political and sociological theory and research. Weekly seminars, small groups and individual conferences. Presentation of an integrative report.

SOC 414 Social Class 3.
Prerequisite: SOC 300.
The universality of social inequality, its bases and consequences. Relationship of social inequality to social class, life chances, life styles and social mobility. Theories and research methods pertinent to the study of social class.

SOC 418 Sociology of Education 3.
Prerequisite: SOC 300.

SOC 425 Juvenile Delinquency 3.
Prerequisite: 3 cr. in SOC 200-level; SOC 300.

SOC 427 Sociology of Law 3.
Prerequisite: 3 cr. in SOC 200-level; SOC 300.
Sociological concepts, theories and research of law as social control. Social forces behind the creation, maintenance and application of law in American Society.

SOC 428 Formal Institutions of Social Control 3.
Prerequisite: 3 hours SOC 200 level; SOC 300.
Development, structure and behavior of formal institutions of social control in the United States (police, courts, corrections); divergent philosophies of punishment that guide the juvenile and adult criminal justice system, dimensions of inequality that influence processing decisions and effectiveness of formal institutions in controlling violations of legal norms.

SOC 429 Quantitative Data Analysis in Sociology 3.
Prerequisite: SOC 300 or ST 311 or equivalent.
Analysis of quantitative data in sociology, including relationship between theory and research, operationalization and measurement of concepts, descriptive and inferential statistics using computer statistical software, interpreting statistical findings and writing research papers. Sociology and Criminology majors or consent of the instructor.

SOC 430 Community and Crime 3.
Prerequisite: 3 credits in SOC 200 level; SOC 300.
Neighborhood development, structure and processes as related to delinquency, crime and criminality. Divergent theories of the effect of neighborhood context on crime and crime on neighborhood processes. The interaction of person and neighborhood context. Implications of community processes for social control.
SOC 432 Violence, Terrorism, and Public Policy 3.
Prerequisite: SOC 300 or PS 371.
The course examines interpersonal and group violence in contemporary societies and the causes for its occurrences. Specific forms of violence that will be examined include domestic violence, gangs, homicide, and terrorism, domestically and internationally. Throughout the course students will use data to critically evaluate policies and practices to prevent and control violence and will examine potential solutions to the problems of violence.

SOC 440 Social Change 3.
Prerequisite: 3 cr. in SOC, 200 level; SOC 300.
Sources, processes and consequences of social change on macro and micro levels. Applications of classical and contemporary theories to historical and modern examples of social change in international, national, regional, community, and institutional settings. Examples of empirical studies and appropriate methodologies for each level of analysis.

SOC 445 Inequality, Ideology, and Social Justice 3.
Prerequisite: 3 hours of 200-level SOC and SOC 300.
Systematically addresses the question of why people believe what they do about the legitimacy of inequality; explores the role of self-interest, secular and religious values, considers specific types of ideology such as meritocracy, racism, sexism, colonialism; applies various theories to explain patterns of belief; looks at the role of media and propaganda in shaping beliefs.

SOC 450 Environmental Sociology 3.
Prerequisite: 3 hours of 200-level SOC and SOC 300.

SOC 457 Corporate Power in America 3.
Prerequisite: (SOC 202 or SOC 203) and SOC 300.
Examines the nature, distribution, and exercise of power in U.S. society. Emphasizes corporate power and its relationship to government. Topics include membership in the upper class and the power elite, media and shaping of public opinion, the culture of politics, formation of political consciousness, and the emergence of oppositional and reactionary social movements.

SOC 465 Social Aspects of Mental Health 3.
Prerequisite: SOC 300.
A survey of the role of social environment and life experiences in mental health and mental disorder, focusing on the link between social inequality and emotional inequality. Topics include the social construction of mental illness and the classification process, social distribution of mental health, explanations of mental health differences. Special emphasis on adolescent and adult traumas that shape the life course.

SOC 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in sociological research that utilizes facilities and resources which are external to the campus. Students are placed with organizations to apply sociological concepts in planning or conducting a research project. Contact the Sociology & Anthropology undergraduate coordinator to obtain department approval.

SOC 493 Special Problems in Sociology 1-6.
Prerequisite: Sophomore standing.
A learning experience in sociological research that utilizes campus facilities and resources. Arrangements must be initiated by the student and approved by the instructor prior to the experience. Contact the Sociology & Anthropology undergraduate coordinator to obtain department approval.

SOC 495 Special Topics in Sociology 1-3.
Offered as needed to present materials not normally available in regular course offerings or for new courses on a trial basis.

SOC 498 Independent Study in Sociology 1-6.
Prerequisite: Six hours SOC above the 200 level.
A detailed investigation of a topic in sociology. Topic and mode of study determined by the faculty member(s) in consultation with the department head. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

SOC 508 Social Organization 3.
Prerequisite: SOC 400 or SOC 701.
Introduction to study of social structure. Focus on inequality, work, organizations, the economy, the state. Classic writings and their impacts.

SOC 509 Population Problems 3.
Prerequisite: SOC 202.
Examination of population growth, rates of change and distribution. Emphasis on functional roles of population, i.e., age, sex, race, residence, occupation, marital status and education. Stress on population dynamics fertility, mortality and migration. Analysis on population policy in relation to national and international goals stressing a world view.

SOC 514 Developing Societies 3
Prerequisite: Six hrs. SOC or ANT or Graduate standing or PBS status.
Definition of major problems posed for development sociology and exploration of social barriers and theoretical solutions for development set forth with regard to newly developing countries. Review of significant past strategies and presentation of main themes in current development schemes. Proposal and discussion of untested strategies for the future. Examination of these problems in their national and international contexts.

SOC 533 The Community 3.
Prerequisite: Six hrs. SOC.
The community viewed in sociological perspective as a functioning entity. Presentation and application of a method of analysis to eight "dimensions," with emphasis on the unique types of understanding to be derived from measuring each dimension. Finally, analysis of effect of change on community integration and development.

SOC 591 Special Topics In Sociology 1-6.
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

SOC 601 Seminar 1-3.
Appraisal of current literature; presentation of research papers by students; progress reports on departmental research; review of developing research methods and plans; reports from scientific meetings and conferences; other professional matters. Credits Arranged.

SOC 610 Special Topics In Sociology 1-6.
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.
SOC 642 Practicum In Sociology 1-6.
Prerequisite: Graduate standing in the Master of Sociology program and nine hrs. of SOC at the 500-600 level.
Opportunity for student under supervision of graduate advisory committee chair and organization/agency supervisor to develop and demonstrate competency in the area of graduate specialization through application of sociological knowledge to practical problems facing the organization/agency.

SOC 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

SOC 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam. Credits Arranged.

SOC 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

SOC 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged.

SOC 701 Classical Sociological Theory 3.
Prerequisite: Six hrs. SOC and Graduate standing or PBS status.
The interdependence of theory and research in sociology; major theoretical classics in the discipline and how they provide foundations for subsequent developments and for analysis in substantive areas.

SOC 702 Contemporary Sociological Theory 3.
Prerequisite: SOC 701.
Works by major figures representing leading schools of sociological theory in the post-World War II period studied as primary sources. Underlying assumptions made explicit, the structure of the theory, including propositions, examined critically and discussion of relationships with other theoretical perspectives.

SOC 707 Quantitative Sociological Analysis 3.
Prerequisite: ST 507.
Introduction to application of common quantitative methodologies in sociology including multiple regression and path analysis. Emphasis on selecting appropriate analytical techniques, model estimation and sociological interpretation of findings.

SOC 708 Advanced Sociological Analysis 3.
Prerequisite: SOC 711, ST 507 or ST 711.
Examination of advanced analysis techniques adaptable to needs of sociological research. Special attention given to causal analysis, analysis of change and aggregate versus individual level data analyses. Consideration of sociological examples. Attention to emerging issues and techniques.

SOC 710 Teaching Sociology 3.
Prerequisite: Admission to sociology graduate program.
The objective of this course is for students to further their skills in teaching sociology. Students will plan an undergraduate course, construct a teaching philosophy, evaluate a variety of teaching techniques, and demonstrate an understanding of teaching as a sociological phenomenon.

SOC 711 Research Methods In Sociology I 3.
Prerequisite: SOC 300, ST 311.
Issues in philosophy of science, causation, relationship of theory and research. Qualitative, experimental and survey design methodologies.

SOC 712 Advanced Survey Research Methods 3.
Prerequisite: SOC 711 and SOC 707.
Advanced survey methodology including research design, sampling, questionnaire development and surveys using the World Wide Web. Designing and executing substantive and methodological studies using surveys to operationalize behavioral and social constructs and to test hypotheses.

SOC 713 Applied Research 3.
Prerequisite: SOC 202.
Studies research process with emphasis upon its application to action problems. Stress upon development of research design to meet action research needs.

SOC 715 Qualitative Sociological Methods and Analysis 3.
Prerequisite: Graduate standing.
Survey of qualitative sociological research methods. Practice in research design and evaluation, multiple forms of data gathering and data analysis. Theoretical and epistemological issues as related to qualitative sociology, with special attention to ritual and feminist epistemological debates.

SOC 721 Deviant Behavior 3.
Prerequisite: Six hrs. SOC or ANT or Graduate standing or PBS status.
Topics include: the inevitability of deviance and its social utility; cross-cultural variations in appearance and behavioral cues for labeling the deviant; descriptive and explanatory approaches to kinds and amounts of deviance in contemporary American society; social change, anomic and social disorganization theories; the process of stigmatization; formal and informal social responses to deviance and the deviant; social action implications.

SOC 722 Social Control 3.
Prerequisite: Six hrs. SOC above 200 level or Graduate standing or PBS status.
Examination of need, functions, utilization and effects of both informal and formal social control mechanisms. Emphasis and critical evaluation of theoretical perspectives on social control and the empirical support for these positions.
SOC 723 Research On Crime and Deviance 3.
Prerequisite: SOC 721.
Major topics including an examination of conceptual problems and research issues and methods in study of crime and deviance; an assessment of current research on crime causation and deviance processes; an examination of research on social control processes and agencies; and an assessment of social action and evaluative research. A variety of substantive topics dealt with in the context of above topical areas including: delinquency, drug usage, mental illness, obesity, stuttering, suicide, prostitution, homicide and rape.

SOC 727 Comparative Societies 3.
Prerequisite: Six hrs. SOC.
Sociological analysis of societies around the world with particular reference to North and South America. Special emphasis given to cultural and physical setting, population composition, levels of living, relationship of the people to the land, structure and function of major institutions and forces making for change.

SOC 731 Survey Of Family Sociology 3.
Prerequisite: SOC 202.
Examination of structural and demographic continuities and changes for American families in general and within major subgroups (e.g., race, ethnicity, social class). Consideration of historical and cross-cultural comparisons. Assessment of the impact of families upon their members and the dynamics of marital and family relationships.

SOC 732 Contemporary Family Theory and Research 3.
Prerequisite: SOC 731.
Emphasis on contemporary research, theory and methodological techniques used by sociologists studying families. Critical examination of where field is now and where it appears to be heading. Primarily for graduate students designing or doing research about families.

SOC 736 Social Stratification 3.
Prerequisite: Six hrs. SOC.
The theoretical background, methodological approaches and analysis of the consequences of systems of stratification. Emphasis on static and dynamic qualities of stratification systems on relations within and between societies. Attention to the integrative and divisive quality of stratification as expressed in life styles, world views, etc.

SOC 737 Sociology Of Gender 3.
Prerequisite: Graduate student, SOC 736 OR 731.
Theories about the development and maintenance of gender. Historical development of gender stratification. How individuals “do gender” in their daily lives. Contemporary research and substantive readings about gender in public and intimate relationships.

SOC 738 Race and Ethnic Inequality 3.
Prerequisite: Six hours of Sociology.
Theoretical and methodological approaches and critical debates on race. Impact of racial discrimination on inequality. Effects of inequality on community institutions. Formation of attitudes and identities.

SOC 739 Social Psychology Of Inequality 3.
Prerequisite: SOC 746 or 508.
The effects of race, class and gender inequality on the formation of group consciousness, self-evaluations, emotions, values, attitudes and beliefs. Attention to interpersonal processes through to reproduction of inequality in everyday life.

SOC 746 Sociological Social Psychology 3.
Prerequisite: SOC 401t.
Central issues in sociological social psychology, including formation of the self, effects of social structure on individual development, emergence of ritualized interaction and tension between individual agency and societal constraint. Emphasis on symbolic interactionist and dramaturgical perspectives.

SOC 752 Work and Industry 3.
Prerequisite: SOC 400 or SOC 508 or SOC 701.
Control of economy and workplace. Special attention to economic restructuring, the labor process and recent workplace innovations. Theories include managerialism, bank hegemony and deskilling. Historical studies complement analyses of contemporary settings and issues.

SOC 753 Inequality in Work and the Economy 3.
Prerequisite: SOC 701.
Sociological study of structural inequality in labor markets and workplaces with implications for class, race, gender, and spatial disparities in employment-related outcomes. Special attention is paid to job quality, spatial disparities in employment opportunity, and processes contributing to race and gender disparities in job attainment and rewards.

SOC 754 Economic Sociology 3.
Prerequisite: SOC 701.
Embeddedness of economic action by individuals, firms, and states within a social context. Topics include globalization, restructuring, the informal economy, social capital, spatial organization, labor markets and role of the state.

SOC 791 Special Topics In Sociology 1-6.
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

SOC 810 Special Topics In Sociology 1-6.
An examination of current problems organized on a lecture-discussion basis. Course content varies as changing conditions require new approaches to emerging problems.

SOC 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

SOC 890 Doctoral Preliminary Exam 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

SOC 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.
For students who have completed all credit hour requirements, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

**Soil Science (SSC)**

**SSC - Soil Science Courses**

**SSC 103 Introductory Topics in Crop, Soil and Turfgrass Sciences**
Introduction to the scope, purpose, and objectives of a university education with an emphasis on areas related to Crop, Soil and Turfgrass Sciences. Students will explore university, college and departmental resources, academic policies and procedures, opportunities for minors, career opportunities, and current trends and issues in our related disciplines. Students cannot receive credit for both CS 103 and ALS 103. Freshman Only; PAA, PAB, PAC, PAE, PCB, SST, TFG.

**SSC 112 Principles of Soil Science**
Fundamental soil physical and chemical properties and principles. Major lecture topics: soil description, formation, soil water and the hydrologic cycle, and soil fertility and fertilizers. Laboratory exercises in identifying soil horizons, determining soil texture, identifying nutrient deficiency symptoms in plants and interpreting soil fertility test reports. BROOME.

**SSC 151 Fertilizers and Soil Fertility**
Principles of managing plant nutrients in soils for crop, turfgrass and other plant production; nutrient requirements; deficiency symptoms, nutrient availability in soils; soil acidity and liming; fertilizer materials; organic fertilizers; and environmental effects of fertilizers. BROOME.

**SSC 185 Land and Life**
Soil is a fundamental natural resource that sustains life on earth. Detailed information is provided about soils at local, community, regional, national, and global scales; and their importance to world food security and human health, agricultural production, environmental quality, and sustainable ecosystems. Students will gain practical knowledge about soils, their use and management, and their critical role in supporting life. Understanding basic soil properties, their interactions, and how they are influenced or impacted by human activity is essential to everyday life and to being a well-informed citizen.

**SSC 200 Soil Science**
Prerequisite: CH 101 or CH 100. Fundamentals of soils including origin, composition and classification; their physical, chemical, and biological properties; significance of these properties to soil-plant relationships and soil management.

**SSC 201 Soil Science Laboratory**
Corequisite: SSC 200. Hands-on laboratory experience in fundamentals of soils including origin, composition and classification; their physical, chemical, and biological properties; significance of these properties to soil-plant relationships, soil management and the environment.

**SSC 322 Environmental Soil Microbiology**
Prerequisite: BIO 181 and SSC 200. Analysis of the effects of soil environments on microbial growth. Relationships and significance of microbes to mineral transformations, plant development, and environmental quality. Management of soil microorganisms in different ecosystems.

**SSC 341 Soil Fertility and Fertilizers**
Prerequisite: SSC 200. Principles of managing plant nutrition for crop production, fertilizer materials, crop fertilization, soil fertility maintenance and management practices for optimizing fertilizer use; soil and plant tissue testing as diagnostic tools in nutrient management.

**SSC 342 Soil Fertility Laboratory**
Corequisite: SSC 341. Soil sampling and analyses for acidity and nutrient content. Calculating lime and fertilizer recommendations and calibrating fertilizer spreaders. Discussion of fertilizer materials and calculation of least cost blends. Computer programs to confirm recommendations and least cost blends. Field trip to a fertilizer distributor and to a fertilizer user.

**SSC 421 Role of Soils in Environmental Management**
Prerequisite: SSC 200. Importance of soils in land application of municipal, industrial and agricultural wastes; onsite disposal of domestic wastewater; bioremediation of contaminated sites; erosion and sedimentation control; farm nutrient management; and nonpoint source water pollution.

**SSC 427 Biological Approaches to Sustainable Soil Systems**
Prerequisite: SSC 200 or equivalent, BIO 181 or 183, and CH 101. Ecological and biochemical concepts will be applied to managing soils in agro-ecological settings such as organic and conventionally managed farms and gardens, emphasizing microbial transformations of nutrients and matter. Topics covered include soil organic matter formation and fractionation, decomposition, microbial assimilation of nutrients, fertilizer management, tillage, crop rotations, cover crop management. Companion course SSC 428 and SSC 341 recommended.

**SSC 428 Service-Learning in Urban Agriculture Systems**
Prerequisite: SSC 200 or equivalent, BIO 181 or 183, and CH 101. Course provides students a hands-on experience in urban agriculture with under-served youth in the Raleigh area. Students partner with a community gardening organization to provide knowledge and experience in soil science and agriculture to youth with the goals of increasing urban food security and developing student leadership skills. Particular emphasis is placed on reflecting on course activities and deepening of skills related to extension, outreach, and working with diverse populations. Course designed to be taken as a companion course to SSC 427, however can be taken as a stand-alone course.

**SSC 440 Geographic Information Systems (GIS) in Soil Science and Agriculture**
Prerequisite: SSC 200. Geographic information systems (GIS), global positioning system (GPS), and remote sensing to manage spatially variable soils, vegetation, other natural resources. Develop: function understanding of GIS principles, working knowledge of ArcGIS, problem-solving/critical-thinking necessary to use GIS to characterize and manage soils, agriculture, natural resources. Introduction to GIS; Maps/Cartography; Vector/Raster Data Models; Georeferencing/Coordinate Systems; Spatial Data Sources; GPS/GPS skills/ Remote Sensing; Statistics/Interpolation; Precision Agriculture; Computer Aided Design and GIS; Creating Analyzing 3-D Surfaces. Credit not given for both SSC 440 and SSC 540.

**SSC 442 Soil and Environmental Biogeochemistry**
Prerequisite: SSC 200 and (CH 101, or CH 201, or CH 220, or CH 221). Quantitative approaches to the cycling of elements and chemical species in soils and the environment, including carbon and organic contaminants, non-metallic macronutrients, metals and metalloids.
SSC 452 Soil Classification 4.
Prerequisite: SSC 200.
Genesis, morphology, and classification of soils; characterization of soils according to their diagnostic properties; interpreting soil use potential; emphasis on North Carolina soils and their taxonomy; field exercise in soil mapping and site evaluation; several field trips, one overnight.

SSC 455 Soils, Environmental Quality and Global Challenges 3.
P: SSC 200 or ES 100 or Instructor permission.
As the world population grows to 9 billion people by 2050, we will be pressed to increase food security, respond to the consequences of a changing climate, and improve human health -- all while protecting the environment and maintaining natural resources. Soils play a critical role in many of these challenges. The goal of this course is to teach students how soils regulate environmental quality through a host of chemical, physical, and biological processes. We will examine a series of global challenges, assess their related environmental issues and policies, and analyse the roles of soils in each issue.

SSC 461 Soil Physical Properties and Plant Growth 3.
Prerequisite: SSC 200.
Soil physical properties and their influence on plant growth and environmentally sound land use; soil solid-porosity-density relationships, soil water, heat and air relations and transport. Principles and applications of these topics using current literature in agronomy, turf, horticulture, water quality, waste management and urban land use.

SSC 462 Soil-Crop Management Systems 3.
Prerequisite: CS 213, CS 414, SSC 342, SSC 452; senior standing.
Unites principles of soil science and crop science with those of allied areas into realistic agronomic applications; practical studies in planning and evaluation of soil and crop management systems.

SSC 470 Wetland Soils 3.
Prerequisite: SSC 200, SSC 452 recommended.
Wetland definitions, concepts, functions and regulations; chemical, physical and morphological characteristics of wetland soils. Wetland soil identification using field indicators and monitoring equipment; principles of wetland creation, restoration and mitigation. Special project required for SSC 570. Two mandatory field trips. Field trips for distance education students are not required but optional. Credit will not be given for both SSC 470 and SSC 570.

SSC 490 Senior Seminar in Crop Science and Soil Science 1.
Prerequisite: Senior standing in Agronomy, Plant and Soil Sciences, or Turfgrass Science.
Review and discussion of current topics in crop science, soil science, agronomy and natural resource management. Preparation and presentation of scientific information in written and oral format. Senior standing in Agronomy, Plant and Soil Sciences, or Turfgrass Science.

SSC 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with the prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator and the academic dean prior to the experience.

SSC 493 Special Problems in Soil Science 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator prior to the experience.

SSC 495 Special Topics in Soil Science 1-6.
Prerequisite: SSC 200.
Offered as needed to present materials not normally available in regular course offerings or for offering of new courses on a trial basis.

SSC 511 Soil Physics 4.
Prerequisite: SSC 200, PY 212.
Soil physical properties and theory of selected instrumentation to measure them. Topics including soil solids, soil water, air and heat. Emphasis on transport processes and the energy concept of soil and water.

SSC 521 Soil Chemistry 3.
Prerequisite: SSC 200, one yr. of general inorganic chemistry.
A consideration of the chemical and colloidal properties of clay and soil systems, including ion exchange and retention, soil solution reactions, solvation of clays and electrokinetic properties of clay-water systems.

SSC 522 Soil Microbiology 4.
Prerequisite: MB 351; CH 220.
Soil as a medium for microbial growth, the relation of microbes to important mineral transformations in soil, the importance of biological equilibrium and significance of soil microbes to environmental quality.

Prerequisite: SSC 200.
Geographic information systems (GIS), global positioning system (GPS), and remote sensing to manage spatially variable soils, vegetation, other natural resources. Develop: function understanding of GIS principles, working knowledge of ArcGIS, problem-solving/critical-thinking necessary to use GIS to characterize and manage soils, agriculture, natural resources. Introduction to GIS; Maps/Cartography; Vector/Raster Data Models; Georeferencing/Coordinate Systems; Spatial Data Sources; GPS/GPS skills/ Remote Sensing; Statistics/Interpolation; Precision Agriculture; Computer Aided Design and GIS; Creating Analyzing 3-D Surfaces. Credit not given for both SSC 440 and SSC 540.

SSC 541 Soil Fertility 3.
Prerequisite: SSC 341.
Soil conditions affecting plant growth and the chemistry of soil and fertilizer interrelationships. Factors affecting the availability of nutrients. Methods of measuring nutrient availability.

SSC 545 Remote Sensing Applications in Soil Science and Agriculture 3.
Prerequisite: SSC 200, PY 212.
Overview of remote sensing including history, evolution, vocabulary, and physical principles, i.e., electromagnetic radiation and its interaction with matter. Distant and proximate remote sensing techniques (aerial photography, satellite imaging, radar, lidar, etc.), hardware, and platforms and their application in the characterization and management of soils and crops. Development of strategies for incorporating remote sensing into soil and agronomic research, and of practical skills for processing, analysis, display, and discussion of remote sensing data with applications in soil science and agriculture.
SSC 551 Soil Morphology, Genesis and Classification 3.
Prerequisite: SSC 200.
Morphology: Chemical, physical and mineralogical parameters useful
Classification: historical development and present concepts of soil
taxonomy with particular reference to worldwide distribution of great soil
groups as well as discussions of logical bases of soil classification.

SSC 562 Environmental Applications Of Soil Science 3.
Prerequisite: SSC 200.
Identification and evaluation of basic factors influencing movement of
potential pollutants through soil and their underlying strata. Development of
understanding of processes of soil and site evaluation for waste
disposal and transport of pollutants through soils.

SSC 570 Wetland Soils 3.
Prerequisite: SSC 200, SSC 452 recommended.
Wetland definitions, concepts, functions and regulations; chemical,
physical and morphological characteristics of wetland soils. Wetland soil
identification using field indicators and monitoring equipment; principles
of wetland creation, restoration and mitigation. Special project required for
SSC 570. Two mandatory field trips. Field trips for distance education
students are not required but optional. Credit will not be given for both
SSC 470 and SSC 570.

SSC 573 Introduction to Surface Hydrologic/Water Quality Modeling
3.
Prerequisite: BAE 471, SSC 200.
Concepts in basic hydrologic, erosion and chemical transport used
in modeling. Evaluation of typical hydrologic/water quality models on
watershed systems. Usage of state-of-the-art models in project examples.

SSC 590 Special Problems 1-6.
Prerequisite: SSC 200.
Special problems in various phases of soils. Emphasis placed on review
of recent and current research. Credits Arranged.

SSC 601 Seminar 1.
Prerequisite: Graduate standing in SSC.
A maximum of two semester hours allowed toward the master's degree,
but any number toward the doctorate. Scientific articles, progress reports
in research and special problems of interest to soil scientists reviewed and
discussed.

SSC 609 Colloquium In Soil Science 1-3.
Prerequisite: Graduate standing in SSC.
Seminar-type discussions and lectures on specialized and advanced
topics in soil science. Credits Arranged.

SSC 620 Special Problems 1-6.
Prerequisite: SSC 200.
Special problems in various phases of soils. Emphasis placed on review
of recent and current research. Credits Arranged.

SSC 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the
student in planning for the teaching assignment, observe and provide
feedback to the student during the teaching assignment and evaluate the
student upon completion of the assignment.

SSC 688 Non-Thesis Masters Continuous Registration - Half Time
Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all
credit hour requirements for their degree but need to maintain half-time
continuous registration to complete incomplete grades, projects, final
master's exam, etc.

SSC 689 Non-Thesis Master Continuous Registration - Full Time
Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all
credit hour requirements for their degree but need to maintain full-time
continuous registration to complete incomplete grades, projects, final
master's exam, etc. Students may register for this course a maximum of
one semester.

SSC 690 Master's Exam 1-9.
Prerequisite: Master's student.
For students who have completed all credit hour requirements for their degree except preparing for and taking the final
master's exam. Credits Arranged.

SSC 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member
of the Graduate Faculty.

SSC 695 Master's Thesis Research 1-9.
Prerequisite: Master's student.
Thesis Research.

SSC 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course
work during a summer session and who will be devoting full time to thesis
research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-
time enrollment for the master's degree and are writing and defending
their thesis. Credits arranged.

SSC 720 Soil and Plant Analysis 3.
Prerequisite: PY 212; CH 315; at least three soils courses including
SSC 341.
Theory and advanced principles of utilization of chemical instruments to
aid research on the heterogeneous systems of soils and plants.

SSC 722 Advanced Soil Chemistry 3.
Prerequisite: SSC 521, CH 730.
Critical review of application of chemical thermodynamics and kinetics
to under standing soil systems, solution equilibria, precipitation and
dissolution, complexation, reduction-oxidation, surface-solute interactions
and chemical transport. Application of chemical speciation models.

SSC 725 Pesticide Chemistry 1.
Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225).
Chemical properties of pesticides including hydration and solvation,
ionization, volatilization, lipophilicity, molecular structure and size, and
reactivity and classification according to chemical description, mode of
action or ionizability. Taught during the first 5 weeks of semester. Drop
date is last day of 3rd week of the minicourse.
SSC 727 Pesticide Behavior and Fate In the Environment. 2.
Prerequisite: CS(HS, SSC, TOX) 725, SSC 200.
Sorption/desorption, soil reactivity, movement, volatilization, bioavailability, degradation and stability of pesticides in the environment. Taught during the last 10 weeks of semester. Drop date is last day of 3rd week of the minicourse.

SSC 753 Soil Mineralogy. 3.
Prerequisite: SSC 200, SSC 341.
Composition, structure, classification, identification, origin, occurrence and significance of soil minerals with emphasis on primary weatherable silicates, layer silicate clays and sesquioxides.

SSC 771 Theory Of Drainage—Saturated Flow. 3.
Discussion of physical concepts and properties of fluids and porous media in relation to soil-water movement. Derivation and discussion of the fundamental laws and equations governing saturated flow in porous media. Analysis of mathematical solutions of steady-state and transient flow equations to determine their applicability to drainage problems. Consideration of analogs and models of particular drainage problems.

SSC 790 Special Topics 1-6.

SSC 801 Seminar 1.

SSC 809 Colloquium In Soil Science 1-3.
Prerequisite: Graduate standing in SSC.
Seminar-type discussions and lectures on specialized and advanced topics in soil science. Credits Arranged.

SSC 820 Special Problems 1-6.
Prerequisite: SSC 200.
Special problems in various phases of soils. Emphasis placed on review of recent and current research. Credits Arranged.

SSC 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

SSC 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

SSC 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination and residency requirements for the doctoral degree and are writing and defending their dissertations.

Specialized Veterinary Medicine (SVM)

SVM - Specialized Veterinary Medicine Courses

SVM 510 Animal Production Topics 1-3.
Students will be provided with experience in management of production animals with an emphasis on the veterinary aspects of population health. Experience will come in the form of hands-on experiences and working through relevant literature to specific and relevant population health issues.

SVM 579 Advanced Specialty Training 1-3.
This course is designed to give students clinical experience and training to understand basic health management strategies, handle clinical evaluations, use diagnostic tools to facilitate accurate diagnosis, and develop prevention and/or treatment plans for health management. This course is restricted to Students in the SVM program.

SVM 595 Special Topics 1-6.

SVM 601 Seminar 1-3.

SVM 602 Seminar - Poultry Medicine 1-3.

SVM 603 Seminar - Small Animal Surgery 1-3.

SVM 610 Special Topics 1-6.

SVM 615 Advanced Animal Production Topics 1-3.
Prerequisite: SVM 510.
Students will be provided with practice and experience in advanced topics related to management of production animals with an emphasis on the veterinary aspects of population health. Actual in-the-field, hands-on practice and investigation of relevant literature will provide the basis for study of advanced animal production topics. Course is restricted to students in the SVM program.

SVM 635 Advanced Reading 1-3.

SVM 650 Internship - SVM 1-3.

SVM 685 Supervise Teaching 1-3.

SVM 686 Other Teaching 1-3.

SVM 693 Supervised Research 1-9.

Statistics (ST)

ST - Statistics Courses

ST 101 Statistics by Example 3.
Sampling, experimental design, tables and graphs, relationships among variables, probability, estimation, hypothesis testing. Real life examples from the social, physical and life sciences, the humanities and sports. Credit not allowed if student has prior credit for another ST course.
ST 114 Statistical Programming 3.
Restriction: Statistics majors only.
This is an introductory course in computer programming for statisticians using Python. Emphasis is on designing algorithms, problem solving, and forming good coding practices: methodical development of programs from specifications; documentation and style; appropriate use of control structures such as loops, of data types such as arrays; modular program organization; version control. Students will become acquainted with core statistical computational problems through examples and coding assignments, including computation of histograms, boxplots, quantiles, and least squares regression.

ST 305 Statistical Methods 4.
Prerequisites: MA 141 and (COS 100 or E 115); Corequisite: ST 307.

ST 307 Introduction to Statistical Programming- SAS 1.
Corequisite: ST 305 or ST 312 or ST 372.
An introduction to using the SAS statistical programming environment. The course will combine lecture and a virtual computing laboratory to teach students how to use the SAS system for: basic data input and manipulation; graphical displays of univariate and bivariate data; one- and two-sample analyses of means; simple linear regression; one-way ANOVA. Documentation of code and writing of statistical reports will be included.

ST 308 Introduction to Statistical Programming - R 1.
Introduction to the statistical programming language R. The course will cover: reading and manipulating data; use of common data structures (vectors, matrices, arrays, lists); basic graphical representations.

ST 311 Introduction to Statistics 3.
Examining relationships between two variables using graphical techniques, simple linear regression and correlation methods. Producing data using experiment design and sampling. Elementary probability and the basic notions of statistical inference including confidence interval estimation and tests of hypothesis. One and two sample t-tests, one-way analysis of variance, inference for count data and regression. Credit not allowed if student has prior credit for another ST course or BUS 350.

ST 312 Introduction to Statistics II 3.
Prerequisite: ST 311.
A further examination of statistics and data analysis. Inference for comparing multiple samples, experimental design, analysis of variance and post-hoc tests. Inference for correlation, simple regression, multiple regression, and curvilinear regression. Analysis of contingency tables and categorical data. No credit for students who have credit for ST 305.

Prerequisite: MA 114.
Introduction to statistics applied to management, accounting, and economic problems. Emphasis on statistical estimation, inference, simple and multiple regression, and analysis of variance. Use of computers to apply statistical methods to problems encountered in management and economics.

ST 361 Introduction to Statistics for Engineers 3.
Prerequisite: College algebra.
Statistical techniques useful to engineers and physical scientists. Includes elementary probability, frequency distributions, sampling variation, estimation of means and standard deviations, basic design of experiments, confidence intervals, significance tests, elementary least squares curve fitting. Credit not allowed for both ST 361 and ST 370 or ST 380.

ST 370 Probability and Statistics for Engineers 3.
Prerequisite: MA 241.
Calculus-based introduction to probability and statistics with emphasis on Monte Carlo simulation and graphical display of data on computer workstations. Statistical methods include point and interval estimation of population parameters and curve and surface fitting (regression analysis). The principles of experimental design and statistical process control are introduced. Credit not allowed for both ST 370 and ST 361 or ST 380.

ST 371 Introduction to Probability and Distribution Theory 3.
Prerequisite: MA 241, Corequisite: MA 242.
Basic concepts of probability and distribution theory for students in the physical sciences, computer science and engineering. Provides the background necessary to begin study of statistical estimation, inference, regression analysis, and analysis of variance.

ST 372 Introduction to Statistical Inference and Regression 3.
Prerequisite: ST 371.
Statistical inference and regression analysis including theory and applications. Point and interval estimation of population parameters. Hypothesis testing including use of t, chi-square and F. Simple linear regression and correlation. Introduction to multiple regression and one-way analysis of variance.

ST 380 Probability and Statistics for the Physical Sciences 3.
Prerequisite: MA 241.
Introduction to probability models and statistics with emphasis on Monte Carlo simulation and graphical display of data on computer laboratory workstations. Statistical methods include point and interval estimation of population parameters and curve and surface fitting (regression analysis). Credit not allowed for both ST 380 and ST 361 or ST 370.

ST 401 Experiences in Data Analysis 4.
Prerequisite: Permission of Instructor and either ST 311 or ST 305.
This course will allow students to see many practical aspects of data analysis. Each section of this course will expose students to the process of data analysis in a themed area such as biostatistics or environmental statistics. Students will see problems of data collection and analysis through a combination of classroom demonstrations, hands on computer activities and visits to local industries.

ST 412 Long-Term Actuarial Models 3.
Prerequisite: MA 241 or MA 231, Corequisite: MA 421, BUS(ST) 350, ST 301, ST 305, ST 311, ST 361, ST 370, ST 371, ST 380 or equivalent.
Long-term probability models for risk management systems. Theory and applications of compound interest, probability distributions of failure time random variables, present value models of future contingent cash flows, applications to insurance, health care, credit risk, environmental risk, consumer behavior and warranties.

ST 413 Short-Term Actuarial Models 3.
Prerequisite: MA 241 or MA 231, and one of MA 421, ST 301, ST 305, ST 370, ST 371, ST 380, ST 421.. Short-term probability models for risk management systems. Frequency distributions, loss distributions, the individual risk model, the collective risk model, stochastic process models of solvency requirements, applications to insurance and business decisions.
Prerequisite: MA 242.
First of a two-semester sequence of mathematical statistics, primarily for undergraduate majors and graduate minors in Statistics. Introduction to probability, univariate and multivariate probability distributions and their properties, distributions of functions of random variables, random samples and sampling distributions.

ST 422 Introduction to Mathematical Statistics II 3.
Prerequisite: ST 421.
Second of a two-semester sequence of mathematical statistics, primarily for undergraduate majors and graduate minors in Statistics. Random samples, point and interval estimators and their properties, methods of moments, maximum likelihood, tests of hypotheses, elements of nonparametric statistics and elements of general linear model theory.

ST 430 Introduction to Regression Analysis 3.
Prerequisites: (ST 305 or ST 312 or ST 372) and ST 307 and (MA 305 or MA 405).
Regression analysis as a flexible statistical problem solving methodology. Matrix review; variable selection; prediction; multicolinearity; model diagnostics; dummy variables; logistic and non-linear regression. Emphasizes use of computer.

ST 431 Introduction to Experimental Design 3.
Prerequisite: ST 302 or ST 305.
Experimental design as a method for organizing analysis procedures. Completely randomized, randomized block, factorial, nested, latin squares, split-plot and incomplete block designs. Response surface and covariance adjustment procedures. Stresses use of computer.

ST 432 Introduction to Survey Sampling 3.
Prerequisite: ST 302 or ST 305.
Design principles pertaining to planning and execution of a sample survey. Simple random, stratified random, systematic and one- and two-stage cluster sampling designs. Emphasis on statistical considerations in analysis of sample survey data. Class project on design and execution of an actual sample survey.

ST 435 Statistical Methods for Quality and Productivity Improvement 3.
Prerequisite: ST 302 or ST 305.
Use of statistics for quality control and productivity improvement. Control chart calculations and graphing, process control and specification; sampling plans; and reliability. Computer use will be stressed for performing calculations and graphing.

ST 445 Introduction to Statistical Computing and Data Management 3.
Corequisite: ST 302 or ST 305.
Use of computers to manage, process and analyze data. Concepts of research; data management; JCL and utility programs; use of statistical program package for data analyses and graph production; and writing statistical programs to perform simulation experiments. Major paper required.

ST 495 Special Topics in Statistics 1-6.
Offered as needed to present material not normally available in regular departmental course offerings, or for offering new courses on a trial basis.

ST 498 Independent Study In Statistics 1-6.
Prerequisite: Six hours of ST.
Detailed investigation of topics of particular interest to advanced undergraduates under faculty direction. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

ST 501 Fundamentals of Statistical Inference I 3.
Prerequisite: MA 242 or equivalent.
First of a two-semester sequence in probability and statistics taught at a calculus-based level. Probability: discrete and continuous distributions, expected values, transformations of random variables, sampling distributions. Credit not given for both ST 521 and ST 501.

ST 502 Fundamentals of Statistical Inference II 3.
Prerequisite: ST 501.
Second of a two-semester sequence in probability and statistics taught at a calculus-based level. Statistical inference: methods of construction and evaluation of estimators, hypothesis tests, and interval estimators, including maximum likelihood. Credit not given for both ST 522 and ST 502.

ST 503 Fundamentals of Linear Models and Regression 3.
P: ST 501; C: ST 502.

ST 505 Applied Nonparametric Statistics 3.
Prerequisite: ST 372 or ST 511.
Statistical methods requiring relatively mild assumptions about the form of the population distribution. Hypothesis testing, point and interval estimation and multiple comparison procedures for a variety of statistical problems.

ST 506 Sampling Animal Populations 3.
Prerequisite: ST 512.
Statistical methods applicable to sampling of wildlife populations, including capture-recapture, removal, change in ratio, quadrat and line transect sampling. Emphasis on model assumptions and study design.

ST 507 Statistics For the Behavioral Sciences I 3.
A general introduction to the use of descriptive and inferential statistics in behavioral science research. Methods for describing and summarizing data presented, followed by procedures for estimating population parameters and testing hypotheses concerning summarized data.

ST 508 Statistics For the Behavioral Sciences II 3.
Prerequisite: ST 507.
Introduction to use of statistical design principles in behavioral science research. Presentation of use of a statistical model to represent structure of data collected from a designed experiment or survey study. Opportunities provided for use of a computer to perform analyses of data, to evaluate proposed statistical model and to assist in post-hoc analysis procedures. Least squares principles used to integrate topics of multiple linear regression analysis, the analysis of variance and analysis of covariance.
ST 511 Experimental Statistics For Biological Sciences I 3.  
Prerequisite: ST 311 or Graduate standing.  
Basic concepts of statistical models and use of samples; variation, statistical measures, distributions, tests of significance, analysis of variance and elementary experimental design, regression and correlation, chi-square.

ST 512 Experimental Statistics For Biological Sciences II 3.  
Prerequisite: ST 511.  
Covariance, multiple regression, curvilinear regression, concepts of experimental design, factorial experiments, confounded factorials, individual degrees of freedom and split-plot experiments. Computing laboratory addressing computational issues and use of statistical software.

ST 513 Statistics for Management I 3.  
Prerequisite: Graduate standing.  
Analysis of data to represent facts, guide decisions and test opinions in managing systems and processes. Graphical and numerical data analysis for descriptive and predictive decisions. Scatter plot smoothing and regression analysis. Basic statistical inference. Integrated use of computer.

ST 514 Statistics For Management and Social Sciences II 3.  
Prerequisite: ST 507.  
Linear regression, multiple regression and concepts of designed experiments in an integrated approach, principles of the design and analysis of sample surveys, use of computer for analysis of data.

ST 515 Experimental Statistics for Engineers I 3.  
Prerequisite: ST 361 or Graduate standing.  
General statistical concepts and techniques useful to research workers in engineering, textiles, wood technology, etc. Probability distributions, measurement of precision, simple and multiple regression, tests of significance, analysis of variance, enumeration data and experimental design.

ST 516 Experimental Statistics For Engineers II 3.  
Prerequisite: ST 515.  
General statistical concepts and techniques useful to research workers in engineering, textiles, wood technology, etc. Probability distributions, measurement of precision, simple and multiple regression, tests of significance, analysis of variance, enumeration data and experimental design.

ST 519 Teaching and Learning of Statistical Thinking 3.  
Prerequisite: ST 507 or ST 511.  
This course is designed to bridge theory and practice on how students develop understandings of key concepts in data analysis, statistics, and probability. Discussion of students' understandings, teaching strategies and the use of manipulatives and technology tools. Topics include distribution, measures of center and spread, sampling, sampling distribution, randomness, and law of large numbers. Must complete a first level graduate statistics course (ST 507, ST 511, or equivalent) before enrolling.

ST 520 Statistical Principles of Clinical Trials and Epidemiology 3.  
Prerequisite: ST 511, Corequisite: ST 512.  

ST 521 Statistical Theory I 3.  
Corequisite: MA 425 or MA 511 and MA 405.  
Probability tools for statistics: description of discrete and absolutely continuous distributions, expected values, moments, moment generating functions, transformation of random variables, marginal and conditional distributions, independence, orderstatistics, multivariate distributions, concept of random sample, derivation of many sampling distributions.

ST 522 Statistical Theory II 3.  
Prerequisite: MA 511 or MA 425 and ST 521.  
General framework for statistical inference. Point estimators: biased and unbiased, minimum variance unbiased, least mean square error, maximum likelihood and least squares, asymptotic properties. Interval estimators and tests of hypotheses: confidence intervals, power functions, Neyman-Pearson lemma, likelihood ratio tests, unbiasedness, efficiency and sufficiency.

ST 524 Statistics In Plant Science 3.  
Prerequisite: ST 512.  
Principles and techniques of planning, establishing and executing field experiments in an integrated approach, principles of the design and analysis of sample surveys, use of computer for analysis of data.

ST 525 Statistical Process Control 3.  
Prerequisite: ST 515, Students must have access to an MS-DOS PC.  

ST 526 Probability and Stochastic Processes I 3.  
Prerequisite: MA 421 and MA 425 or MA 511.  
Modern introduction to Probability Theory and Stochastic Processes. The choice of material is motivated by applications to problems such as queueing networks, filtering and financial mathematics. Topics include: review of discrete probability and continuous random variables, random walks, markov chains, martingales, stopping times, erodicity, conditional expectations, continuous-time Markov chains, laws of large numbers, central limit theorem and large deviations.

ST 552 Linear Models and Variance Components 3.  
Prerequisite: MA 405, ST 521, Corequisite: ST 522.  
ST 555 Statistical Programming I 3.
An introduction to the data-handling techniques that are required to apply statistical methods including the importing, validating, and exporting of data files; manipulating, subsetting, and grouping data; merging and appending data sets; and basic reports including tables and graphics. Students learn SAS, the industry standard for statistical practice, and the R language commonly used in upper level statistics courses. Regular access to computer for homework and class exercises is required. Credit for both ST 445 and ST 555 is not allowed.

ST 556 Statistical Programming II 3.
P: ST 555 or Base SAS Certification.
Statistical procedures for importing/managing complex data structures using SQL, automated analysis using macro programming, basic simulation methods and text parsing/analysis procedures. Students learn SAS, the industry standard for statistical practice. Regular access to a computer for homework and class exercises is required.

ST 557 Using Technology to Teach Statistics 3.
P: ST 508 or ST 512.
This course will provide statistics educators with an in-depth introduction to applying technology for teaching college statistics. In this course, students will explore a variety of available statistical packages, demonstration applets, and other technologies for teaching statistics. Students will learn pedagogy to help them structure learning activities around these technologies. Students will also learn to identify key elements in technologies that support pedagogical goals.

ST 561 Intermediate Econometrics 3.
Prerequisite: ECG 700 and ST 514.
Formalization of economic hypotheses into testable relationships and application of appropriate statistical techniques. Major attention to procedures applicable for single equation stochastic models expressing microeconomic and macroeconomic relationship ships. Statistical considerations relevant in working with time series and cross sectional data in economic investigations. Survey of simultaneous equation models and the available estimation techniques.

ST 562 Data Mining with SAS Enterprise Miner 3.
Prerequisite: ST 512 or ST 514 or ST 515 or ST 517.
This is a hands-on course using modeling techniques designed mostly for large observational studies. Estimation topics include recursive splitting, ordinary and logistic regression, neural networks, and discriminant analysis. Clustering and association analysis are covered under the topic "unsupervised learning," and the use of training and validation data sets is emphasized. Model evaluation alternatives to statistical significance include lift charts and receiver operating characteristic curves. SAS Enterprise Miner is used in the demonstrations, and some knowledge of basic SAS programming is helpful.

ST 590 Special Topics 1-3.

ST 601 Seminar 1.

ST 610 Topics in Stat 1-99.
Special topics in Statistics.

ST 630 Independent Study 1-3.

ST 635 Readings 1-3.

ST 641 Statistical Consulting 1.
Prerequisite: ST 512 and ST 522.
Participation in regularly scheduled supervised statistical consulting sessions with faculty member and client. Consultant's report written for each session. Regularly scheduled meetings with course instructor and other student consultants to present and discuss consulting experiences.

ST 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ST 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

ST 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

ST 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits Arranged.

ST 706 Nonlinear Programming 3.
Prerequisite: OR(IE,MA) 505 and MA 425.
An advanced mathematical treatment of analytical and algorithmic aspects of finite dimensional nonlinear programming. Including an examination of structure and effectiveness of computational methods for unconstrained and constrained minimization. Special attention directed toward current research and recent developments in the field.

ST 708 Applied Least Squares 3.
Prerequisite: ST 512.
Least squares estimation and hypothesis testing procedures for linear models. Consideration of regression, analysis of variance and covariance in a unified manner. Emphasis on use of the computer to apply these techniques to experimental (including unequal cell sizes) and survey situations.

ST 711 Design Of Experiments 3.
Prerequisite: ST 512.
Review of completely randomized, randomized complete block and Latin square designs and basic concepts in the techniques of experimental design. Designs and analysis methods in factorial experiments, confounded factorials, response surface methodology, change-over design, split-plot experiments and incomplete block designs. Examples used to illustrate application and analysis of these designs.

Prerequisite: ST 422, ST 512.
ST 721 Genetic Data Analysis 3.
Prerequisite: ST 430 and GN 411.

ST 730 Applied Time Series Analysis 3.
Prerequisite: ST 512.
An introduction to use of statistical methods for analyzing and forecasting data observed over time. Trigonometric regression, periodogram/spectral analysis. Smoothing. Autoregressive moving average models. Regression with autocorrelated errors. Linear filters and bivariate spectral analysis. Stress on methods and applications; software implementations described and used in assignments.

ST 731 Applied Multivariate Statistical Analysis 3.
Prerequisite: ST 512.
An introduction to use of multivariate statistical methods in analysis of data collected in experiments and surveys. Topics covered including multivariate analysis of variance, discriminant analysis, canonical correlation analysis and principal components analysis. Emphasis upon use of a computer to perform multivariate statistical analysis calculations.

ST 732 Applied Longitudinal Data Analysis 3.
Prerequisite: ST 512.

ST 733 Applied Spatial Statistics 3.
Prerequisite: ST 512.
Graphical and quantitative description of spatial data. Kriging, block kriging and cokriging. Common variogram models. Analysis of mean-nonstationary data by median polish and universal kriging. Spatial autoregressive models, estimation and testing. Spatial sampling procedures. Use of existing software with emphasis on analysis of real data from the environmental, geological and agricultural sciences.

ST 740 Bayesian Inference and Analysis 3.
Prerequisite: ST 522.
Introduction to Bayesian inference; specifying prior distributions; conjugate priors, summarizing posterior information, predictive distributions, hierarchical models, asymptotic consistency and asymptotic normality. Markov Chain Monte Carlo (MCMC) methods and the use of existing software (e.g., WinBUGS).

ST 744 Categorical Data Analysis 3.
Prerequisite: ST 512 and ST 522.
Statistical models and methods for categorical responses including the analysis of contingency tables, logistic and Poisson regression, and generalized linear models. Survey of asymptotic and exact methods and their implementation using standard statistical software.

ST 745 Analysis of Survival Data 3.
Prerequisite: ST 522.
Statistical methods for analysis of time-to-event data, with application to situations with data subject to right-censoring and staggered entry, including clinical trials. Survival distribution and hazard rate; Kaplan-Meier estimator for survival distribution and Greenwood's formula; log-rank and weighted long-rank tests; design issues in clinical trials. Regression models, including accelerated failure time and proportional hazards; partial likelihood; diagnostics.

ST 746 Introduction To Stochastic Processes 3.
Prerequisite: MA 405 and MA(ST) 546 or ST 521.
Markov chains and Markov processes, Poisson process, birth and death processes, queuing theory, renewal theory, stationary processes, Brownian motion.

ST 747 Probability and Stochastic Processes II 3.
Prerequisite: MA(ST) 546.
Fundamental mathematical results of probabilistic measure theory needed for advanced applications in stochastic processes. Probability measures, sigma-algebras, random variables, Lebesgue integration, expectation and conditional expectations w.r.t. sigma algebras, characteristic functions, notions of convergence of sequences of random variables, weak convergence of measures, Gaussian systems, Poisson processes, mixing properties, discrete-time martingales, continuous-time markov chains.

ST 748 Stochastic Differential Equations 3.
Prerequisite: MA(ST) 747.

ST 750 Introduction to Econometric Methods 3.
Prerequisite: ST 421; Corequisite: ST 422.
Introduction to principles of estimation of linear regression models, such as ordinary least squares and generalized least squares. Extensions to time series and panel data. Consideration of endogeneity and instrumental variables estimation. Limited dependent variable and sample selection models. Attention to implementation of econometric methods using a statistical package and microeconomic and macroeconomic data sets.

ST 751 Econometric Methods 3.
Prerequisite: ST 421, ST 422.
Introduction to important econometric methods of estimation such as Least Squares, Instrumental Variables, Maximum Likelihood, and Generalized Method of Moments and their application to the estimation of linear models for cross-sectional economic data. Discussion of important concepts in the asymptotic statistical analysis of vector process with application to the inference procedures based on the aforementioned estimation methods.
ST 752 Time Series Econometrics 3.
Prerequisite: ECG(ST) 751.
The characteristics of macroeconomic and financial time series data. Discussion of stationarity and non-stationarity as they relate to economic time series. Linear models for stationary economic time series: autoregressive moving average (ARMA) models; vector autoregressive (VAR) models. Linear models for nonstationary data: deterministic and stochastic trends; cointegration. Methods for capturing volatility of financial time series such as autoregressive conditional heteroscedasticity (ARCH) models. Generalized Method of Moments estimation of nonlinear dynamic models.

ST 753 Microeconometrics 3.
Prerequisite: ECG 751.
The characteristics of microeconomic data. Limited dependent variable models for cross-sectional microeconomic data: logit/probit models; tobit models; methods for accounting for sample selection; count data models; duration analysis; non-parametric methods. Panel data models: balanced and unbalanced panels; fixed and random effects; dynamic panel data models; limited dependent variables and panel data analysis.

ST 755 Advanced Analysis Of Variance and Variance Components 3.
Prerequisite: ST 512, ST 552.
Expected mean squares, exact and approximate tests of hypotheses for balanced and unbalanced data sets. Fixed, mixed and random models. Randomization theory. Estimation of variance components using regression, MINQUE and general quadratic unbiased estimation theory.

ST 756 Computational Molecular Evolution 3.
Prerequisite: GN 411 and ST 511.

ST 757 Statistics for Molecular Quantitative Genetics 3.
Prerequisite: ST 512 and GN 703 or ST 721.
Genetic mapping data. Linkage map reconstruction, quantitative genetic models. Statistical methods and computer programs for mapping quantitative trait loci and estimating genetic architecture of quantitative traits.

ST 758 Computation for Statistical Research 3.
Prerequisite: ST 522 and ST 552.
Computational tools for research in statistics, including applications of numerical linear algebra, optimization and random number generation, using the statistical language R. A project encompassing a simulation experiment will be required.

ST 762 Nonlinear Statistical Models for Univariate and Multivariate Response 3.
Prerequisite: ST 512, ST 552.
Inference for general nonlinear parametric statistical models for univariate and multivariate continuous and discrete response, including generalized linear models, nonlinear models with nonconstant variance, and generalized estimating equation procedures for multivariate response, including repeated measurement data. Linear and quadratic estimating equations, models for covariance structure, effects of model misspecification and robustness. Survey of major theoretical results and implementation using standard statistical software.

ST 771 Biomathematics I 3.
Prerequisite: Advanced calculus, reasonable background in biology.
Role of theory construction and model building in development of experimental science. Historical development of mathematical theories and models for growth of one-species populations (logistic and offshoots), including considerations of age distributions (matrix models, Leslie and Lopez; continuous theory, renewal equation). Some of the more elementary theories on the growth of organisms (von Bertalanffy and others; allometric theories; cultures grown in a chemostat). Mathematical theories oftwo and more species systems (predator-prey, competition, symbiosis; leading up to present-day research) and discussion of some similar models for chemical kinetics. Much emphasis on scrutiny of biological concepts as well as of mathematical structure of models in order to uncover both weak and strong points of models discussed. Mathematical treatment of differential equations in models stressing qualitative and graphical aspects, as well as certain aspects of discretization. Difference equation models.

ST 772 Biomathematics II 3.
Prerequisite: BMA 771, elementary probability theory.
Continuation of topics of BMA 771. Some more advanced mathematical techniques concerning nonlinear differential equations of types encountered in BMA 771: several concepts of stability, asymptotic directions, Liapunov functions; different time-scales. Comparison of deterministic and stochastic models for several biological problems including birth and death processes. Discussion of various other applications of mathematics to biology, some recent research.

ST 773 Stochastic Modeling 3.
Prerequisite: BMA 772 or ST (MA) 746.

ST 779 Advanced Probability 3.
Prerequisite: MA 425 and ST 521.
Sets and classes, sigma-fields and related structures, probability measures and extensions, random variables, expectation and integration, uniform integrability, inequalities, L_p-spaces, product spaces, independence, zero-one laws, convergence notions, characteristic functions, simplest limit theorems, absolute continuity, conditional expectation and conditional probabilities, martingales.

Prerequisite: ST 512 and ST 552.

Prerequisite: ST 512 and ST 552.
Theory and methods of time series analysis from frequency point of view. Harmonic analysis, complex demodulation and spectrum estimation. Frequency domain structure of stationary time series and space-time processes. Sampling distributions of commonly used statistics.
ST 784 Multivariate Analysis 3.
Prerequisite: ST 522.
Survey of multivariate statistical theory. Multivariate distributions including
the multinormal, Wishart, Hotelling’s T, Fisher-Roy-Hsu, Wilks’ and
multivariate Beta distributions. Applications of maximum likelihood
estimation, likelihood ratio testing and the union-intersection principle.
Development of the theory of Hotelling’s T tests and confidence sets,
discriminant analysis, canonical correlation, multivariate analysis of
variance and principal components.

ST 790 Advanced Special Topics 1-6.
ST 793 Advanced Statistical Inference 3.
Prerequisite: ST 522.
Statistical inference with emphasis on the use of statistical models,
construction and use of likelihoods, general estimating equations, and
large sample methods. Includes introduction to Bayesian statistics and
the jackknife and bootstrap.

ST 801 Seminar 1.
ST 810 Advanced Topics in Statistics 1-3.
ST 830 Independent Study 1-3.
ST 835 Readings 1-3.
ST 841 Statistical Consulting 1.
Prerequisite: ST 512 and ST 522.
Participation in regularly scheduled supervised statistical consulting
sessions with faculty member and client. Consultant’s report written for
each session. Regularly scheduled meetings with course instructor and
other student consultants to present and discuss consulting experiences.

ST 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the
student in planning for the teaching assignment, observe and provide
feedback to the student during the teaching assignment, and evaluate the
student upon completion of the assignment.

ST 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral
preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of
the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation Research.

ST 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course
work during a summer session and who will be devoting full time to thesis
research.

Prerequisite: Doctoral student.
For students who have completed all credit hour requirements, full-time
enrollment, preliminary examination, and residency requirements for the
doctoral degree, and are writing and defending their dissertations.

Sustainable Materials and Technology (SMT)

SMT - Sustainable Materials and Technology Courses

SMT 200 Introduction to Sustainability and Technology 1.
Co-requisite: WPS/SMT 201.
This laboratory is to be taken concurrently with SMT 201 - Sustainable
Materials for Green Housing. This laboratory will delve deeper into
courses require a Course Agreement for Students Enrolled in
Non-Standard Courses be completed by the student and faculty member
prior to registration by the department.

SMT 220 Recycling to Create a Sustainable Environment 2.
The goal of this class is to link the impetus for recycling and recycled
materials to the building of a sustainable world. Recycling efficiencies
various materials will be examined as well as recycling practices
and attitudes in other parts of the world. This course will explore the
technology, economics, markets, trade and social impacts due to the
recycling of materials. Case studies will provide an in-depth examination
of the problems and potentials for the recycling of selected recycled
materials. The use of Life Cycle Analysis (LCA) to evaluate recycling
alternatives will be introduced. The economic, policy, social and
resource availability drivers for recycling will be examined as well as the
technological, economic, market and social barriers to recycling.

SMT 230 Independent Study in Sustainable Materials & Technology 1-6.
Independent Study for Sustainable Materials & Technology students
at the freshman and sophomore level developed under the direction
of a faculty member. Individualized/Independent Study and Research
courses require a "Course Agreement for Students Enrolled in Non-
Standard Courses" be completed by the student and faculty member prior
to registration by the department.
SMT 294 Independent Study in Sustainable Materials & Technology 1-6.
Independent Study for Sustainable Materials & Technology students at the freshman and sophomore level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

SMT 295 Special Topics in Sustainable Materials and Technology 1-3.
Special Topics in Wood Products at the 200 level for offering of courses on an experimental basis.

SMT 301 Chemistry of Sustainable Materials 3.
Prerequisite: CH 101 and CH 102 and CH 220.
Introduction of polymer science concepts (thermal transitions, molecular weight, viscoelasticity) to sustainable materials such as wood, cork, starch, silk, etc. Detailed instruction on the chemistry of sustainable materials including reactivity, decay, the chemical aspects of thermal treatments, the separation of sustainable materials into their individual components, the reactivity and modification of the individual components, and the conversion of sustainable materials into energy products.

SMT 302 Processing of Biomaterials 4.
Prerequisite: SMT 202 or SMT 203.
Principles of the manufacturing processes used in the sustainable and renewable materials industries. Content includes primary and secondary manufacturing, theory of machining basics, and biomaterials-based composite fabrication. Field trips might require meeting outside of class time.

SMT 310 Introduction to Industrial Ecology 3.
In this course, students will explore the main concepts of industrial ecology for sustainable materials. Students will learn about environmental supply chain, manufacturing of products from sustainable materials such as wood and agricultural materials, and how we can learn from nature to close the manufacturing loop. To support the activities in these technical areas, students will also learn how to better manage time, how to work efficiently in teams, and how best to interact with their co-workers.

SMT 346 Sustainable Materials Business Marketing 3.
This course will examine the business and marketing approaches in the forest products industry from a theoretical as well as an applied perspective. Students will learn about business processes and how products, price, distribution, and promotion plays a role in the purchase behavior of consumers. Students will analyze situations and cases to solve real and hypothetical business problems in the forest products industry.

SMT 441 Mechanical Properties of Sustainable Materials 4.
Prerequisite: MA 121 and PY 211 and SMT 203.

SMT 444 Sustainable Composites and Biopolymers 3.
Prerequisite: SMT 301 and Senior standing in SMT.
Manufacture, properties, and processing of lignocellulosic composites and polymers such as laminates, strandboard, particleboard, fiberboard, and nanocomposites. Principles and application of basic techniques for manufacture and testing of composites according to product and quality standards.

SMT 483 Capstone in Sustainable Materials and Technology 3.
Restricted to students with Senior Standing in SMT.
Capstone course in sustainable materials and technology; integration of sustainable material and technology concepts with economic, environmental, and societal considerations; case studies and practicum in sustainable materials and technologies.

SMT 493 Independent Study in Sustainable Materials & Technology 1-6.
Independent Study for Sustainable Materials & Technology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

SMT 494 Independent Study in Sustainable Materials & Technology 1-6.
Independent Study for Sustainable Materials & Technology students at the advanced level developed under the direction of a faculty member. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

Technology Education (TED)

TED - Technology Education Courses

TED 530 Foundations for Teaching Technology 3.
Prerequisite: Graduate standing.
Three topics related to teaching technology at the secondary and post-secondary levels: philosophical and historical foundations; methodology and curriculum development; and current trends and issues. Emphasis is on developing critical thinking skills, research, technology skill development, and writing procedures.

Prerequisite: Graduate standing.
Current trends in the technology, techniques, and theories relating to technical graphics education. Discussion will center on assigned readings and student-researched presentations on topical subjects. Readings will be drawn from journals and texts, on-line databases and articles, and current news media sources.

TED 534 Instructional Design in Technical and Technology Education 3.
Prerequisite: Graduate standing.
Create instructional activities for technical and technology education. Examine learning theories appropriate for technical and technology education. Explore and apply models for instructional design. Examine issues relative to electronic applications in technical and technology education classrooms.

TED 536 Scientific and Technical Visualization: Theory and Practice 3.
Theory and practice of scientific and technical visualization as a means of displaying scientific data and concepts using graphical methods. Both practitioner and theory driven models of communication are considered. How computer and print graphics can be used to assist individuals in the exploration of scientific and technical concepts. Particular focus on how to integrate scientific/technical graphics into the instructional settings.
TED 551 Technology Education: A Discipline 3.
Prerequisite: Graduate standing or PBS status.
Defines essential attributes of technology and examines the relationship between technology education and related disciplines. Analyzes the theory, models, and literature that constitute the foundation of technology education. Synthesizes relevant research and identifies areas of needed research.

TED 552 Curricula for Emerging Technologies 3.
Prerequisite: Graduate standing or PBS status.
Analyze advanced technologies and develop instructional programs for technology education curricula in secondary schools. Topics include technologies in production, transportation and communication.

TED 555 Developing and Implementing Technology Education 3.
Prerequisite: Graduate standing or PBS status.
Technology Education curriculum trends, standards, design, implementation and management. Students will analyze current curricular trends and develop strategies for implementing and managing technology education programs.

TED 556 Laboratory Management and Safety in TED 3.
Prerequisite: Graduate standing.
Laboratory management, planning, and safety considerations for technology education. Analysis of recent research, environmental factors, development of a safety system, safety education, and legal implications. Use of student leaders in management of a safe learning environment. Offered by Distance Education Only.

TED 558 Teaching Creative Problem Solving 3.
Prerequisite: Graduate standing or PBS status.
Provides teachers with the opportunity to study the research associated with creativity and apply these theories to implement a creative problem solving program.

TED 601 Practicum in Technology Education 1-6.
Prerequisite: Graduate standing or PBS status.
Faculty supervised experience in educational, industrial or governmental setting where a student analyzes activities associated with planning, implementing and evaluating instructional and/or services in technology education. This plan is developed by students and approved by supervisor.

TED 602 Practicum in TED 1-3.

TED 610 Special Topics in Technology Education 1-6.
Prerequisite: Graduate standing or PBS status.
Individual or group of special topics in professional education. The faculty member determines the topic and mode of study after discussion with students.

TED 621 Special Problems in Technology Education 1-6.
Prerequisite: Graduate standing or PBS status.
Guided independent or group or current problems in technology education.

TED 641 Internship in Technology Education 3.
Prerequisite: Graduate standing or PBS status.
Classroom teachers will document products of learning to include: content pedagogy, student development, multiple instructional strategies, motivation and management, professional growth and community involvement.

TED 646 Field-based Research in Technology Education 3.
Prerequisite: Graduate standing or PBS status.
Employ methods of field-based research to examine and improve instructional effectiveness and student achievement.

TED 655 Internship in Graphic Communications Education 3.
Prerequisite: TED 530 or EOE 751 with Consent of Instructor.
Mentoring during a higher education level teaching experience in the field of technical graphics with emphasis on providing help in teaching visualization, graphical sciences, and technical graphics standards. *Course is offered as needed to 2-3 students at a time (independent Study).

TED 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

TED 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

TED 692 Research Project in Technology Education 1-6.
Prerequisite: ELP 732.
A project or problem in research in education for graduate students, supervised by members of graduate faculty. The research chosen on the basis of individual students' interests and not to be part of thesis or dissertation research.

TED 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Thesis research.

TED 696 Summer Thesis Res 1.

TED 709 Seminar in Technology Education 1-3.
Prerequisite: Graduate standing or PBS status.
Seminar type course with topics selected for each class with attention given to broad concepts of and issues facing technology education at each level of delivery and implementation.

TED 751 Technology Education: A Discipline 3.
Prerequisite: Graduate standing or PBS status.
Defines essential attributes of technology and examines the relationship between technology education and related disciplines. Analyzes the theory, models, and literature that constitute the foundation of technology education. Synthesizes relevant research and identifies areas of needed research.

TED 752 Curricula for Emerging Technologies 3.
Prerequisite: Graduate standing or PBS status.
Analyze advanced technologies and develop instructional programs for technology education curricula in secondary schools. Topics include technologies in production, transportation and communication.

TED 755 Developing and Implementing Technology Education 3.
Prerequisite: Graduate standing or PBS status.
Technology Education curriculum trends, standards, design, implementation and management. Students will analyze current curricular trends and develop strategies for implementing and managing technology education programs.
TED 756 Planning of Change in TED 3.  
Theories, research, strategies and practices needed to function as a technology education change agent; demonstrate a working knowledge of planned change in technology education; observe, assess, design and competently plan intervention strategies and aptly use behavioral tools to achieve success.

TED 757 Leadership Development in TED 3.  
Prerequisite: Graduate standing or PBS status.  
Research, development and practice of individual and organizational leadership in technology education. Content builds leadership knowledge, skill and practice with emphasis on student assessment and development.

TED 758 Teaching Creative Problem Solving 3.  
Prerequisite: Graduate standing or PBS status.  
Provides teachers with the opportunity to study the research associated with creativity and apply these theories to implement a creative problem solving program.

TED 801 Practicum in Technology Education 1-6.  
Prerequisite: Graduate standing or PBS status.  
Faculty supervised experience in educational, industrial or governmental setting where a student analyzes activities associated with planning, implementing and evaluating instructional and/or services in technology education. This plan is developed by student and approved by supervisor.

TED 810 Special Topics in Technology Education 1-6.  
Prerequisite: Graduate standing or PBS status.  
Individual or group of special topics in professional education. The faculty member determines the topic and mode of study after discussion with students.

TED 821 Special Problems in Technology Education 1-6.  
Prerequisite: Graduate standing or PBS status.  
Guided independent or group or current problems in technology education.

Prerequisite: Master's student.  
Dissertation research.

TED 896 Summer Dissert Res 1.  
Prerequisite: Doctoral student.  
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

Technology Engineering and Design Education (TDE)

TDE - Technology Engineering and Design Education Courses

TDE 101 Introduction to Technology Education 1.  
Orientation to technology teacher education curricula. Overview of the philosophy, objectives and scope of technology education programs in the public schools, multicultural and individual differences of students. A study of current technology issues will be conducted throughout the course.

Basic knowledge and skills needed to process common materials and produce functional products of woods, metals, plastics, and composite materials. Includes laboratory safety, use of hand tools, operation of materials, and teaching strategies. Laboratory experiences in materials testing and construction of multi-material projects.

TDE 131 Technology through Engineering and Design I 3.  
Prerequisite: TDE 110.  
Study of engineering and design processes used to solve technological problems, innovate and invent. Students will actively design, model and test solutions to technological problems and explore methods to teach middle and high school students about engineering design and the design process.

TDE 202 Introduction to Teaching Technology Engineering and Design Education 1.  
Prerequisite: Sophomore standing; Corequisite: ED 204.  
Introduction to teaching technology engineering and design education programs in middle and secondary schools. Field experiences and course assignments include two hours each week assisting classroom teachers in the public schools. Students are responsible for their own transportation to the field experience sites. Students are required to purchase internship liability insurance to participate in this course. Contact University Insurance & Risk Management for details on acquiring the insurance and the current charge. The URL for information on this policy is: http://www2.acs.ncsu.edu/insurance/Students.html.

TDE 205 Desktop Publishing and Imaging Technology 3.  
An introduction to digital document production and techniques. Explores software packages used in producing documents for print. Structured for public school teachers and other interested persons, the course introduces basic standards and concepts of page layout, copyright and trademark laws, document usability, readability, and methods of document production.

TDE 220 Civil Engineering Graphics 3.  
Civil engineering graphics is an introductory course in basic graphic principles for constructed facilities. The emphasis is on sketching and CAD (computer-aided design) drawing skills and how specific construction systems and materials selected for a design affect production of civil engineering drawings for buildings, residences, and other constructed facilities through CAD. Topics include orthographic and axonometric engineering drawing of site plans, plat plans, section details, utility structure details, elevations and related topics. Restricted to Civil Engineering Majors.

TDE 230 Scientific and Technical Visualization 3.  
Communication of scientific and technical information with graphics. Using current practice in science, technology, and engineering disciplines as the context, the class will use general and discipline-specific techniques to explore how to effectively communicate with graphics. Current software and computer technologies will be used to design and create graphics. Students will also learn to critically examine and discuss graphics produced by themselves and others.

TDE 261 Digital Media Education 3.  
Prerequisite: TDE 205.  
Image creation and control, aesthetics, production processes and environments, and media transfer are explored. This course emphasizes concepts of audio and video design, various digital media technologies, and nonlinear editing concepts through laboratory experiments and projects in radio, television, original audio development, and video production. TDE Majors or instructor permission.
TDE 331 Technology Through Engineering and Design II 3.
Prerequisite: TDE 131 and Corequisite: GC 350.
Students will explore the contributions of systems engineering for developing and sustaining our designed world. Appropriate measurement, analysis and simulation tools will be used to make informed decisions and solve problems. Students will explore methods to teach middle and high school students about engineering design and the design process. TDE Majors or instructor approval.

Contemporary and historical examples of the art and craft of ceramics will be studied. Experiences in designing ceramic forms and expressing individual ideas through the medium of clay.

TDE 359 Electronics Technology 3.
Prerequisite: Junior standing.
Direct current, alternating current, and semiconductors. Measurement and circuit behavior. Experimentation with application circuits.

Prerequisite: TDE 131 and GC 120.
Examination of current and projected technology topics which are growing in importance but are not presently reflected in the Technology Education programs of NC public schools. Laboratory experiences include development, revision, and field testing of appropriate learning activities for middle and high school students in the selected topic areas.

TDE 385 Robotics Education 1.
Corequisite: TDE 386.
This course is an introduction to design and invention system control mechanisms and robot sensors. Students will classify foundational technical developments in autonomous, computer, and radio-control teleoperations. Students will explore the history and evolution of robots and automation and their social, economic, industrial, and educational impacts.

TDE 386 Robotics Education Lab 3.
Corequisite: TDE 385.
Students will apply technological problem solving skills toward 21st century design and innovation. This includes experiences multiple robotics design and invention systems and related programming and designing, prototyping, and programming an autonomous robot to resolve a real world issue.

TDE 407 Field Work in Technology Education 1-6.
Supervised off-campus field experience in Technology Education that relates on-the-job experiences in the field to the technical competencies which are the content of the curriculum. May be repeated for a maximum of 6 credits.

TDE 452 Lab Planning in Technology Education 3.
Laboratory planning, management, and safety for technology education. Physical layout, selection, specification, and cost of equipment; the safe operation, repair and maintenance of power and hand tools; specification of expendable supplies, estimating, and ordering.

Prerequisite: Technology Education Majors, Admittance to teacher education candidacy.
Methods of teaching Technology Education. Emphasis on curriculum development, instructional methods, laboratory instruction, meeting needs of special populations, and management of student organizations. Field experiences and course assignments two hours each week. Students are responsible for their own transportation.

TDE 457 Student Teaching in Technology Education 1-8.
Skills and techniques involved in teaching technology education through practice in a public school setting.

TDE 481 Research & Development in Technology Education 3.
Prerequisite: TDE 331, TDE 385, and TDE 386.
Senior design, research, and development experience in technology education. Students research a problem, ideate potential solutions, select a final solution, construct a prototype, and complete a final report analyzing the chosen solution. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

TDE 490 Special Problems in Technology Education 1-6.
Prerequisite: Junior standing.
Supervised, independent investigation in a defined area of interest in Technology Education.

TDE 495 Senior Seminar in Technology Education 3.
Prerequisite: Junior standing.
An in-depth investigation of a topic or a set of problems and/or issues in Technology Education.

TDE 498 Independent Study in Technology Education 1-3.
Prerequisite: Junior standing.
Individual or group study of special topics in professional technology education. The topic and mode of study are determined by the faculty member after discussion with the student. May be repeated for a maximum of 6 credits. Individualized/Independent Study and Research courses require a “Course Agreement for Students Enrolled in Non-Standard Courses” be completed by the student and faculty member prior to registration by the department.

Textile Chemistry (TC)

TC - Textile Chemistry Courses

TC 530 The Chemistry Of Textile Auxiliaries 3.
Prerequisite: One yr. of organic chemistry.
Industrially important textile chemicals used for enhancing fiber and fabric properties such as durable press, water repellency, anti-soiling, flame retardancy, softness, stiffness, lubricity and other uses. Correlation of effect with structure, end-use influences, interaction with fabric and fibers, sources and synthetic routes, economic and environmental considerations.

TC 561 Organic Chemistry Of Polymers 3.
Prerequisite: TC 461 and CH 231 or CH 431.
Principles of step reaction and addition polymerizations; copolymerization; emulsion polymerization; ionic polymerization; characterization of polymers; molecular structure and properties.

TC 565 Polymer Applications and Technology 3.
Prerequisite: One yr. of organic chemistry, TC 461.
Poly(olefins), poly(vinyl chloride), poly(vinyl acetate), poly(urethanes), epoxies, silicones, styrene copolymers used as textile finishes, nonwoven binders, fabric coatings, composites, adhesives, foams, carpet backing adhesives. Emphasis upon synthesis, industrial processes, properties and products.

TC 589 Special Studies In Textile Engineering and Science 1-4.
Prerequisite: Senior standing or Graduate standing.
New or special course on developments in textile engineering and science. Specific topics and prerequisites identified vary. Generally used for first offering of a new course.
TC 601 Seminar 1.
Discussion of scientific articles and presentations; review and discussion of student papers and research problems.

TC 630 Independent Study 1-3.

TC 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

TC 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

TC 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

TC 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

TC 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis. Credits arranged.

TC 704 Fiber Formation--Theory and Practice 3.
Prerequisite: MA 341, PY 208.
Practical and theoretical analysis of the chemical and physical principles underlying conventional methods of converting bulk polymer to fiber; rheology; melt, dry and wet polymer extrusion; fiber drawing; heat setting; general theory applied to unit processes.

TC 705 Theory Of Dyeing 3.
Prerequisite: CH 433.

TC 706 Color Science 3.
Prerequisite: Senior standing or Graduate standing in TC, Corequisite: TC 707.
Basis of modern techniques for color specification, measurement, control and communication. Applications of color science to textiles, plastics, color reproduction, computer-based imaging and display systems. Basic concepts taught by computer color graphics.

TC 707 Color Laboratory 1.
Prerequisite: Senior standing or Graduate standing in TC, Corequisite: TC 706.
Exercises with modern methods and equipment to aid in understanding color perception, color science and color measurement. Computer color graphics exercises for comprehension of basic concepts. Independent projects in color science. Limited enrollment.

TC 720 Chemistry Of Dyes and Color 3.
Prerequisite: (CH 221 or CH 225) and (CH 223 or CH 227).
Correlation of color and chemical constitution, synthetic routes for popular dyes of all important types; electronic mechanisms for reactive dyes; chemistry of dye interactions with light, washing and other in-use influences; economic and environmental considerations.

TC 771 Polymer Microstructures, Conformations and Properties 3.
Prerequisite: CH 220.
Exploration of connections between microstructures and properties of polymers afforded by analysis of their conformational characteristics. Analysis of NMR spectroscopy and conformational energy estimates to establish polymer microstructures and resultant sizes and shapes of polymer chains, which then related to their unique and rich variety of physical properties.

TC 791 Special Topics In Textile Science 1-6.
Prerequisite: Senior standing or Graduate standing.
Intensive treatments of selected topics in textile, polymer and fiber science.

TC 792 Special Topics In Fiber Science 1-6.
Study of selected topics of particular interest in various advanced phases of fiber science.

TC 896 Summer Dissert Res 1.

Textile Engineering (TE)

TE - Textile Engineering Courses

TE 105 Textile Engineering: Materials and Systems 2.
Corequisite: CH 101.
Introduction to textile engineering, polymers and fibers with emphasis on applications. Discussions of what makes macromolecules unique and pairing of material properties to a given application. Other discussions by various TE faculty giving students a picture of the breadth of the program. This course will also help develop leadership/team work skills and oral/written communications.

TE 110 Computer-Based Modeling for Engineers 3.
Prerequisite: E 115, Corequisite: MA 141.
Introductory course in computer-based modeling and programming using Visual Basic for Applications. Emphasis on algorithm development and engineering problem solving. Methodical development of VBA within applications like Microsoft Excel and Access from specifications; documentation, style; control structures; classes and methods; data types and data abstraction; object-oriented programming and design; graphical user interface design. Projects: design problems from electrical, industrial, textile, and financial systems. Functional relationships will be given and programs will be designed and developed from a list of specifications.
TE 200 Introduction to Polymer Science and Engineering 3.
Prerequisite: Grade of C or better CH 101.
Science and engineering of large molecules. Correlation of molecular structure and properties of polymers in solution and in bulk. Introductory polymer synthesis and kinetics. Analysis of physical methods for characterization of molecular weight, morphology, rheology, and mechanical behavior. The content will be focused on polymer synthesis, structure, and properties. The course will focus on a thorough understanding of polymer concepts and definitions, equations to calculate properties, and equipment used to measure properties.

TE 201 Textile Engineering Science 4.
Prerequisite: Grade of C or better in MA 241, PY 205; and Corequisite: TE/ISE 110.
Structure, physical and mechanical properties of fibers; structure of assemblies. Structure/property relations. Laboratory exercises in characterization of fiber properties.

TE 205 Analog and Digital Circuits 4.
Prerequisite: C- or better in TE 110, PY 208, Corequisite: MA 241.
Fundamentals of analog and digital circuit analysis and design. The course will present the systematic analysis and design of AC and DC circuits using Ohms and Kirchhoff's laws, the node voltage method, Thevenin and Norton's theorem, Laplace Transforms, resistance, capacitance, inductance, operational amplifiers, and frequency response. Next, the design of combinatorial and synchronous sequential circuit design will be covered using Karnaugh maps, laws of Boolean algebra, flip-flops, state machines, and latches. Laboratory exercises will supplement the topics presented in class.

TE 301 Engineering Textile Structures I: Linear Assemblies 3.
Prerequisite: (MAE 206 or CE 214) and MA 242.
Engineering analysis of textile structures, especially yarns. Unit processes of production, handling and packaging. Production sequences, intermachine effects, machine design and their consequences on the textile product.

TE 302 Textile Manufacturing Processes and Systems II 4.
Prerequisite: TE 301 and C- or better in TE/ISE 110.

TE 303 Thermodynamics for Textile Engineers 3.
Prerequisite: MA 242, PY 208.
Introduction to the concept of energy and the laws governing the transfer and transformation of energy with an emphasis on thermodynamic properties and the First and Second Laws of Thermodynamics. The fundamentals of thermodynamics will be emphasized, although more applied examples and problems will be heavily utilized.

TE 401 Textile Engineering Design I 4.
Prerequisite: TE 302.
The design process including initial specification, design constraints, sources of information and design strategy. Development of fact-finding ability in areas unfamiliar to the student. Analysis of existing designs and the development of improved or new designs.

TE 402 Textile Engineering Design II 4.
Prerequisite: TE 401.
Application of textile engineering principles using team approach to design, construct and analyze novel engineering solutions to textile industry problems. Evaluation of design to assess the impact on worker, industry and society.

TE 404 Textile Engineering Quality Improvement 3.
Prerequisite: ST 370 and C- or better in TE/ISE 110.
Defining and quantifying quality of textile products; quality improvement using statistical process control (SPC) and design of experiment (DOE) techniques.

TE 424 Textile Engineering Quality Improvement Laboratory 1.
Corequisite: TE 404.
Application of process improvement methods to textile systems using statistical software. Laboratory supplements lecture material presented in TE 404.

Prerequisite: (MA 341 and TE 205) or CHE 312.
Dynamic analysis and continuous control of chemical and material engineering processes. Process modeling; stability analysis, design and selection of control schemes. Solution of differential equations using Laplace transform techniques.

Prerequisite: C- or better in TE/ISE 110 and JR standing.
Textile information system design, real-world constraints. Principles of hardware, software, security and ethics issues. Emphasis on solving a real world problem. Credit will not be given for both TE 440 and TE 540.

TE 463 Polymer Engineering 3.
Prerequisite: MAE 206 or BME 203; and Corequisite: TE 303, MAE 301, or MSE 301.
Chemical and physical properties of polymers and fibers; thermodynamics of crystallization, time dependent phenomena, fracture mechanics and rheology. Advanced topics in extrusion.

TE 466 Polymeric Biomaterials Engineering 3.
Prerequisite: PY 208 and (TE 200 or CH 220 or CH 221 or CH 225) and MAE 206 or CE 214.
In-depth study of the engineering design of biomedical polymers and implants. Polymeric biomaterials, including polymer synthesis and structure, polymer properties as related to designing orthopedic and vascular grafts. Designing textile products as biomaterials including surface modification and characterization techniques. Biodegradable polymers.

TE 467 Mechanics of Tissues & Implants Requirements 3.
Prerequisite: (ZO 160 or BIO 183) and (MAE 314 or CE 313).
Application of engineering and biological principles to understand the structure and performance of tendons, ligaments, skin, and bone; bone mechanics; viscoelasticity of soft biological tissues; models of soft biological tissues; mechanics of skeletal muscle; and tissue-derived devices as well as interfaces between native tissues and synthetic devices.

TE 492 Special Topics in Textile Engineering 1-3.
Presentation of material not normally available in regular course offerings or offering of new courses on a trial basis. Credits and content determined by faculty member in consultation with the Department Head.

TE 505 Textile Systems and Control 3.
Prerequisite: TE 305, CSC 114.
Theory and application of instruments and control systems used in modern textile plants. Description of basic instruments and computer systems along with their use in process control, production control, research and development.
TE 533 Lean Six Sigma Quality 3.  
**Prerequisite:** ST 361 and ST 371, or equivalent.  
Systematic approach (Lean Six Sigma philosophy) for improving products and processes. Defining the improvement opportunity, measurement system analysis, data collection, statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of Lean Six sigma methods to improve product or process.

TE 540 Textile Information Systems Design 3.  
**Prerequisite:** Introductory Programming Course.  
The course will focus on using rapid application development (RAD) tools to design and implement database-based driven applications in a client/server architecture. This includes the SQL database query language, utilizing VB.Net as the RAD environment to build decision support systems and how to integrate these tools together to design and build information systems. Credit will not be given for both TE 440 and TE 540.

TE 550 Clothing Comfort and Personal Protection Science 3.  
**R:** Graduate Standing or Permission of Instructor.  
The course presents scientific principles for characterization and development of comfortable and/or protective textiles and clothing. Properties associated with human tactile response, thermal comfort and heat stress are emphasized. Inherent issues of balancing comfort versus protection are illustrated by research studies on performance garments or protective clothing systems. Methods and standards for evaluating comfort and protective performance range from bench level instruments to system level tests for ensembles using instrumented manikins, human clothing wear trials, and physiological tests.

TE 551 Human Physiology for Clothing and Wearables 3.  
**R:** Graduate Standing or Permission of Instructor.  
This course addresses key principles involved in the interaction between textiles and the human being: basic anatomy and physiology, individual differences, heat balance and ergonomics. Effects of climate and clothing systems on physiology and ability to perform work, and thermal strain of active, clothed humans will be the focus. Students will conduct thermal analysis of human heat balance, including the influence of clothing. Measurements techniques related to exercise physiology, and application of sensors and instruments systems will be discussed.

TE 565 Textile Composites 3.  
**Prerequisite:** MA 341, MAE 206.  
Fiber architecture of textiles used for composites. Manufacturing processes and geometric quantification. Basic analysis for predicting elastic properties. Interrelationship of elastic properties and geometric quantities. Failure criteria for these materials.

TE 566 Polymeric Biomaterials Engineering 3.  
**Prerequisite:** PY 208 and (TE 200 or CH 220 or CH 221 or CH 225) and (MAE 206 or CE 214).  
In-depth study of the engineering design of biomedical polymers and implants. Polymeric biomaterials, including polymer synthesis and structure, polymer properties as related to designing orthopedic and vascular grafts. Designing textile products as biomaterials including polymer synthesis and modern polymer topics. The physics of polymer fibers. Graduate standing or permission of instructor.

TE 570 Polymer Physics 3.  
Polymer microstructures, polymer solutions, polymer physical states (including amorphous polymers, crystalline polymers, polymer melts, melting of polymers, glass-transition, and other transitions), polymer blends, polymer mechanical properties, polymer viscoelasticity and flow, multicomponent polymer systems, and modern polymer topics. The physics of polymer fibers. Graduate standing or permission of instructor.

TE 589 Special Studies In Textile Engineering and Science 1-4.  
**Prerequisite:** Senior standing or Graduate standing.  
New or special course on developments in textile engineering and science. Specific topics and prerequisites identified vary. Generally used for first offering of a new course.

TE 601 Seminar 1.  

TE 630 Independent Study 1-3.  

TE 676 Special Projects 1-3.  

TE 685 Master’s Supervised Teaching 1-3.  
**Prerequisite:** Master’s student.  
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

TE 690 Master’s Examination 1-9.  
**Prerequisite:** Master’s student.  
For students in non thesis master’s programs who have completed all other requirements of the degree except preparing for and taking the final master’s exam.

TE 693 Master’s Supervised Research 1-9.  
**Prerequisite:** Master’s student.  
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

TE 695 Master’s Thesis Research 1-9.  
**Prerequisite:** Master’s student.  
Thesis Research.

TE 696 Summer Thesis Research 1.  
**Prerequisite:** Master’s student.  
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

TE 699 Master’s Thesis Preparation 1-9.  
**Prerequisite:** Master’s student.  
For students who have completed all credit hour requirements and full-time enrollment for the master’s degree and are writing and defending their thesis. Credits arranged.

**Textile Materials Science (TMS)**

**TMS - Textile Materials Science Courses**

TMS 211 Introduction to Fiber Science 3.  
**Prerequisite:** MT 105 or TT 105 or PCC 101; **Corequisite:** MA 131 or MA 141.  
Properties of fibers related to type and chemical structure. Fiber classification and identification. Reaction to moisture, stress-strain properties, and methods of measuring physical properties. Relationship between polymer structure, fiber properties and utilization.

TMS 212 Yarn and Fabric Formation and Properties 2.  
**Prerequisite:** TMS 211.  
The development of products from textile and fibrous materials is a critical component of new product development in many industries, including textiles, retail, plastics, composites, transporations, and architecture. This course provides the technical information required for scientists to understand how textile and fiber-based products are manufactures, with a practical view to combining the new knowledge with a molecular level understanding of fibers for unique new product development.
TMS 214 Yarn and Fabric Formation and Properties Lab 1.  
**Prerequisite:** TMS 212.  
The development of products from textiles and fibrous materials is a 
critical component of new product development in many industry. This 
laboratory course provides hands-on exercises and demonstrations of 
key textile and fiber-based products are manufactured.

TMS 492 Special Topics in Textile Materials Science 1-3.  
**Prerequisite:** Master's student.  
Presentation of material not normally available in regular course 
offerings or offering of new courses on a trial basis. Credits and content 
determined by faculty member in consultation with the Department Head.

TMS 500 Fiber and Polymer Microscopy 3.  
**Prerequisite:** MA 242, PY 208, TC 203.  
Art and science of light and electron microscopy; theoretical and practical 
aspects of visibility, resolution and contrast. Laboratory practice in 
assembling, testing and using various microscopes and accessories in 
analyzing, describing and identifying unoriented and oriented crystalline 
or amorphous materials. Laboratory emphasis on study of fibers and 
polymers through transmission microscopy with polarized light.

TMS 521 Filament Yarn Production Processing and Properties 3.  
**Prerequisite:** Graduate standing or PBS status.  
Structure, properties and processes for manufacturing and treating 
continuous filament yarns. Response of fibers to elevated temperatures, 
twist, false twist and various bulking processes. Yarn structures 
and properties required for stretch and molded fabrics. Independent 
laboratory and critical literature review in general area of filament yarn 
processing, properties and test methods. credit not allowed for both 
TT 521 and TT 425.

TMS 565 Textile Composites 3.  
**Prerequisite:** MA 341, MAE 206.  
Fiber architecture of textiles used for composites. Manufacturing 
processes and geometric quantification. Basic analysis for predicting 
elastic properties. Interrelationship of elastic properties and geometric 
quantities. Failure criteria for these materials.

TMS 589 Special Studies In Textile Engineering and Science 1-4.  
**Prerequisite:** Senior standing or Graduate standing.  
New or special course on developments in textile engineering and 
science. Specific topics and prerequisites identified vary. Generally used 
for first offering of a new course.

TMS 676 Special Projects 1-3.  

TMS 685 Master's Supervised Teaching 1-3.  
**Prerequisite:** Master's student.  
Teaching experience under the mentorship of faculty who assist the 
student in planning for the teaching assignment, observe and provide 
feedback to the student during the teaching assignment, and evaluate the 
student upon completion of the assignment.

TMS 690 Master's Exam 1-9.  
**Prerequisite:** Master's student.  
For students in non thesis master's programs who have completed all 
other requirements of the degree except preparing for and taking the final 
master's exam.

TMS 693 Master's Supervised Research 1-9.  
**Prerequisite:** Master's student.  
Instruction in research and research under the mentorship of a member 
of the Graduate Faculty.

**Prerequisite:** Master's student.  
Thesis research.
TT 305 Introduction to Nonwoven Products and Processes 3.  
Prerequisite: TMS 211 and (MA 131 or MA 141) and (PY 211 or PY 205);  
Corequisite: (ST 311 or BUS 350 or ST 361 or ST 370).  
Fiber web/nonwoven fabrics produced directly from fibers or their  
precursors. Physical and chemical nature of local bonding and fiber  
entanglement. Viable processes for producing these fabrics. Economic  
justification for process and production. Product/process interaction. Plant  
visits whenever possible.

TT 312 Yarn Production and Processes II 3.  
Prerequisite: TT 221.  
Fiber and machine interactions in blending, carding, drawing and  
spinning. Drafting theories and the influence of fiber and machine  
variables on irregularity. The role of twist on yarn structure, properties  
and productivity. Developments and limitations in processing technology.

TT 321 Yarn Production and Properties II 3.  
Prerequisite: TT 221.  
Design and production of hand- and machine-knitted fabrics. Exploration  
of basic structures, color and textural effects. Development of design  
abilities through hand-production methods, including an introduction to Computer-  
integrated Design Systems and an awareness of industrial processes.

TT 327 Yarn Production and Properties 4.  
Prerequisite: TMS 211 and (MA 231 or MA 241); Co-requisite: PY 212.  
The processing of natural and man-made, fibers and filaments into yarns.  
The impact of fiber selection and processing parameters on the quality  
of the yarn and subsequent products. Major processing routes for staple  
fibers and filaments together with recent developments in applicable  
technologies.

Prerequisite: (ST 311 or BUS 350 or ST 361 or ST 370) and TMS 211  
and TT 221 and (PY 211 or PY 205) and (MA 231 or MA 241);  
Corequisite: TT 252 or (TT 341 and TT 351).  
Standards, principles and effects of test conditions in measuring basic  
physical and mechanical properties of textile materials. Design of test and  
interpretation of test results in relation to end-use performance, product  
development, process control, research and development and other  
requirements.

TT 341 Knitted Fabric Technology 3.  
Prerequisite: TT 221.  
Review of knitted fabric production techniques. Technology of more  
advanced weft and warp knitting. Jersey and rib fabric modification  
techniques, yarn knittability and productivity, yarns, creels, patterning  
and machinery developments, manufacture and properties of warp knit  
fabrics such as mesh, laid-in, weft insertion and plush. Quality measures,  
measurement and standards, defects and problem solving. Management  
of knitting operations.

TT 351 Woven Products and Processes 3.  
Prerequisite: TT 221 and (PY 212 or PY 208).  
Design and development of various woven textile products including  
their component properties, performance, requirements, structures, and  
methods of production. The primary objective of the course is to introduce  
students to various woven textile products, including those used in  
avtomotives, agriculture, construction, ETC. and stimulate understanding  
of their structure, performance requirements, and relevant manufacturing  
principles including braiding.

TT 371 Woven Textile Design 3.  
Prerequisite: TT 252.  
Design and production of woven fabrics. Exploration of various basic  
structures, color and textural effects. Development of design abilities  
through hand-production methods, including an introduction to Computer-  
integrated Design systems and an awareness of industrial processes.

TT 372 Knitted Textile Design 3.  
Prerequisite: TT 252.  
Design and production of hand- and machine-knitted fabrics. Exploration  
of basic structures, color and textural effects. Development of design  
abilities through hand- and machine-production methods, including an  
introduction to Computer-integrated Design Systems and an awareness of industrial processes.

TT 380 Management and Control of Textile and Apparel Systems 3.  
Prerequisite: FTM 217; Corequisite: TT 221.  
Management approaches, practices and basic economic considerations  
in the development, production and distribution of industrial and  
consumer textile and apparel products.

TT 401 Textile Technology Senior Design I 4.  
Prerequisite: TT 331, Senior standing.  
This is Part 1 of 2 for the Senior Capstone Design Course. Students  
work in cross-functional teams to research and solve real-world problems  
in fibers, polymers, and textile science utilizing their foundation skills  
in Textile Technology. TT 401 and TT 402 must be taken in the same  
a cademic year as the class is project and team dependent. Students will  
be required to meet outside the normal class times as well as expected  
to participate in various off-campus field trips and activities for successful  
completion of the project. Project sponsors will cover any transportation  
costs that are incurred. TT majors only.

TT 402 Textile Technology Senior Design II 4.  
Prerequisite: TT 401.  
This is Part 2 of 2 for the Senior Capstone Design Course. Students  
work in cross-functional teams to research and solve real-world problems  
in fibers, polymers, and textile science utilizing their foundation skills  
in Textile Technology. TT 401 and TT 402 must be taken in the same  
a cademic year as the class is project and team dependent. Students will  
be required to meet outside the normal class times as well as expected  
to participate in various off-campus field trips and activities for successful  
completion of the project. Project sponsors will cover any transportation  
costs that are incurred. TT majors only.

TT 405 Advanced Nonwovens Processing 3.  
Prerequisite: MA 241, PY 208, TT 305.  
Mechanisms used in the production of nonwoven materials. Design and  
operation of these mechanisms. Process flow, optimization of process  
parameters, influence of process parameters on product properties.

TT 406 Bonding Fundamentals in Nonwovens 3.  
Prerequisite: TT 405, MAE 308, MAE 310.  
Fundamentals of fluid mechanics and heat transfer mechanisms during  
the bonding of nonwovens. In-depth description of hydroentangling,  
thermal bonding and needle punching techniques. Modeling methods and  
laboratory work are assigned.

Prerequisite: ST 361 or ST 370; Corequisite: TT 405.  
Fundamentals of methods used in evaluating properties and performance  
of nonwovens. Assessment of thermal, mechanical, moisture transport  
and barrier properties of nonwovens. Reliability and interpretation of test  
results.

TT 408 Nonwoven Product Development 3.  
Prerequisite: TT 407.  
Fundamentals of nonwoven product development. In-depth knowledge  
of the materials, processes and nonwovens products. Design of a set of  
experiments intended for product development. Students work in teams  
to design, fabricate and evaluate nonwoven products.
TT 425 Textured Yarn Production and Properties 3.
Prerequisite: TT 331.

TT 431 Quality Management and Control In Textile Manufacturing 3.
Prerequisite: TT 331.
Principles of quality and process management and control in textile/apparel manufacturing with emphases in quality management systems, quality costs, statistical control chart procedures, process capability, acceptance sampling, and optimal process and product design and improvement methods.

TT 451 Advanced Woven Fabric Design 3.
Prerequisite: (TT 252 or TT 351) and Senior Standing.
Design and production requirements for highly specialized woven fabric structures. The laboratory activities will include a project on design from concept to final production and finishing.

TT 470 Jacquard Woven Fabric Design 3.
Prerequisite: TT 252, TT 371.
This course is dedicated to the study of Jacquard woven fabric design and structural technology through the use of CAD as both an aesthetic and technical tool, and will culminate in each student producing a unique fabric collection based upon his/her developed area of interest. Jacquard design for many different end uses is addressed, from art fabrics to unique specialty products. A field trip in this course will require personal transportation.

TT 480 Operations Management Decisions for Textiles 3.
Prerequisite: FTM 380, ACC 210, ST 361, (MA 131 and 132 or MA 141).
Quantitative techniques for decision making and management in the textile complex. Applications include vendor selection, plant location, retail inventory management, forcasting demand, project management, and logistics planning. Techniques covered include simulation, PERT/CPM, mathematical modeling.

TT 481 Design and Technology of Technical Textiles 3.
Prerequisite: TT 305, TT 341 and TT 351.
Performance requirements of various technical textiles. Underlying principles of design, application, manufacture, and evaluation of fibrous structures intended to meet specific end-use requirement.

TT 485 Textile Computer Integrated Enterprise 3.
Prerequisite: TT/FTM 380.
Survey of information technology in textile and apparel industries. Topics discussed include: computer aided design (CAD); computer aided manufacturing (CAM); computer aided engineering (CAE); material handling systems; automation and robotics; logistics and warehousing systems; retail product tracking, and Internet resources.

TT 486 Supply Chain Management in the Textile Industry 3.
Prerequisite: TT/FTM 380.
Study of the operations necessary to produce and distribute a product, starting with the procurement of the raw material used in making the goods and ending with the delivery of the finished product. Topics covered include approaches to solving problems in manufacturing, sourcing, transportation logistics, and retail operations within the Integrated Textile Complex. Credit cannot be given for both TAM486 and MT386.

TT 499 Textile Senior Project 4.
Prerequisite: Senior standing.
This is a project based course to be taken in the last semester of the Senior year. In this capstone course the students work in cross-functional teams to research and solve applied problems in textile related fields. The results of the projects will be presented formally at the end of the semester. Course should be taken in the last semester of the Senior year. It cannot be substituted by other project courses.

TT 500 Understanding the Textile Complex 3.
Prerequisite: Graduate standing.
This course provides an overview of product development, processing, managing, financing, etc., for the textile industry. It is designed to give new graduate students basic preparations for more advanced, required textile courses. Students will also gain insight into the research being conducted within the College of Textiles.

TT 503 Materials, Polymers, and Fibers used in Nonwovens 3.
Prerequisite: MA 141, PY 205, PCC 203.
Fundamentals of raw material used in nonwoven processes. Raw material production, chemical and physical properties of nonwoven raw materials and assessment of material properties. Introduction of structure/property relationships for these materials and how these relationships influence end use applications.

TT 504 Introduction to Nonwovens Processes and Products 3.
Prerequisite: MA 141; PY 205, Corequisite: TT503.
Fiber web/nonwoven fabrics produced directly from fibers or their precursors. Physical and chemical nature of local bonding and fiber entanglement. Viable process for producing these fabrics. Economic justification for process and production. Product/process interaction. Plant visits whenever possible.

TT 505 Advanced Nonwovens Processing 3.
Prerequisite: TT/NWS03, TT/NW504.
An in-depth understanding of the mechanisms and processes used in the production of nonwoven materials. Design and operation of these mechanisms and processes. Process flow, optimization of process parameters, influence of process parameters on product properties.

TT 507 Nonwoven Characterization Methods 3.
Prerequisite: ST 361, Corequisite: TT/NW 505.

TT 508 Nonwoven Product Development 3.
Prerequisite: TTNW505, TT/NW507.

TT 520 Yarn Processing Dynamics 3.
Prerequisite: Graduate standing or PBS status.
Principles and practice involved in modern yarn and manufacture; including machine-fiber interactions occurring during different processing stages. Not normally for credit for undergraduate textile majors.
TT 521 Filament Yarn Production Processing and Properties 3.
Prerequisite: Graduate standing or PBS status.
Structure, properties and processes for manufacturing and treating continuous filament yarns. Response of fibers to elevated temperatures, twist, false twist and various bulking processes. Yarn structures and properties required for stretch and molded fabrics. Independent laboratory and critical literature review in general area of filament yarn processing, properties and test methods. credit not allowed for both TT 521 and TT 425.

TT 530 Textile Quality and Process Control 3.
Prerequisite: TT 420. Corequisite: ST 511 or ST 515.
Quality control and improvement methods for textile processes and products including quality systems, statistical control chart procedures, process capabilities, acceptance sampling plans, textiles process and product designs, on-line and off-line control systems and specific quality factors governing textile products and processes and their variabilities.

TT 532 Evaluation of Biotextiles 3.
Prerequisite: ZO 160, TC 203, TMS 211, CH 220.
Evaluation of the performance of biotextiles and medical polymers in biological and microbiological environments, with an emphasis on "in vitro" and "in vivo" techniques for testing the biocompatibility and biostability of implantable biomedical products. Related issues will deal with quality assurance systems, inspection and sampling plans, ISO certification, GMP's, reference materials and organisms, and the use of accelerated tests an animal trials so as to meet regulatory requirements.

TT 533 Lean Six Sigma Quality 3.
Prerequisite: ST 361 and ST 371, or equivalent.
Systematic approach (Lean Six Sigma philosophy) for improving products and processes. Defining the improvement opportunity, measurement system analysis, data collection, statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of Lean Six sigma methods to improve product or process.

TT 535 Research Methods and Management 3.
Prerequisite: ST 361, Graduate standing.
Basic principles and methods of academic and industrial research, research ethics, search of knowledge bases, research hypothesis, scientific paradigm, theory development, optimal research design and execution of scientific experiments, regression methods, survey design, use of variance components for samping scheme, model building and validation, principles of industrial R&D, project design and management, intellectual property rights, and maximization of research output.

TT 549 Warp Knit Engineering and Structural Design 3.
Prerequisite: TT 443.

TT 550 Production Mechanics and Properties of Woven Fabrics 3.
Prerequisite: Graduate standing or PBS status.
Interrelation between mechanics of production and mechanical properties of woven fabric; unit operations required to prepare yarns for weaving and the mechanism employed in weaving; fabric structure, geometry and mechanical properties; designing for specific fabrics properties. Not normally for credit for undergraduate textiles majors.

TT 551 Advance Woven Fabric Design & Structures 3.
Prerequisite: Graduate standing.
Theory and practice of structural design and technology requirements for highly specialized woven fabrics. Emphasis upon resultant physical behavior of different fabrics and their components. Credit not allowed for TT 451 and TT 551.

TT 553 Formation and Structure of Woven and Knitted Fabrics 3.
The interrelation between the mechanics of production and mechanical properties of woven and knitted fabrics; unit operations required to prepare yarns for weaving and knitting and mechanisms employed in weaving and knitting; fabric structure, geometry and mechanical properties; designing for specific fabric properties. Students will not be allowed credit for TT 553 and (TT 541, TT 549, and TT 550).

TT 570 Textile Digital Design and Technology 3.
Prerequisite: Graduate standing.
This course focuses on design of textile products balancing industry and creative foci. Students will study a range of industry focused technologies and techniques essential to creation of textile products in a technology intensive environment. Basics of textile product design and relevant technologies will be covered along with methods and techniques to improve commercial textile product design process. Students will research in-depth a topic related to textile product design, and present their research in an oral format.

Prerequisite: TT 570.
This course builds on the concepts introduced in TT 570 with increased focus on professional practice and methods. Focus on advanced textile product design topics incorporating an industry focus and utilizing commercial technologies. Students will investigate in depth a textile product design industry application, technique or method of interest using individual and team based strategies. Topics include advanced study of textile product design concepts, techniques and preparation for professional competitions, displays and conferences.

TT 581 Technical Textiles 3.
Prerequisite: TT 520 or TT 521, and TT 550.
Performance requirements of various technical textiles. Underlying principles of design and manufacturing of fibrous structures to meet specific needs in mechanical and other behaviors.

TT 591 Special Studies in Textile Technology 1-4.
Prerequisite: Graduate standing or PBS status.
Special Studies in Textile Technology to fulfill needs not covered by current offering. Student and faculty required to submit topics to be covered to director of graduate programs within first week of semester.

TT 601 Seminar 1.
Discussion of scientific articles of interest to the textile industry; review and discussion of student papers and research problems.

TT 630 Independent Study in Textile Technology 1-3.
Problems of specific interest in textile technology. Preparation of report, in format suitable for publication required. One-page outline signed by advisor must be submitted to director of graduate programs within first week of semester. A maximum of 3 credit hours will be allowed towards Master of Textiles Degree. No credit is allowed towards MS (Textiles).
TTM 579 Textile Design Collection Studio 6. 
Prerequisite: FTD 374, FTD 475, FTD 476.
Execution of creative projects addressing textile design problems through synthesis of background research and investigation, and knowledge from previous courses; preparation of work for portfolio, juried exhibition and participation in industry based competitions. Professional textile design practices including advanced portfolio development concepts and presentation, development of textile collections for specified end uses with emphasis on ideation, refinement and design development, and visual communication. FTD-TD ABM and TATM graduate students only.

TTM 573 Management of Textile Product Development 3. 
Prerequisite: Graduate standing.
The course focuses on an integrated approach to new product design, development and marketing of textile products. This integrated approach includes a) innovation strategy and opportunity identification, b) the design process for textile products, c) market launch, and d) managing innovation. The course include diverse textile end-uses, including apparel, home textiles, transportation textiles, and medical textiles. Trends in textile product development are reviewed. The dynamics of business analysis and strategy, design prototypes, and product analysis and recommendation are analyzed.

TTM 501 Textile Enterprise Integration 3. 
Prerequisite: Graduate standing, Background in textile manufacturing.
Discussion of philosophy, strategy and technology of enterprise integration for textile manufacturing. Survey of enabling technologies such as computer-aided design; computer-aided manufacturing; material handling systems; information systems for control, supervision and planning; and internet resources.

Exploration of industry design software for apparel and other sewn products. U4ia visual design software, 3D to 2D pattern generation software, Gerber Accumark or Lectra pattern design programs, Adobe Illustrator and Photoshop, and other programs used by the industry to create, market and/or visualize products will be taught. Peripheral equipment essential to the design and visualization process will be included.

TTM 550 Textile Quality and Process Control 3. 
Prerequisite: TT 420, Corequisite: ST 511 or ST 515.
Quality control and improvement methods for textile processes and products including quality systems, statistical control chart procedures, process capabilities, acceptance sampling plans, textiles process and product designs, on-line and off-line control systems and specific quality factors governing textile products and processes and their variabilities.

TTM 533 Lean Six Sigma Quality 3. 
Prerequisite: ST 361 and ST 371, or equivalent.
Systematic approach (Lean Six Sigma philosophy) for improving products and processes. Defining the improvement opportunity, measurement system analysis, data collection, statistical analysis, design of experiment (DOE) methods, and statistical process control (SPC) methods. Application of Lean Six sigma methods to improve product or process.

TTM 535 Research Methods and Management 3. 
Prerequisite: ST 361, Graduate standing.
Basic principles and methods of academic and industrial research, research ethics, search of knowledge bases, research hypothesis, scientific paradigm, theory development, optimal research design and execution of scientific experiments, regression methods, survey design, use of variance components for sampling scheme, model building and validation, principles of industrial R&D, project design and management, intellectual property rights, and maximization of research output.

TTM 561 Strategic Technology Management in the Textile Complex 3. 
Prerequisite: Graduate standing or PBS status.
Management approaches and strategies for forecasting, planning, creating, and implementing technology changes in textile industry complex undergoing rapid market place and global competitive changes.

TTM 500 Textile Enterprise Integration 3. 
Prerequisite: Graduate standing, Background in textile manufacturing.
Discussion of philosophy, strategy and technology of enterprise integration for textile manufacturing. Survey of enabling technologies such as computer-aided design; computer-aided manufacturing; material handling systems; information systems for control, supervision and planning; and internet resources.

TTM 510 Apparel Technology Management 3. 
Prerequisite: Graduate standing or PBS status.
Role of the apparel complex in manufacturing and supplying products on demand to meet the quality and performance of the global customer. The critical juxtaposition of the textile supply together with retail demand studied to understand constraint manufacturing capacities and elasticities.

TTM 515 Apparel Production 3. 
Concepts and practices for the production of apparel items, beginning with development of basic fit blocks and extending through the reation of stylized garments using pattern engineering techniques, supported by computerized pattern development.

TTM 676 Special Projects Textile Technology 1-3.

TTM 685 Master's Supervised Teaching 1-3. 
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment and evaluate the student upon completion of the assignment.

TTM 690 Master's Examination 1-9. 
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

TTM 693 Master's Supervised Research 1-9. 
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis Research.

TTM 696 Summer Thesis Research 1. 
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Master's student.
For students who have completed all credit hour requirements and full-time enrollment for the master's degree and are writing and defending their thesis.

TTM 896 Summer Dissertation 1.

Textile Technology Management (TTM)
TTM 581 Global Textile and Apparel Business Dynamics 3.
Prerequisite: Graduate standing or PBS status.
An overview of the economic, competitive, technological and market dynamics of the international textile and apparel industries. Trends in demand, output and trade are reviewed. The dynamic forces shaping and transforming the industry internationally are analyzed. Patterns of change at the global, regional, national and company level are explained and the outlook for the industries is considered.

TTM 582 Global Textile Brand Management and Marketing 3.
The course provides an understanding of the global textile brand management and marketing environments, global markets, and marketing programs and organizations. Specific topics include a) the economic, social, political/legal, and cultural environments; b) global textile market opportunities and challenges; c) global textile and apparel marketing strategies, and d) creation and management of global textile and apparel marketing programs. Credit will not be allowed for both TAM 482 and TMM 582. Graduate standing.

TTM 583 Strategic Planning for Textile Firms 3.
Prerequisite: Graduate standing.
Elements of competitive strategy and planning methods within the textile complex with emphasis on the concepts of strategy in a mature industry, defining business in a global industry, resource allocation through strategic planning methods and implementing strategy in a single business and multi-business firms.

TTM 585 Market Research In Textiles 3.
Prerequisite: TAM (EC) 482.
A study and analysis of quantitative methods employed in market research in the textile industry. Function of market research and its proper orientation to management and decision making.

P: TTM 315,317, and 318 or FTD215, 216, and 321.
Graduate level fashion product design. Design and production of a "collection" using various methods of generating patterns for garments, such as flat pattern, draping CAD design techniques. Relationship of body configuration and fabrication to garment design. Emphasis on ideation, creativity, communication, fit quality and exhibition of a fashion collection. Work culminates in a fashion show or static exhibition. Restricted to TATM majors.

TTM 588 Global Perspectives in Textiles Supply Chain Management 3.
Study and analysis of global textile supply chains. Field trips to textile related companies and organizations are required. Students will conduct a research project on global supply chain issues. Course taught off campus for non US global perspectives. Students may not take this course more than once for the same global perspective.

Prerequisite: Graduate standing or PBS status.
Special Studies in Textile and Apparel, Technology and Management to fulfill needs not covered by current offerings. Student and faculty required to submit topics to be covered to director of graduate programs within first week of semester.

TTM 601 Seminar 1.
Discussion of scientific articles of interest to the textile industry; review and discussion of student papers and research problems.

TTM 630 Independent Study in Textile Technology Management 1-3.
Prerequisite: Graduate standing or PBS status.
Problems of specific interest in textile and apparel technology. Preparation of report, in a format suitable for publication required. One-page outline signed by advisor must be submitted within first week of semester.

Prerequisite: Graduate standing or PBS status.
Preq: Graduate standing or PBS student. This course is an Independent Study in Textile Product Development to fulfill needs not covered by current course offerings. Student and faculty are required to submit the topic to be covered to the graduate administrator within the first week of the semester. Either a paper or a presentation of a body of work will be the outcome of this effort.

TTM 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

TTM 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

TTM 761 Supply Chain Management and Information Technology 3.
R: Graduate Students Only.
Working knowledge of management concepts and information technologies to design and manage supply chain operations in textile complex. Deals with markets and operations distributed geographically and institutionally.

Prerequisite: Doctoral Student.
Advanced Special Studies in Textile Technology Management to fulfill needs not covered by current offerings. Students and faculty are required to submit topics to be covered to the graduate administrator before the start of semester.

TTM 801 Seminar 1.

TTM 830 Independent Study 1-3.

TTM 876 Special Project TTM 1-3.

TTM 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

TTM 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.
Prerequisite: Doctoral student.
Dissertation research.

TTM 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree and are writing and defending their dissertations.

Textile and Apparel Management (TAM)

TAM - TAM Courses

TAM 589 Special Studies In Textile Management and Technology 1-4.
Prerequisite: Senior standing.
New or special course on developments in textile management and technology. Specific topics and prerequisites vary.

Textiles (T)

T - Textiles Courses

T 101 Introduction to the College of Textiles 1.
Introduction topics related to the College of Textiles, the textile industry, all textile curricula, advising, academic skills, team work, research and personnel involved in the college. Students will not receive credit for both USC 301 and T 101.

T 102 Introduction to Product Evolution 2.
Students explore the new product development (NPD) process through analysis of case studies of how textile products are designed and developed for a variety of sectors of our economy, including automotive, medical, industrial, furniture, and clothing. Students develop critical thinking skills as they read a variety of texts and respond using several forms of writing techniques.

T 200 Introduction to Textiles 3.
Survey of textiles including technical and economic history of the industry; physical and chemical processes involved in producing textile products from raw materials; unique aesthetic, physical and chemical properties of textiles and how these properties are determined by raw materials and production processes; and influence of properties of textile materials on their utilization and performance. Not open to students required to take TT 105; open to transfer students.

T 491 Honors Seminar in Textiles 1.
Prerequisite: By invitation into Honors Program in Textiles.
A seminar on current university and industrial research in the field of textiles.

T 493 Industrial Internship in Textiles 3.
Prerequisite: Textile core courses.
Paid professional-level work experience in textiles, relating academic training in science and technology to industrial practice under professional guidance. Written and final oral presentation used for grading. Limited to three hours per student. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: GPA of 2.75 or better and JR standing.
Directed undergraduate research in Textiles and/or Apparel related areas that requires collaboration with students at an institution abroad. The research project is structured as an international team project in an applied field that allows students in different countries to work together using various communication tools. Students shall arrange international contacts and provide a written proposal of the project to the undergraduate administrator or course coordinator prior to registration. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Prerequisite: Junior standing in TECS; 2.8 GPA.
Independent research in Textile Engineering, Chemistry and Materials Science topics through experimental, theoretical and literature studies. Written and oral reports required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

T 498 Independent Research in Textile Engineering, Chemistry and Materials Science II 1-3.
Prerequisite: T 497.
Independent research in Textile Engineering, Chemistry and Materials Science topics through experimental, theoretical and literature studies. Written and oral reports required. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

Theatre (THE)

THE - Theatre Courses

THE 103 Introduction to the Theater 3.
Artistic, technical, historical, and literary areas of theater, including acting, directing, design, stagecraft, lighting, costume, makeup, and criticism.

THE 203 Theory and Practice of Acting 3.
Basic contemporary theories on acting, with practical application through classroom exercises. Role analysis, adaptation of voice and body to performance demands, and role development through various rehearsal activities.

THE 223 Stagecraft 3.
Fundamentals of scenery design, set construction, and related technical activities. Practical applications with use of design media and shop facilities. Required production participation in University Theater presentations.
THE 233 Introduction to Stage Lighting 3.
Prerequisite: THE 223.
Fundamentals and uses of stage lighting equipment and stage lighting design. Practical application of design media and shop facilities. Participation in production activity for University Theater presentations.

THE 234 Makeup Design for the Stage 3.
The process of design and application of makeup for the stage including techniques for character and age makeup, making and applying facial hair and other specialized techniques. Taught from the play script to production with emphasis on historical research, play analysis, and applications techniques. The course includes hands-on experience with makeup. May not be taken concurrently with ARS 236 or ARS 333. May not be taken concurrently with ARS 236 or ARS 333.

THE 236 Text to Stage 3.
Study of script preparation beginning with the directors’ and designers’ collaborative efforts through rehearsal process, to the production itself and ending with the final evaluation. Directors’ methods and designer processes in theory and practice. Attendance at one rehearsal and two productions is required. May not be taken concurrently with ARS 233 or 333. May not be taken concurrently with ARS 233 or ARS 333.

THE 293 Theater Practicum 1-6.
Practical experience in one or more of the various areas of artistic and technical theater through active participation in Thompson Theater’s play production program.

THE 294 Independent Study in Theater 1-3.
Individualized study in Theater under the supervision of faculty in the discipline. Mode of study, evaluation criteria, and credit hours to be determined in consultation with the supervising faculty and documented. Course may be taken a maximum of three times provided the topic is sufficiently different. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.

THE 303 Stage Directing 3.
Basic theory of directing and its application to theatrical production. Play reading, evaluation, casting procedure, staff organization, and rehearsal planning and practices. Laboratory productions of short plays.

THE 323 Introduction to Scenic Design 3.
Prerequisite: THE 103 or 223.
Aesthetics, elements, and principles of scenic design. Theories and applications to the physical stage in relation to the script. Practical applications with the use of design media in University Theater productions.

THE 333 Costume Design and Technology 3.
Prerequisite: THE 103 or THE 236.
The process of designing costumes taught from the perspective of both the play’s script and the anticipated production with emphasis on historical research, play analysis, rendering technique, and basic construction. Hands-on experience required. May not be taken concurrently with ARS 233 or ARS 236. May not be taken concurrently with ARS 233 or ARS 236.

THE 334 Advanced Acting 3.
Prerequisite: THE 203 or demonstrated competence in acting.
Advanced methods in role preparation through exercises in concentration, imagination, sensory and emotional recall, and other Stanislavskian techniques. Analyses and critiques of plays and in-class performances.

This course examines African American dramaturgy and its impact on American theatre. We will study plays from the early period, 1847-1938, and from the recent period, 1935-present. This course will investigate the thematic structure of each section of plays including family life, social protest, and religion. The course will also help students to better understand the social milieu that shaped the content of each play.

THE 352 Dress, Style, Change 3.
Prerequisite: Junior standing.
Interdisciplinary course focusing on historical and cultural principles of style as related to dress and fashion. Examination of fashion and stylistic trends in cycles of dress.

THE 363 Audition and Interpretation Techniques 3.
Cold-reading scenes broken down to meet challenges of theatrical auditions. Personal technique developed to interpret texts through exercises, monologues, and scenes. Promotion of self-awareness, confidence, and understanding of dramatic literature as reflector of contemporary and historic lives.

THE 398 Special Topics in University Theatre 1-3.
Presentation of material normally not available in regular course offerings, or offerings of a new course on a trial basis.

THE 403 Touring Theatre 3.
Prerequisite: Audition required.
A touring performance experience consisting of text analysis, characterization, role development, and performance of scripts.

THE 433 Period Styles in Acting 3.
Prerequisite: THE 493.
Characterization, role development, and performance of scripts.

THE 495 Special Topics in Toxicology 1-3.
Presentation of material normally not available in regular course offerings, or offerings of a new course on a trial basis.

TOX - Toxicology Courses

TOX 201 Poisons, People and the Environment 3.
Introduction to the fascinating world of chemical poisons including their many and varied effects on people as well as the environment. Learn how and why poisons have played an important role in history, how to critically evaluate the chemical risk information reported in the media, and the underlying principles of "the basic science of poisons."

TOX 401 Principles of Toxicology 4.
Prerequisite: CH 220 or CH 221 or CH 225; BIO 181 or ZO 160.
Introduce students to the basic principles of toxicology. Will cover the history and scope of the field; absorption, distribution, metabolism and elimination of toxicants; types and mechanisms of toxic action; carcinogenesis; environmental toxicology as well as human and ecological risk assessment.

TOX 415 Environmental Toxicology and Chemistry 4.
Prerequisite: CH 220 or CH 221 or CH 225; BIO 181 or ZO 160 recommended.
Environmental toxicology and chemistry including the sources, fate, and effects of chemicals in the environment. Emphasis on contemporary problems in human health and the environment.

TOX 495 Special Topics in Toxicology 1-3.
Offered as needed to present materials unavailable in regular course offerings or for offering new courses on a trial basis.
TOX 499 Undergraduate Research in Toxicology 1-3.
Prerequisite: Sophomore standing or higher.
Research for students in Toxicology. In lieu of a syllabus, student and
professor will prepare a contract which details the research and how
the results will be disseminated. Individualized/Independent Study and
Research courses require a Course Agreement for Students Enrolled in
Non-Standard Courses be completed by the student and faculty member
prior to registration by the department.

TOX 501 Principles of Toxicology 4.
Prerequisite: (CH 220 or CH 221 or CH 225) and (BIO 181 or ZO 160).
Introduction to basic principles of toxicology, including the history and
scope of the field; absorption, distribution, metabolism and elimination
of toxicants; types and mechanisms of toxic action; carcinogenesis;
environmental toxicology as well as human and ecological risk
assessment. Students cannot obtain credit for both TOX 401 and
TOX 501.

TOX 515 Environmental Toxicology 4.
Prerequisite: Two years of biology.
Evaluation of the nature, distribution and significance of microchemical
contamination. Emphasis on current, relevant problems.

TOX 595 Special Topics 1-6.

TOX 601 Toxicology Seminar 1.
Prerequisite: Graduate standing.

TOX 620 Special Problems 1-6.
Prerequisite: Graduate standing.
Topics include responsibility in science, environmental fate of chemicals,
developmental toxicology, lab rotations, journal club and wildlife
toxicology.

TOX 660 Free Radicals In Toxicology 1.
Prerequisite: BCH 451 and TOX 710.
Introduction to the field of free radicals and their role in toxicology and
health; chemical and physical properties of partially reduced oxygen
intermediates and the natural biological defense mechanisms.

TOX 688 Non-Thesis Masters Continuous Registration - Half Time
Registration 1.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all
credit hour requirements for their degree but need to maintain half-time
continuous registration to complete incomplete grades, projects, final
master’s exam, etc.

TOX 689 Non-Thesis Master Continuous Registration - Full Time
Registration 3.
Prerequisite: Master’s student.
For students in non-thesis master’s programs who have completed all
credit hour requirements for their degree but need to maintain full-time
continuous registration to complete incomplete grades, projects, final
master’s exam, etc. Students may register for this course a maximum of
one semester.

TOX 690 Master’s Exam 1-9.
Prerequisite: Master’s student.
For students in non thesis master’s programs who have completed all
other requirements of the degree except preparing for and taking the final
master’s exam.

TOX 693 Master’s Supervised Research 1-9.
Prerequisite: Master’s student.
Instruction in research and research under the mentorship of a member
of the Graduate Faculty.

TOX 695 Master’s Thesis Research 1-9.
Prerequisite: Master’s student.
Thesis research.

TOX 696 Summer Thesis Research 1.
Prerequisite: Master’s student.
For graduate students whose programs of work specify no formal course
work during a summer session and who will be devoting full time to thesis
research.

TOX 699 Master’s Thesis Preparation 1-9.
Prerequisite: Master’s student.
For students who have completed all credit hour requirements and full-
time enrollment for the master’s degree and are writing and defending
their theses.

TOX 701 Fundamentals of Toxicology 3.
Prerequisite: BCH 451, Senior standing or Graduate standing.
The basis of toxic action at cellular and molecular levels covering the
absorption, distribution, elimination and metabolism of toxicants; toxic
action (acute toxicity, carcinogenesis, mutagenesis, organ toxicity, etc.);
chemical classes of toxicants; and toxicity testing.

TOX 704 Chemical Risk Assessment 1.
Prerequisite: TOX 701, a ST course.
Concepts and vocabulary of risk assessment. Risk assessment models
and techniques used in cancer and non-cancer risk assessment and
strategies for successful risk communications. Case studies of risk
assessment and issues of current interest. Utilization of background in
toxicology and statistics to examine a critical end-point in toxicological
science, the quantitative risk assessment.

TOX 710 Molecular and Biochemical Toxicology 3.
Prerequisite: BCH 451, TOX 710.
Fundamental understanding of biochemical, molecular and cellular
mechanisms through which xenobiotics alter cellular homeostasis,
produce toxicity and alter organ function. Current biochemical,
molecular and cellular experimental approaches for study of biochemical
mechanisms of toxicity.

TOX 715 Environmental Toxicology 3.
Prerequisite: Two years of biology.
Evaluation of fundamental processes relating fate and effects of
chemicals in the environment. Emphasis on effects of pollutants on non-
human species, environmental risk assessment and historically relevant
incidents of environmental contaminants.

TOX 725 Pesticide Chemistry 1.
Prerequisite: (CH 201 or CH 203) and (CH 221 or CH 225).
Chemical properties of pesticides including hydration and solvation,
ionization, volatilization, lipophilicity, molecular structure and size, and
reactivity and classification according to chemical description, mode of
action or ionizability. Taught during the first 5 weeks of semester. Drop
date is last day of 3rd week of the minicourse.

TOX 727 Pesticide Behavior and Fate In the Environment 2.
Prerequisite: CS(HS, SSC, TOX) 725, SSC 200.
Sorption/desorption, soil reactivity, movement, volatilization,
bioavailability, degradation and stability of pesticides in the environment.
Taught during the last 10 weeks of semester. Drop date is last day of 3rd
week of the minicourse.
TOX 771 Cancer Biology 4.
Prerequisite: CBS 770.
A comprehensive graduate course focusing on the molecular and cellular bases of cancer. Targets of oncogenic mutations will be discussed as well as their impact on cell proliferation, cell survival, and the invasion of normal tissues by tumorigenic cells. State-of-the-art technologies to detect oncogenic mutations and characterize transformed cells will be discussed as well as therapeutic strategies for the rational treatment of cancer.

TOX 795 Special Topics in Toxicology 1-6.

TOX 801 Toxicology Seminar 1.
Prerequisite: Graduate standing.

TOX 820 Special Problems In Toxicology 1-6.
Prerequisite: Graduate standing.
Topics include responsibility in science, environmental fate of chemicals, developmental toxicology, lab rotations, Journal Club, and wildlife toxicology.

TOX 860 Free Radicals in Toxicology 1.
Prerequisite: BCH 451 and TOX 710.
Introduction to the field of free radicals and their role in toxicology and health; chemical and physical properties of partially reduced oxygen intermediates and the natural biological defense mechanisms.

TOX 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

TOX 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.

USP - University Scholars Program Courses

USP 110 Humanities and Social Sciences Scholars Forum 0.
Prerequisite: Enrollment limited to participants in the University Scholars Program.
Interdisciplinary seminar series with presentations by distinguished faculty members and experts drawn from technical, academic, business and government communities. Discussions of major public issues and topics of contemporary concern.

USP 111 Humanities and Social Sciences Scholars Forum 0.
Prerequisite: Enrollment limited to participants in the University Scholars Program.
Interdisciplinary seminar series with presentations by distinguished faculty members and experts drawn from technical, academic, business and government communities. Discussions of major public issues and topics of contemporary concern.

USP 201 Great Decisions 1.
Prerequisite: 3 semesters of USP 110/111; R: RS/CS students.
Discussion and investigation of major issues in contemporary American foreign policy selected annually by the Foreign Policy Association through its Great Decisions Program. Must be participants in the University Scholars Program. Must have completed three semesters of the Scholars Forum (USP 110/111). Must have GPA of at least 3.25.

USP 204 Readings Inspired By the Scholars Forum 1.
Prerequisite: 3 semesters of USP 110/111; R: RS/CS students.
Seminar course for upper class University Scholars who have completed three semesters of the Scholars Forum, with readings drawn from upcoming Scholars Forum themes.

University Studies Course (USC)

USC - University Studies Course Courses

USC 100 Transition into a Diverse Community 1.
USC 100 is required for all Summer Start students. It is designed to assist freshmen in making an effective transition to the rigors of a large diverse research-focused university. The course is designed to provide students with the support and knowledge needed to address the academic and personal challenges as well as other transitional issues. This course will also help students understand how culture shapes identity. Classroom discussions, small group work, completion of StrengthsQuest, and an introduction to technological and other resources are all vital components of this course. Topics include: diversity, cultural awareness, StrengthsQuest, academic adjustment, college success, social adjustment, campus resources, and health.

USC 101 Introduction to University Education I 1.
Developmental and academic topics to assist students as they make well-informed decisions about majors. Topics include: transition issues between high school and college; community and diversity; major and career decision making; assessment of interests, skills, and values; available university resources; overview of university majors and minors as well as policies and procedures. FYC students only. Student cannot get credit for both USC 101 and 103.

USC 102 Introduction to University Education II 1.
Prerequisite: USC 101.
Continuation of USC 101: Emphasis on making a decision with respect to an undergraduate major. Credit may not be earned for both USC 102 and 104. FYC Students Only; Credit cannot be received for both USC 102 and 104.

U.S. Diversity (USD)

USD - USD Courses

USD 295 U.S. Diversity Special Topics 1-3.
Special topics course offering for the general education U.S. Diversity category.

University Scholars Program (USP)
USC 103 Introduction to University Education for Varsity Student Athletes I 1.
Introduction to University Education for Varsity Student Athletes I provides success strategies for first year student athletes at North Carolina State University. The course is designed to assist student-athletes with the skills and knowledge needed to meet the academic and personal challenges of university life and the increased responsibilities of adulthood, with special attention to the unique challenges and opportunities of student-athletes. Topics include: goal setting, time management, study skills, critical thinking, interaction with the faculty, NCAA and NCSU continuing eligibility, academic integrity, nutrition, and diversity.

USC 104 Introduction to University Education for Varsity Student-Athletes II 1.
Prerequisite: USC 103.
Introduction to University Education for Varsity Student-Athletes II will provide student-athletes with the skills necessary to promote informed decision making in choosing an appropriate major and exploring possible careers. Additional areas of career development, academic success, and personal development will also be addressed as they would relate to the day-to-day responsibilities and challenges that student-athletes face, as well as a review of NCAA and NCSU continuing eligibility.

USC 110 Freshman Advancement Seminar 1.
USC 110 provides an opportunity for a diverse student population to explore the question of race and cultural differences in a global society. This course requires that participants actively explore their biases and cultural prejudices for greater enlightenment. This course challenges sources of conventional information such as media outlets, empirical data and prevailing folklore. The course represents an opportunity to have a positive impact on the matriculation and graduation rate of diverse student populations through positive reinforcement, affirmation of cultural heritage and background. Freshman First Year Entering Students Only.

USC 111 Strategies for College Success 1.
This course is intended for students who need to improve their academic standing, with enrollment priority given to students readmitted on academic probation. Students will acquire policy and resource knowledge, practical skills, and strategies to improve their academic standing at NC State University. Students will address the academic and personal challenges that may have impacted progress towards their chosen degree. Department Consent Required.

USC 120 SERV- Seminar Education for Military Veterans/Service Members 1.
The USC 120 class will help military veteran/service members transition into the academic environment and campus community. Topics include academic success skills, academic culture, campus resources and student services. Military Veterans (Active and Veteran).

USC 202 Career Exploration and Development 2.
This course is intended for students who are considering changing their college major and/or are interested in exploring academic major opportunities. Career exploration and development provides students across campus a focused classroom setting to receive career exploration and academic major decision-making assistance. Students will learn about their personal strengths, values, skills, and personality and understand how these self-assessments will affect their major/career decisions. Students will explore the concept of career resiliency while developing professional skills that will be transferable into any college-major.

USC 210 Introduction to College Tutoring 1.
Prerequisite: Cumulative GPA greater than or equal to 3.25.
GPA 3.25 or higher. All enrolled students must be employed as UTC tutors. The purpose of the course is threefold: to introduce tutors to effective tutoring techniques based on educational research, to help tutors implement a variety of tutoring methods depending on the students’ specific needs, and to guide tutors in self-evaluating their individual tutoring progress and goals. Departmental Approval Required.

USC 220 Leadership and the Resident Mentor 3.
Course will provide the student basic concepts of involvement theory, group development theory and community development relevant to residence hall living as a paraprofessional leader on the campus; the basic principles related to leadership with emphasis on how one develops and leads with their values, beliefs and attitudes and develop skills involving active listening, communication, conflict management and mediation techniques; basic program development and presentation skills; teaching pedagogy; and diversity issues. Some out of classroom activities are required. Departmental approval required.

USC 223 Orientation Leader Development 2.
For new student orientation leaders only. Relevant research, student development theory, and shared professional experiences are presented. This course will offer learning opportunities that will provide class members with knowledge, attitude, and skills necessary to become effective orientation leaders. Class discussion, small groups activities, simulations, and journal writing employed. Individual projects and out-of-class team building experiences are required, including Saturday activities. Departmental Approval Required.

USC 225 Leadership Development for University Ambassadors 2.
Requisite: University Ambassadors Only.
Course provides University Ambassadors with the knowledge, mindset, and skills necessary to effectively represent the University in a variety of settings to a variety of constituents. Course prepares students to emerge as leaders within the Ambassador program and throughout their University experience. Restricted to University Ambassadors only.

USC 240 Leadership and Coalition Building in Diverse Communities 3.
Prerequisite: Class Level = Sophomore, Junior, or Senior.
Exploration of US diversity and effective leadership practices using the National Coalition Building Institute (NCBI) model. NCBI is an international non-profit leadership development network dedicated to elimination of racism and other forms of oppression. Students will be introduced to the NCBI model which involves significant self-discovery, active listening and dialogue, and participate in activities that establish leadership strategies applied in various contexts. Each practical learning tool is grounded in principles that will be explored through group discussions and reflective journaling. Specific skill training will focus on conflict resolution, creating inclusive environments, strategies for effective listening/communication, personal growth and development. This course is intended for undergraduates, sophomores and above.

USC 293 Independent Study 1-3.
A course in which students participate in individualized, independent, directed, or guided studies under the supervision of the instructor of the field or discipline. Topic, mode of study, evaluation criteria, and credit hours to be determined in consultation with the supervising faculty and documented. Course may be taken a maximum of three times provided the topic is sufficiently different. Individualized/Independent Study and Research courses require a "Course Agreement for Students Enrolled in Non-Standard Courses" be completed by the student and faculty member prior to registration by the department.
USC 298 Special Topics in University Studies 1-3.
Special Topics in University Studies at the Undergraduate level for offering of courses on an experimental basis.

USC 301 Transfer Student Success 1.
USC 301 is designed to assist new transfer students in making an effective transition to the rigors of a large research university. The course is designed to provide students with the skills and knowledge needed to address the academic and personal challenges as well as other transitional issues that may impact their progress toward their degree. Classroom discussions, small group work, guided tours, faculty mentors and introduction to resources, services and opportunities are all vital components of this course. Topics include: academic adjustment, social adjustment, campus resources, major and career exploration, policies and procedures, financial aid, and technology. COURSE IS RESTRICTED TO FIRST OR SECOND SEMESTER TRANSFER STUDENTS. Students will not received credit for both USC 301 and ALS 303 or T 101.

USC 401 Transitions for the College Graduate 3.
Focus on the unique transitions the student will face upon leaving college. Through a variety of formats, students will have the opportunity to explore several aspects of their post-baccalaureate lives and ways in coping with emerging careers, money management, extracurricular retirement, transitional issues, civic engagement, and continuing education opportunities. Explorations of these areas include specific emphasis on developing and refining interviewing skills, professional and personal networks, financial endeavors, and job application and selection.

Veterinary Medicine-Companion Animal & Sp Species (VMC)

VMC - Veterinary Medicine - CASS Courses

VMC 901 Advanced Small Animal Medicine 2.
Prerequisite: 3rd year DVM student.
This course provides more advanced instruction on medical and surgical diseases of dogs and cats. Pathophysiology, diagnostic evaluation and medical and surgical management of diseases in nephrology, urology, oncology, respiratory medicine, infectious diseases, gastroenterology, cardiology and endocrinology are contained within this course. This advanced content of this course is designed to run alongside the content in VMC 951.

VMC 904 Advanced Equine Theriogenology 1.
Prerequisite: 3rd year DVM student.
This course provides more advanced instruction in equine Theriogenology (mare and stallion). Diagnostic evaluation and techniques, with expansion on basic core concepts introduced in previous course content are contained within this course.

VMC 905 Advanced Topics in Small Animal Dermatology 1.
P: VMC 951.
This course will provide broad understanding of small animal dermatology by building upon the basic foundation principles covered in VMC 951. Students will learn to recognize, diagnose and treat both common and uncommon skin diseases of small animals.

VMC 906 Equine Field Skills Elective 2.
Prerequisite: 3rd year DVM student.
This course will provide practical instruction in commonly used skills and techniques necessary for equine primary care practice. It is an intensive, team taught series of individual laboratories that provide students with experience in the varied skill set required of an equine general practitioner. This course is designed for students that are in the third year of the DVM curriculum, have good horse handling skills and a desire to practice equine veterinary medicine upon graduation. Registration for this course is by instructor permission only.

VMC 909 Feline Medicine 1.
Prerequisite: 3rd year DVM student.
This course will equip students for success in feline practice or in small animal or mixed practice with a feline component. The course will address the basic behavioral and nutritional needs of cats, and students will learn how the unique physiology of this species affects feline health and feline disease management.

VMC 910 Careers in Veterinary Medicine 1.
Specialists and invited speakers from multiple areas of veterinary medicine will present information about career opportunities.

VMC 911 Advanced Topics in Equine Medicine and Surgery 1.
Prerequisite: VMB 921.
The major objectives are to expose students to additional in-depth information related to equine medicine and surgery. This course will build on information covered in equine portions of the veterinary curriculum. Students must have a degree in veterinary medicine, enrollment in the veterinary curriculum, or approval of the course coordinator.

VMC 912 Advanced Clinical and Professional Communication 1.
Prerequisite: 3rd year DVM student.
The ability to communicate with clients is important to successful veterinary practice. This course explores how to effectively communicate with clients in a clinical context during problem appointments. Students will develop verbal and nonverbal communication skills and an understanding of how to manage difficult client interactions including 1) communicating about money, 2) communicating during adverse events, and 3) communicating during euthanasia. Examples and cases from veterinary medicine and simulated client interactions will guide application of clinical communication in context.

VMC 913 Advanced Group Communication in Veterinary Medicine 1.
Prerequisite: 3rd year DVM student.
This course explores how to effectively communicate in small groups in a professional veterinary context. Students will develop verbal and nonverbal communication skills, an understanding of task/process balance, meeting management and facilitation techniques, and communication styles and strategies for dealing with challenging group situations and conflict management. Examples and cases from veterinary medicine will guide application of group communication in context. Course limited to students enrolled in the DVM curriculum.

VMC 915 Ethic Jurispru 2.
VMC 917 Pre Hlth & Mgmt I 1.
VMC 920 Subtropical Zoology and Medicine in Bermuda 1.
Prerequisite: Currently enrolled DVM student.
This unique opportunity will allow DVM students to experience a subtropical island and much of its natural history offerings. The internationally renowned Bermuda Institute of Ocean Science (BIOS) will serve as the base of operations where students will be housed, fed, and taught. Lectures, laboratory sessions, and field trips will cover a wide variety of zoological and medical topics.
VMC 921 Special Topics in Zoological Medicine 1-3.
Prerequisite: 1st, 2nd, or 3rd year DVM student.
This elective course allows students to participate in customized laboratory and field experiences in zoological medicine (avian, aquatic, reptile, amphibian, invertebrate, and mammalian species). This course is designed to be adapted to the needs of students in the DVM program who desire practical experiences in the discipline. Specific details of individual projects are developed by the course coordinator and participating faculty. This elective course can provide partial fulfillment for elective credit for Zoo Focus Area.

VMC 922 Veterinary Acupuncture in China 2.
Prerequisite: VMB 911 and VMB 921; Corequisite: Current enrollment in the DVM program.
This elective course is a two week international experience in China that will introduce DVM students to Traditional Chinese Veterinary Medicine (TCVM), including acupuncture, moxibustion, and related therapies. The course will include an overview of TCVM history, terminology, theory, and practical applications using equine (horse or donkey) and canine species. In addition, the course will include elective opportunities to meet and interact with Chinese veterinary students, and opportunities to explore the many cultural options available in China.

VMC 923 Research in Zoological Health 1-4.
Restriction: DVM student status. By Instructor Permission only.
This course provides an opportunity to pursue mentored research projects relevant to zoological health while in the DVM curriculum. Projects may be but are not limited to those related to the zoological focus thesis option.

VMC 924 Equatorial Zoology and Medicine in Galápagos 1.
Requisite: Currently enrolled DVM student.
This unique opportunity will allow DVM students to experience a unique, equatorial archipelago and much of its natural history offerings. The Galápagos Science Center (GSC) will serve as the base of operations. Dr. Gregory Lewbart, who has worked at the facility four separate times, will be the local program leader and guide. He will be assisted by local and visiting scientists. Lectures, laboratory sessions, and field trips will cover a wide variety of zoological and medical topics dealing with native invertebrates, fishes, reptiles, birds, and mammals. There will be an emphasis on aquatic species and a paper is required.

VMC 927 Introduction to Companion Animal Behavior 2.
Doctor of Veterinary Medicine Majors Only.
This course explores the behavior of companion animals from a veterinary perspective. An emphasis is placed on behavior as an indicator of welfare and health, humane handling of animals, prevention of behavior problems, and treatment of common behavior problems. In addition, the nature of human-animal bond and ethical issues relating to human-animal interactions will be discussed. Students will learn how to diagnose and treat common behavior problems on the basis of video-rich case presentations, lecture material, and class discussion. This course is restricted to students enrolled in the DVM Curriculum.

VMC 928 Chelonian Medicine and Surgery 1.
The NCSU-CVM Turtle Rescue Team treats sick and injured wild turtles belonging to nine different species. First, second, and third year veterinary students will be responsible for case management, coordinating consultations, diagnostic testing within the hospital, and placing recuperating animals with local wildlife rehabilitators. Students are also required to attend weekly rounds and make an oral presentation.

VMC 930 Rehabilitation and Mobility Clinical Rotation 2.
Prerequisite: Currently enrolled DVM student.
In this course, students will gain a general understanding of veterinary rehabilitation therapy, including principles and protocols of assessment and treatment, tissue healing, the theory and application of treatment modalities and the common conditions treated.

VMC 932 Principles of Surgery 3.
Prerequisite: 2nd year DVM student.
This course covers the science, art, and craft of surgery, as a foundation for clinical applications. The principles you learn will give you a foundation for performing surgery on all species, even though the examples in this course are centered on the dog and cat.

VMC 933 Theriogenology 2.
Prerequisite: Successful completion of the second year of the DVM program.
The physiology, endocrinology, and pathology of the reproductive system are presented. Emphasis includes genital anatomy and function, endocrine interrelationships, and methods for examination of mammary gland and reproductive tract function, including diagnosis and treatment of clinical disorders.

VMC 937 Introduction to Physical Examination Skills- Small Animal 1.
Introduction to physical examination, laboratory sample collection, and medication administration skills in dogs and cats. Students will also be taught how to understand and use the problem-oriented approach for patient management. Students must be enrolled in the Doctor of Veterinary Medicine program. Enrollment in year 2 of Doctor of Veterinary Medicine Program.

VMC 939 General Limited Small Animal Practice 2.
Will expose clinical year veterinary students to a general small animal veterinary practice. There will be several areas of focus: learning clinical skills relevant to a general veterinary practitioner; developing strong problem solving abilities; developing the strong communication skills necessary to interact effectively with client, colleagues and staff, incorporating and conducting behavioral evaluations of pets during wellness examinations. Enrollment in this course is limited to students in the DVM professional program.

VMC 940 Clinical Theriogenology 2.
This course is designed to instruct veterinary students to make clinical diagnoses and problems of the reproductive system of domestic animals. Instruction is provided on medical and surgical correction of clinical reproductive system problems, such as infertility, obstetrical procedures, assisted reproductive techniques, and traumatic injuries. Must be enrolled in fourth year clinical rotations.

VMC 941 Special Topics in Theriogenology 2.
The primary objective of this course is to provide additional information and training to veterinary students that have taken the VMP 980 (VMC 940 new course #) clinical theriogenology senior clinical rotation. Emphasis will be directed to acquaint students with modern and current practices of clinical Theriogenology. It is expected that the majority of the information and activities offered in this course will involve equine species (80%) and, to a lesser extent, canine (10%) and bovine species (10%). Requires satisfactory completion of 3rd year of professional program and clinical theriogenology senior rotations.
VMC 942 Principles of Medicine 2.  
Prerequisite: 2nd year DVM student.  
This cross-species course provides an introduction to the principles of disease and injury state common to all species. Content in this course is intended to prepare the students for third year DVM medicine and surgery courses.

VMC 943 Laboratory Animal and Zoological Species Health and Disease I 1.  
P: Admission to professional veterinary program.  
Principles of applied biology, management, physical examination, and medical techniques, health problems and medical treatment of laboratory and companion fishes, amphibians, and reptiles will be presented. Laboratory sessions will include handling of live animals, examination of necropsy specimens, and case discussions. Students must be enrolled in the Doctor of Veterinary Medicine program.

VMC 944 Introduction to Clinical and Professional Communication 1.  
Corequisite: Current enrollment in DVM program.  
The ability to communicate with clients is important to successful veterinary practice. The focus of this course is to explore how to effectively communicate with clients in a clinical context. Students will develop verbal and nonverbal communication skills, an understanding of relationship-centered care, management of client interactions, getting informed consent, and communicating complex information. Examples and cases from veterinary medicine will guide application of clinical communication in context.

VMC 948 Clinical Rotation in Veterinary Radiation Oncology 2.  
Prerequisite: VMB 960.  
This is an elective rotation during the 4th year of CVM professional studies providing an introduction to veterinary radiation oncology. Basic information about radiation therapy equipment, treatment planning and delivery, and outcome of patients treated for various cancers with radiation therapy will be emphasized. Students will be assigned cases being seen by the radiation oncology service as inpatients, outpatients, and new referral appointments.

VMC 949 Equine Primary Care 4.  
Prerequisite: 4th year DVM student.  
This 4 week course will provide students with an initial one week of intensive clinical experience in equine primary care and three weeks with a NCSU CVM approved equine primary care practice. Students will be seeing a variety of primary care cases from CVM staff and faculty owned horses, state owned horses, and horses from non-profit organizations during the first week at Southern Pines; including vaccinations, dentistry, lameness, imaging, nasogastric intubation, and field surgery. This course is not an externship and students will have outcome assessments from the instructor as well as the veterinarian at the equine primary care practice. During the final three weeks, students will be exposed to a general equine primary care practice. Students will be expected to examine cases, discuss differentials, provide a treatment plan, perform treatments, and provide client communication. Instructor approval for enrollment required.

VMC 950 Sea Turtle Medicine and Rehabilitation 2.  
Prerequisite: 4th year DVM student.  
This course provides practical experience in husbandry and disease diagnosis and treatment in rehabilitating sea turtles at the Karen Beasley Sea Turtle Rescue and Rehabilitation Center (KBSRRC) in Topsail Beach, NC. Skills to be acquired in clinical and didactic setting include sea turtle husbandry and rehabilitation techniques, diagnostic sample collection and interpretation, physical examination and safe handling, medication delivery, wound treatment, and necropsy protocols.

Prerequisite: Successful completion of the 2nd year of the professional curriculum.  
Overview of medical and surgical management of selective metabolic, neoplastic, nutritional, immune-mediated, developmental and degenerative diseases of companion animals.

VMC 952 Equine Medicine and Surgery 3.  
Medical conditions in large domesticated animals are presented in this course. Discussions involve the agents causing diseases and the therapeutic methods used to correct. 3 semester hours.

VMC 953 Laboratory Animal and Zoological Species Health and Disease II 3.  
Principles of applied biology, management, physical examination and medical techniques, health problems and medical treatment of laboratory animals, small companion mammals and zoological species will be presented. Laboratory sessions may include handling of live animals, examination of necropsy specimens, and case discussions. Laboratory Animal and Zoological Species Health and Disease II will focus on avian and mammalian species. Students must be enrolled in the Doctor of Veterinary Medicine program.

Prerequisite: Senior DVM student.  
Small animal medicine clinical rotation emphasizing the disciplined detection, prioritizing and planning for therapy of medical diseases in small companion animals. Development of medical judgment and the use of the problem oriented medical record is stressed. This course is intended for DVM students in the food animal focus area.

VMC 955 Extramural Experiences in Lab An Med 2.  
Corequisite: Current enrollment in DVM program.  
DVM students will have the opportunity to undertake a two-week rotation in an approved laboratory animal facility under the supervision of a laboratory animal veterinarian. This opportunity will meet the need to increase “hands-on” experience as part of the focus area requirements or recommendations.

VMC 957 Introduction to Clinical Practice 1.  
Corequisite: Current enrollment in DVM program.  
This course has 4 components: a surgery laboratory, a clinical skills laboratory, a communication and wellness case-based facilitated session and community-based experiences. Taken together, these experiences are designed to give students practice and confidence in skills related to small animal general practice.

VMC 958 Advanced Prosimian Medicine 2.  
Prerequisite: VMC 991, restricted to 4th year DVM students.  
This course is designed to provide senior veterinary students with clinical experience in prosimian medicine. Students will gain practical experience in the diagnosis, treatment, and prevention of disease in captive prosimians maintained in research facilities. Students participate in formal rounds, autodidactic exercises, and case management at the Duke Lemur Center. Limited to 4th Year DVM curriculum students.

VMC 959 Advanced Primate Medicine 2.  
Prerequisite: VMC 991 Primate Medicine.  
This course is designed to provide senior veterinary students with clinical experience in nonhuman primate medicine. Students will gain practical experience in the diagnosis, treatment, and prevention of disease in captive research primates maintained in research facilities. Students participate in formal rounds, autodidactic exercises, and case management at Primate Center at Wake Forest University. Limited to 4th year DVM curriculum students.
VMC 960 Small Animal Emergency Service 2.
Prerequisite: fourth year clinics student, DVM student.
Assessment, triage, and management of canine and feline patients admitted to the small animal emergency service after hours.

This course is an overview of medical and surgical management of selected metabolic, neoplastic, nutritional, immune-mediated, developmental, and degenerative diseases of companion animals. 4 semester hours.

VMC 963 Extramural Experience in Zoo Medicine 2.
Requisite: Currently enrolled DVM student.
This elective senior year rotation allows students to obtain clinical, laboratory, field, and research experiences in zooological medicine that augment the basic rotations in the zoological medicine focus area. Students can customize their training through participation in a variety of opportunities including epidemiology projects, other basic or clinical research projects, and externships involving captive and free-ranging wildlife & zoo species. does not fulfill senior year requirement for elective credit in Zoo Focus Area.

VMC 964 Zoological Husbandry and Nutrition 2.
Prerequisite: Successful completion of 3 Zoological Medicine Selectives or course coordinator permission.
This course is designed to provide senior veterinary students with husbandry and background experience in a zoo setting as a foundation for health management. Students will gain practical experience in the husbandry and nutrition of zoo animals while learning the importance of prevention of disease in captive wildlife. Students participate in formal rounds, autodidactic exercises, and hands on animal care delivery.

VMC 965 Advanced Principles of Surgery 1.
Prerequisite: DVM student, Completion of fall semester, VM3 students. This laboratory includes induction and maintenance of anesthesia in representative companion animal, food animal, and equine species; the practice of surgery on anesthetized animals and cadaver specimens; and experience with diagnostic and therapeutic techniques. Students examine, assess, and provide preoperative, intraoperative, and postoperative management of their patients.

VMC 966 Equine Emergency and Critical Care 2.
Prerequisite: 4th year DVM student, Third year veterinary curriculum. An intensive course in the assessment and management of equine emergencies. This would include evaluation of patients, surgical and medical treatment of in house and emergency critical care patients, and post-operative assessment and management. Students will gain valuable practical experience of critically ill patients and rounds will be held daily to ensure a high level of learning.

VMC 967 Clinical Veterinary Dentistry 2.
Will participate in examination, admission, diagnosis treatment, discharge, and follow-up of patients in dentistry service. Take a clinical history, perform a physical examination, develop appropriate diagnostic plan, discuss the plan with the service's clinicians, and participate in formulation of treatment protocol. Service treats patients Monday-Thursday, Friday reserved for overflow, emergencies, research and teaching. Students given prepared lectures on dental procedures and diseases, and will be allowed to perform supervised procedures on cadavers. (No animals euthanized for this purpose.).

VMC 968 Equine Orthopedic Surgery and Lameness 2.
Prerequisite: DVM student, Completion of 3rd year veterinary curriculum. Application of problem solving skills and the art, science, and practice of equine orthopedic surgery and lameness in the veterinary teaching hospital setting.

VMC 969 Equine Podiatry 2.
Prerequisite: 4th yr. standing in the veterinary curriculum at the CVM, Successful completion of 3rd yr. of Veterinary Curriculum. Two-week clinical block in equine podiatry clinic Tuesday, Wednesday, and Thursday, with guided independent clinically applied study Monday and Friday.

VMC 970 Companion Animal and Special Species 2.
Prerequisite: Fourth year student in the professional curriculum at The College of Veterinary Medicine.
Students on this rotation will have the opportunity for more direct animal experience than they have previously had. They will be exposed to the needs of shelter animals and the care of large populations of dogs and cats. The mobile unit will be used for the provision of off-site medical and surgical care, but will be staffed with student volunteers. The Wake County Animal Shelter is serving as the intake facility for all relinquished animals in Wake County.

1. Obtain a thorough history and perform a complete physical examination. 2. Identifying, defining, and prioritizing problems. 3. Developing and initiating rational diagnostic and therapeutic plans. 4. Performing certain diagnostic and therapeutic procedures. 5. Interpreting results of diagnostic tests, and determining their importance to the patient. 6. Verbal and written communication with clinicians, clients, veterinary techniques, fellow student veterinarians, and referring veterinarians. 7. Determining the point at which it is time to refer a case to a colleague for another look, or to a referral center for specialized diagnostic testing or treatment. 8. Understanding how cases management in private practice compares with referral practice. 9. Approaching issues regarding euthanasia; your decision-making, assisting the owner.

VMC 972 Clinical Small Animal Veterinary Cardiology 2.
Prerequisite: 4th yr. standing in the veterinary curriculum at the CVM, Successful completion of 3rd yr. of Veterinary Curriculum. Two-week clinical rotation to provide senior veterinary student training in diagnostic and therapeutic aspects of veterinary small animal cardiology. Clinical experience with patients and clients of Veterinary Teaching Hospital and topic and case review rounds.

VMC 973 Small Animal Surgery 2.
Prerequisite: Completion of third year veterinary curriculum. Clinical rotation on the small animal surgery services. Students will be assigned to one of two services, general surgery or orthopedic surgery. Students see cases and assist with care of small animal surgical patients. Students will be on-call to assist with emergency surgery cases.

VMC 975 Equine General Surgery 2.
Prerequisite: DVM student, Completion of 3rd year veterinary curriculum. Application of problem solving skills and the art, science, and practice of equine general surgery in the veterinary teaching hospital setting.

VMC 976 Veterinary Critical Care 2.
Prerequisite: 4th year DVM student. Assessment and management of companion animal emergency and critical care patients, including several 'hands on' laboratories using cadavers to learn and practice emergency and critical care techniques. Principles of emergency and critical patient evaluation, stabilization, and organ system support are the focus of the course. Out-rotations at area emergency clinics are required. Open only to 4th year students in the small animal focus area.
VMC 977 Equine Preventative Health Care 2.
Prerequisite: Completion of 3rd year in veterinary curriculum.
Perform routine preventative health care procedures for the horse in a field setting.

VMC 978 Equine Lameness 2.
Prerequisite: DVM student, Completion of the third year of the veterinary curriculum.
Development and use of problem solving skills and techniques for diagnosis, treatment, and management of lameness in horses.

VMC 979 Equine Medicine 2.
Students are responsible for all aspects of patient care and are expected to be dedicated to their patients. Frequent and careful observation of the patients, attention to detail, diligent record keeping, accuracy in formulating and carrying out a treatment plan, and use of common sense are expected. The earlier you note potential problems, the earlier and easier they can be resolved. Irresponsibility, carelessness, lack of accuracy, untruthfulness, or a poor attitude will not be tolerated.

VMC 980 Vet Clin Oncology 2.
This is a two-week, two credit elective rotation during the 4th year of CVM professional studies providing experience in the diagnosis and treatment of cancer in animals. Emphasis is on development of comprehensive cancer management strategies including ethical considerations, diagnostic techniques, treatment options, and client communication skills. Students will be assigned cases being seen by the oncology service as inpatients, outpatients, and new referral appointments.

VMC 981 Lab Animal Medicine 2.
The block will provide practical experience in the diagnosis, treatment and prevention of diseases of laboratory animals. It will include special study of diseases of laboratory animals and the management of laboratory animal facilities. Opportunity to perform surgical procedures on common laboratory animals will be provided in a series of surgical labs. There will be field trips to other laboratory animal resource facilities within the Research Triangle Park and surrounding areas. The student will present a seminar on a selected topic for critical appraisal by students and faculty.

VMC 982 Ophthalmology 2.
The purpose of the ophthalmology course is to acquaint the student with examinations, diagnostics and therapeutic practices, and principles of clinical veterinary medicine. There will be direct supervision by faculty and house officers. Attendance is required at weekly clinical rounds, general medicine rounds, and the patient rounds and mini-seminars conducted within the service. Irregular and/or long hours may be required. Students will be expected to be neatly dressed, well groomed, and conduct themselves in a professional manner at all times.

VMC 983 Dermatology 2.
Dermatological disease will represent a significant proportion of your case load, particularly in companion animal practice. Most of the patients that you will see have chronic relapsing disease that can be frustrating, and often costly for the owner. Therefore, whilst an accurate diagnosis represents the first step in dealing with a case, the challenge in this field of medicine is to successfully manage cases in the long term. This requires good and open communication with the client as well as regular patient evaluation. Most of the diagnostic techniques employed in dermatology are very simple and do not require expensive equipment or excessive amounts of time. The key to successful dermatological practice is to use these tools appropriately to recognize conditions such as parasitic infestations and bacterial or yeast infections for which there is a specific course of treatment. It specializes in the diagnosis and management of chronic ear disease and immunological dermatoses such as autoimmune ski.

VMC 984 Intro Clin Neuro 2.
This course provides diagnosis and management of nervous system disorders in animals, including nuclear imaging, myelography, CT scans, electromyography, neurosurgery, and postoperative patient rehabilitation including hydrotherapy and treadmill training. Attendance is required at weekly clinical rounds, general medicine rounds, and the patient rounds and mini-seminars conducted within the service. Irregular and/or long hours may be required. Students will be expected to be neatly dressed, well groomed, and conduct themselves in a professional manner at all times.

VMC 985 Avian and Reptile Medicine 2.
Prerequisite: 4th year standing in the veterinary curriculum at the CVM, VMC 953, VMF 964.
The medicine of companion and wild birds and reptiles (turtles, lizards & snakes) will be taught using clinical cases in the Veterinary Teaching Hospital and field service visits to avicultural and herpetological collections. Emphasis will be on proper restraint and handling, physical examination, diagnostic sample collection and routine treatment procedures. A problem orientated approach will be used for all clinical cases.

VMC 986 Adv Com An Int Med 2.
This course provides a higher level experience to diagnosis and management of companion animals with complex medical problems. Students may choose to concentrate on particular aspects of internal medicine. Students are not required to participate in emergency/intensive care unit duty.

VMC 987 Aquatic Medicine 2.
This course is designed as an elective clinical block rotation in field services, in the final year of the professional DVM curriculum. Students electing the course would have successfully completed the two theoretical/laboratory courses in special species medicine providing the foundation for participation in this course. It is the only clinical course offering hands on experience with medical care delivery to aquatic species.

VMC 988 Exotic Animal Medicine 2.
This clinical rotation provides practical experience in the diagnosis, treatment and prevention of disease in privately owned small mammals, birds, reptiles, fish, and amphibians. In addition to assisting with the management of clinical cases, students will participate in daily teaching rounds, laboratory activities to increase their technical proficiency, and field visits to various exotic animal collections in NC. Presentation of a short seminar on a clinically relevant topic is required. Irregular and/or long hours, including on-call duty for after-hours emergencies, may be required.
VMC 989 Zoological Medicine 4.
Prerequisite: VMC 964 or successful completion of 3 Zoological Medicine Focus Selectives; and Course Coordinator's Permission.
This course is designed to introduce the senior veterinary students to clinical zoological medicine. Students will gain practical experience in the diagnosis, treatment, and prevention of disease in captive zoological specimens maintained in zoos. Students participate in formal rounds, autodidactic exercises, and case management at the N.C. Zoological Park.

VMC 990 Musculoskeletal Ultrasound in the Horse 2.
Prerequisite: VMC 975.
Develop and use problem solving skills during management of clinical cases incorporating diagnostic ultrasound in a number of different clinical situations. Physics of ultrasound and the resultant sound beam-tissue interactions, mainly musculoskeletal diagnostic ultrasound.

VMC 991 SP Top in DOCS 1.
Corequisite: Current enrollment in DVM program.
One week special topic course in the Department of Clinical Sciences.

VMC 992 SP Top in DOCS 1-4.
Two week special topic course in the Department of Clinical Sciences.

VMC 993 Special Problems Equine Medicine and Surgery 2.
This course is offered to students that have already signed up to take any two of the following courses: Preventive Health Care, Equine Medicine, Equine Surgery, or Equine Theriogenology. The course is designed to give additional experience in equine-oriented clinical services at NCSU. Students will not be able to participate in this block off campus, unless working directly with a NCSU faculty member. A faculty mentor must be identified within one month of signing up for this course and a written proposal of activities planned submitted to Dr. Gardner.

VMC 994 Small Animal 4th Year Extramural Studies 1-6.
This course is a recommended rotation designed to expand opportunities for senior veterinary students to participate in small animal private practice a) enhance and learn clinical and technical skills, b) develop effective client communication skills and time management, and c) observe elements of small business management, including personnel involved and professional financial interactions with private clients. Students will work at a private or corporate veterinary practice under the direct supervision of a licensed veterinarian engaged in small animal practice. Must be senior student in the DVM program.

VMC 995 Clinical Conference 1.
Each senior student is required to do a 25 minute presentation during their senior year. The presentation may involve a case report, series of cases, or epidemiological study. Retrospective study of a disease or syndrome including data drawn from other institutions or published findings may be used as well as topics of general interest to veterinary medicine of an innovative nature.

VMC 996 Advanced Avian Clinical Medicine 2.
P: VMC 988.
Students will work with teaching birds to develop skills in avian handling, diagnostic sample collection, anesthesia and radiology. Cadavers will be used to teach orthopedic and soft tissue surgical procedures. Students and faculty will spend approximately 5 days in the field, working with psittacine birds, waterfowl and raptors at Sylvan Heights Waterfowl park in Scotland Neck, NC and at the Carolina Raptor Center in Charlotte, NC. Restricted to senior DVM students.

VMC 997 Raptor Medicine and Rehabilitation 2.
This elective senior year rotation allows students to obtain clinical experience in raptor medicine and rehabilitation at Carolina Raptor Center in Charlotte, N.C. Students will develop skills with species identification, capture and handling, physical examination, bandaging, diagnostic sample collection and interpretation, emergency stabilization and treatment techniques, necropsy, anesthesia and surgery assistance, and captive management and husbandry issues. A maximum of 2 students will be permitted in each 2-week clinical rotation. For students enrolled in DVM Curriculum. Will partially fulfill senior year requirement for elective clinical rotation credit in Zoo Focus Area.

VMC 998 Basic Wildlife Rehabilitation Medicine 2.
Prerequisite: VMC 964 or successful completion of 3 Zoological Medicine Focus Selectives, VMC 998, and Course Coordinator's Permission.
Wildlife rehabilitation medicine, the delivery of health care and management to free-ranging native wildlife with the goal of re-release is an important component of clinical veterinary medicine. Students in this basic course will work with instructors to learn to apply practical medical and surgical techniques and methods for diagnosing disease, delivering health care, and implementing appropriate triage for injured and ill North Carolina native wildlife. Restricted to DVM Curriculum 4th year students.

VMC 999 Advanced Wildlife Rehabilitation Medicine 2.
Prerequisite: VMC 964 or VMC 998.
Wildlife rehabilitation medicine, the delivery of health care and management to free-ranging native wildlife with the goal of re-release is an important component of clinical veterinary medicine. Students in this advanced course will apply practical medical and surgical techniques and methods learned in the basic course for diagnosing disease, delivering health care, and implementing appropriate triage for injured and ill North Carolina native wildlife. They will assist staff and faculty in managing cases native to North Carolina.

Veterinary Public Health (VPH)
VPH - Veterinary Public Health Courses

Veterinary Science - VMP (VMP)

VMP - Veterinary Science - VMP Courses

VMP 162 Livestock and Poultry Disease Management 3.
Basic principles of disease and disease management in livestock and poultry. Disease prevention through sanitation and vaccination. Diseases of horses, pigs, ruminants, poultry, and disease prevention programs for each species.

VMP 401 Poultry Diseases 4.
Concepts of factors contributing to or causing disease, disease cycle, host responses, and general approaches to prevention and control including management and biosecurity methods, immunization, and medication. Recognition, diagnosis, prevention, control, and treatment of economically significant infectious and noninfectious diseases affecting poultry.

VMP 420 Disease of Farm Animals 3.
Prerequisite: Junior standing.
Pathology of bacterial, viral, parasitic, nutritional, thermal and mechanical disease processes for farm animals. This emphasis practices for prevention and control of each disease.
VMP 907 Cancer Pathogenesis and Diagnosis 1.
Prerequisite: 3rd year DVM student.
This course will enable the student to describe the steps that lead from a normal cell to a fully malignant neoplasm, understand underlying molecular mechanisms, and correlate these mechanisms to relevant treatment options. Students will be able to classify different tumor types and deduce the impact of the neoplasm on the host and host responses. Students will also learn to assess clinical samples to make a relevant clinical diagnosis of tumor type and predicted behavior.

VMP 909 Veterinary International Elective Experience 1-2.
Corequisite: Current enrollment in DVM program.
This course will provide students with practical experience in a foreign country working on a veterinary medicine related project being conducted in that country. Projects may focus on production medicine, occupational, zoological medicine, or basic research. Travel restricted to sites not included on the State Department alert/warning list. See http://travel.state.gov/content/passports/english/alertswarnings.html for details.

VMP 910 Infection and Immunity 1 3.
Prerequisite: Admission to the DVM Curriculum.
This course is intended to familiarize the student with the pathogenic bacteria and fungi of veterinary importance. The student will learn the properties and cultivation of these microorganisms and receive a general introduction to the diseases they can cause. Primary emphasis will be placed on how the biology of the pathogen influences disease pathogenesis, and microbiological identification of infectious agents. The laboratory exercises will complement the lectures and focus on standard procedures for microbial cultivation and identification.

VMP 916 Health Maintenance and Animal Production I 1.
This course is part I of a series with VMP 936 and 956 designed to introduce students to procedures for health maintenance and care of horses and food-producing animals. Students learn how to prevent diseases and promote animal health in laboratories.

VMP 920 Infection and Immunity 2 4.
Prerequisite: Admission to the DVM Curriculum.
This course is intended to continue the topics introduced in Infection and Immunity 1. Specific bacterial, fungal and viral pathogens will be covered including pathogenesis and strategies used to control infection and/or development of disease. The course will also cover more advanced topics in immunology including the types of hypersensitivities, autoimmunity, immunity in the newborn and fetus, immune deficiencies and vaccination.

VMP 921 Problem Solving for Cases in Infectious Diseases and Immunity 1 2.
Prerequisite: Admission to the DVM Curriculum.
This course is intended to challenge first-year veterinary students to reach a diagnosis of realistic cases involving either infectious diseases or immune pathology. The first part of the course is an introduction to diagnostic laboratory procedures. The second portion of the course requires the students to develop a list of differential causes to assigned clinical cases, choose a presumptive diagnosis based on available data and ordering of diagnostic tests to confirm the presumptive diagnosis. The individual cases are discussed in a small group format with a faculty facilitator.

VMP 922 Small Group Problem Solving in Veterinary Medicine 1.
Students will work in small groups with a faculty facilitator to examine case scenarios, and apply the problem-solving process discussed in VMB 912 to a variety of clinical and research problems. This course will provide a venue for integration of content presented in other courses, as well as application of small-group communication skills. Course limited to students enrolled in the DVM curriculum.

VMP 930 Infection and Immunity 3 3.
Prerequisite: Admission to the DVM Curriculum.
Infection and Immunity 3, VMP 93X, is designed to serve as a continuation of Infection and Immunity 1 & 2 (first-year curriculum) for the second-year veterinary student. This course is designed to reinforce principles if infectious disease and immunity introduced in the first year of the DVM curriculum and expand upon specific groups of parasites. This course will cover the diagnosis, treatment and control of major endo and ecto parasites of domesticated animals.

VMP 931 Veterinary Pathology I 3.
Introduction to the basic pathologic changes which occur in animal tissues. Developmental processes and resulting morphology observed at gross, cellular, and subcellular level emphasized.

VMP 934 Problem Solving for Cases in Infectious Diseases & Immunity 2 2.
Prerequisite: Admission to the DVM Curriculum.
This course is intended to challenge first-year veterinary students to reach a diagnosis of realistic cases involving either infectious diseases or immune pathology. The first part of the course is an introduction to diagnostic laboratory procedures. The second portion of the course requires the students to develop a list of differential causes to assigned clinical cases, choose a presumptive diagnosis based on available data and ordering of diagnostic tests to confirm the presumptive diagnosis. The individual cases are discussed in a small group format with a faculty facilitator.

VMP 936 Health Maintenance and Animal Production II 1.
Prerequisite: VMP 916.
This course is part II of a series with VMP 916 and 956 designed to introduce students to procedures for health maintenance and care of horses and food-producing animals. Students learn how to care for animals, prevent diseases, and milk cows in laboratories.

VMP 941 Veterinary Pathology II 4.
Corequisite: Current enrollment in DVM program.
Systemic Pathology - A study of specific responses of organ systems to pathogenic influences in animals with emphasis on the effects on the body as a whole.

VMP 942 Veterinary Clinical Pathology 3.
Introduction to the mechanisms which produce abnormal physiologic parameters within the animal during illness, with emphasis on the techniques for determining those abnormalities in the living animal.

VMP 945 Epidemiology & Public Health 3.
Prerequisite: VMP 912, DVM student.
The focus of this course is to construct a foundation for clinical medicine by acquiring a holistic view of disease, exploring optimal preventive medicine strategies while developing a critical thinking skills and quantitative reasoning techniques. The teaching/learning format of the course will include lecture, in-class exercises, discussions and case studies.
VMP 956 Health Maintenance and Animal Production III 1.
This course is part III of a series designed to instruct students in procedures for maintaining the health and well-being of horses and food-producing animals. Students learn how to prevent diseases and promote animal production, including production of safe meat and milk.

VMP 962 Ruminant Medicine 2.
The principles of medical disorders of ruminants are presented. This includes the cause of the disorders and the diagnostic, therapeutic and prophylactic measures necessary to correct, reduce or prevent these problems.

VMP 964 Swine and Poultry Medicine 3.
Lecture series supplemented with projected illustration on the most economically important diseases of poultry and swine. Emphasis is placed on definition of diseases, etiology, characteristics of the disease, and diagnosis. The economics related to occurrence, prevention, treatment, and control are presented.

VMP 970 Ruminant Health Management I 2.
Prerequisite: VMP 956 or VMP 974 or consent of the instructor.
This is a two-week block considering health management of ruminant species. During the two-week period, students accompany faculty on visits to farms to deliver health management programs, to investigate health problems, or to consider approaches to enhance productivity. A portion of the course also involves experience in providing individual animal health management and addressing medical/surgical disorders. Available to senior veterinary students.

Prerequisite: Prior undergraduate coursework, summer work experiences, and/or consistent enrollment and good performance in food animal selectives.
This course is intended to instruct food animal veterinary students in: 1) underlying principles of veterinary diagnostic assays, 2) proper collection of samples, 3) effective testing approaches for diagnosis and management of disease, 4) strategies for efficient monitoring of food animal population for infection by specific agent(s), and 5) analysis of data from veterinary diagnostic laboratory tests and optimal use of the results for making production management decisions. Priority given to students in Food Animal Focus area. Students in Mixed Animal Focus Area or special-case Epidemiology Focus Area students can enroll (if space remains) with the approval of Course Coordinator if they meet the criteria states in the above requisites.

VMP 972 Ruminant Health Management II 2.
Prerequisite: VMF 970.
Senior veterinary students will experience advanced training in ruminant clinical medicine.

VMP 973 Special Topics in Epidemiology 2.
The main goal of this course is to provide senior veterinary students with the opportunity for pursuing a focused research topic in the area of veterinary epidemiology and population medicine under the direction of consenting faculty. The exact direction and scope of the topic is agreed upon between the instructor, the student and the course coordinator. The course is offered only by the approval of the participating instructor(s) and the course coordinator. The instructor and the student will work out the type of project, what exact objectives are to be met and how the success of obtaining those objectives will be evaluated. The objectives and methods of evaluation of performance will be negotiated between the veterinary student and the instructor and put into writing in the form of a Plan of Action PRIOR to course permission being granted by the course coordinator. The Plan of Action must be signed by both the instructor and the course coordinator at least 8 weeks prior to the beginning of the rotation. No.

VMP 974 Food Supply Veterinary Medicine 2.
Prerequisite: Completion of first 3 years of veterinary curriculum; consent of instructor for any enrollment >8.
This 2-week course provides exposure to the clinical principles of food supply veterinary medicine. It is primarily intended for individuals who are not in the NCSU-CVM Food Animal Focus Area. Ruminant, swine and poultry faculty provide an overview of the animal industries and production practices, as well as exposure to basic veterinary knowledge and clinical skills. Prerequisites may include consent of instructor.

VMP 975 Advanced Topics in Veterinary Anatomic Pathology 1-6.
Prerequisite: VMP 977.
This is a two-week senior veterinary clinical rotation that provides students with additional, focused experience in veterinary anatomic pathology. Students have the option of rotating through necropsy service and surgical biopsy service for two weeks to gain additional experience in pathology similar to VMP 977, the prerequisite for this course. Students will have the option of designing a specialized pathology experience with the guidance of an approved pathology faculty member. Enrollment requires pre-approval by faculty assigned to the course.

VMP 976 Food Animal Pharmacology 2.
Prerequisite: VMB 943; VMP 962; VMP 964.
This course will outline the basic principles of pharmacology and therapy of the major diseases of ruminants, swine and poultry. Students will be expected to develop a thorough understanding of how properly to use drugs in food animal species and should be able to develop a treatment program for most major livestock diseases. The course will be restricted to students in the food animal and mixed animal focus areas.

VMP 977 Autopsy/ Clinical Pharmacology 2.
Two clinical disciplines are completed during this clinical block - Autopsy Pathology and Clinical Pharmacology. The autopsy clinical rotation provides exposure to pathology techniques, observation skills and medical reasoning used to obtain and interpret autopsy and laboratory data in order to develop diagnoses, understand disease processes and address clinical and/or farm problems. The clinical pharmacology portion of the rotation will expose the students to current veterinary clinical pharmacology and therapeutics.

VMP 978 Clinical Pathology, Laboratory Medicine and Nutrition 2.
This course provides veterinary students with a practical case-based approach to learning all major aspects of veterinary clinical pathology, laboratory medicine (parasitology, immunology, virology, bacteriology) and nutrition in a clinical setting. It is restricted to students enrolled in the fourth year of the DVM curriculum.
VMP 979 Epidemiology 2.
The main goal is to provide senior veterinary students with the opportunity for pursuing a focused research topic in the area of veterinary epidemiology and population medicine under the direction of consenting faculty. The exact direction and scope of the topic is agreed upon between the instructor, the student and the course coordinator. This course is offered only by the permission of the participating instructor(s) and the course coordinator. The instructor and the student will work out the type of project, what exact objectives are to be met and how the success of obtaining those objectives will be evaluated. The objectives and methods of evaluation of performance will be negotiated between the veterinary student and the instructor and put into writing in the form of a Plan of Action PRIOR to course permission being granted by the course coordinator. No one textbook is required for this course.

VMP 980 Theriogenology I 2.
Prerequisite: Enrolled in fourth year clinical rotations.
This course is designed to instruct students in clinical Theriogenology. It will be primarily oriented toward equine and canine species, however, cases and problems from other species will be seen and included as teaching materials. The students will improve upon the skills learned in VMF 951 and will be expected to use these skills in dealing with clinical cases and laboratory type situations. Transabdominal, vaginal, and rectal examination of the reproductive tract, semen collection, and evaluation will be taught during this course. This course may be repeated as many times as a student wishes during their senior year.

VMP 981 Special Topics in Theriogenology 2.
The primary objective of this course is to provide additional information and training to veterinary students that had taken the VMP 980 Clinical Theriogenology senior clinical rotation. Specifically, emphasis is directed to acquaint students with modern and current practices of clinical Theriogenology. Various aspects of assisted reproductive technology available to domestic animals will be discussed. It is expected that the majority of the information and activities offered in this course will involve equine species (80%) and, to a lesser extent, canine (10%) and bovine species (10%). Teaching and client-owned animals are available for the rotation. Although emphasis is given on hands-on activities, didactic instruction of selected topics in clinical Theriogenology will be discussed.

VMP 982 Poultry Health Management I 2.
Poultry Health Management I is a clinical rotation elective for 4 th year veterinary students with an interest in poultry health management or food animal production. This two-week course is offered 4 times each year. Diseases of turkeys and chickens will be discussed. Basic concepts in poultry disease diagnosis, prevention and treatment will be emphasized. The course will consist of lectures, laboratory and field experiences.

VMP 983 Poultry Health Management II 2.
Poultry Health Management II is a clinical rotation elective for 4 th year veterinary students with a commitment to pursue a career in poultry health management or food animal production. This two-week course is offered throughout the year and may be repeated with permission of the instructor. The course will consist of laboratory and/or field experiences designed to meet the student’s career goals. A list of available externships in poultry health management, which may be applicable for this course can be found on the Association of Avian Pathologists web site: http://www.aaap.info/index.html, under Educational Opportunities, Senior Veterinary Student Externships approved by the Kenneth Eskeland Preceptorship Committee. Funds to help pay for travel expenses may be available through the Kenneth Eskeland Preceptorship, see information at the web site listed above.

VMP 984 Swine Health Management I 2.
This course will provide senior veterinary students with techniques and expertise to approach a clinical swine problem. Students will evaluate clinical signs, analyze production records, assess facilities and management, institute a diagnostic plan and establish an economically feasible solution to the clinical problem. The outline for this course may vary slightly from year to year but the following topics will be covered: Necropsy procedures/sample techniques; Interpreting serologic/virologic results; Farm visits - review building/equipment designs; Practical swine reproductive management; Practical bacteriology; Practical swine nutrition/ration; Swine record systems/Pig Champ.

VMP 985 Swine Medicine & Production II 2.
This course will provide senior veterinary students with the opportunity to utilize the techniques and expertise gained in VMP 984. Students will evaluate clinical and production problems on a variety of swine farms. Practicum/field work and independent study will be conducted on commercial swine farms, usually with a veterinary practitioner or faculty member.

VMP 986 One Health: From Philosophy to Practice 2.
Graduate/professional seminar (with team project) addressing intersections of veterinary medicine, human medicine, and environmental health. Co-listed at UNC CH Gillings School of Global Public Health and Duke University School of Medicine. Includes participants from these three institutions, plus related private-sector members, non-governmental organizations, and governmental professionals. Its purpose is to facilitate understanding of one health as a system of systems, and promote cross-campus and cross-discipline interactions. Weekly evening course held at NC Biotechnology Center, RTP. Limit: 15 students per university. Requires current graduate standing at NCSU or professional student standing within the College of Veterinary Medicine.

VMP 987 Ruminant Topics 2.
This two-week elective allows goal-directed educational enrichment in Ruminant Practice under the direction of consenting faculty. Formats include clinical experiences, clinical and applied investigations, etc. Topics and times are arranged by the student and consenting faculty. Available to 3 rd and 4 th year veterinary students only upon consent of faculty. VMF 970 may be a required prerequisite.

VMP 990 Large Animal Community Classroom 2.
Senior DVM students will have the opportunity to undertake an elective rotation in an approved practice externship in a large animal practice a) food animal/rural or b) equine/mixed animal. The practice opportunity will meet the need recognized by students, CVM faculty and private practice colleagues alike to increase "hands on" experience in a private practice setting. Private practice experiences are available for year 1 - 3 students through the selective offerings. Presently, senior students have the opportunity to experience private practice by arranging an externship as an elective. However, initiating an elective course will ensure consistency between experiences, with clear expectations to achieve an approved level of learning/skills objectives with verification from the practice. Practitioners will be valuable partners in the education process in the senior year, providing access to individual animal and herd-related clinical diversity that is increasingly difficult to offer in the academic setting.

VMP 991 SP Top in PHP 1.
One week special topic course in the Department of Population Health & Pathobiology Department.

VMP 992 SP Top in PHP 1-2.
One week special topic course in the Department of Population Health & Pathobiology Department.
VMP 994 Extramural Experience in Pathology 1-4.
This is a two-week externship experience in pathology. The student will arrange an extramural experience in an academic, diagnostic, government, industrial, or zoological/wildlife laboratory setting under the supervision of a board certified veterinary anatomical or clinical pathologist. Fourth year DVM students only.

VMP 995 Clinical Conference 1.

VMP 999 Vet International Field Studies 2.
This course will provide students with practical experience in a foreign country working on a veterinary medicine related project being conducted in that country. Projects may focus on production medicine, occupational safety, zoological medicine, or basic research.

Visual and Performing Arts (VPGE)

VPGE - VPGE Courses

VPGE 295 Visual and Performing Arts Special Topics 3.
Special topics course offering for the general education Visual and Performing Arts category.

Visual and Performing Arts and Glob Know (VPGK)

VPGK - VPGK Courses

VPGK 295 Visual and Performing Arts and Global Knowledge Spec Topics 3.
Special topics course offering for the general education Visual and Performing Arts and Global Knowledge categories. This course may be used for the Global Knowledge (GK) co-requisite and/or for the Visual and Performing Arts (VPA) requirement.

Visual and Performing Arts and U.S. Div (VPUS)

VPUS - VPUS Courses

Special topics course offering for the general education Visual and Performing Arts and U.S. Diversity categories. This course may be used for the U.S. Diversity (USD) co-requisite and/or for the Visual and Performing Arts (VPA) requirement.

Women's and Gender Studies (WGS)

WGS - Women's and Gender Studies Courses

WGS 200 Introduction to Women's and Gender Studies 3.
Introduction to women's and gender studies as an interdisciplinary field spanning the humanities, social sciences and natural sciences. Study of historical perspectives and contemporary understanding of men and gender. Theory, systematic analysis and experimental accounts used to explore complexities of gender, and other identity determinants, mechanisms of power and privilege, and avenues for social change.

WGS 204 Sociology of Family 3.
Contemporary American family structures and processes and their development. Focus on socialization, mate selection, marital adjustment and dissolution. Includes core sociological concepts, methods, theories.

WGS 210 Women and Gender in Science and Technology 3.
Interdisciplinary introduction to the reciprocal relationships between scientific/technological research and contemporary understanding of gender. Special emphasis on social factors influencing scientists and engineers in their professions.

WGS 220 Men and Masculinity 3.
An introduction to the study of men and masculinity as an interdisciplinary field spanning the humanities and social sciences. This course will draw on both historical perspectives and contemporary understanding of men and masculinity, with attention to key domains of men's lives such as the roles of men in fiction and film, race and masculinity, religion and masculinity, fatherhood, masculinity and sports, and male sexuality.

WGS 224 Contemporary Issues in Ecofeminism 3.
Contemporary issues in ecofeminism provides a historical introduction to and global perspectives on women's sociopolitical, ethical, and economic contributions to the 20th and 21st century environmental movement. Theory and political action as they interweave issues of gender, race, and class in western and non-western contexts will be emphasized. Students will read works by and about female Scientists/activists and examine their own communities, analyzing the ways that individuals, community values, and dominant institutions impact women's relationships with the environment. Students will formulate questions, responses, and interpretations through critical reading practices, class or online discussion groups, self-reflective writing, and comparative analyses.

WGS 293 Special Topics in WGS 3.
Examination of varying topics on women and/or gender from an interdisciplinary perspective at an introductory level.

WGS 300 Introduction to Feminist Theories 3.
Prerequisite: WGS 200.
This course provides an overview of primarily US and western feminist theoretical perspectives by focusing on the variety of viewpoints within feminism and their specific historical roots. More than half of the course is devoted to studying specific themes and issues in women's history. The historical background lays the foundation for examining specific feminist theories, including liberal feminism, difference feminism and black feminism/womanism. The course prepares students for further work in Women's and Gender Studies, including WGS 492.

WGS 304 Women and Men in Society 3.
Prerequisite: 3 cr. in SOC, 200 level.

WGS 305 Women and Literature 3.
Prerequisite: Sophomore standing.
Nineteenth- and twentieth-century women's literature, as shaped by the intersecting and competing claims of gender, race, sexuality, and culture. Focus on fiction, accompanied by critical readings from American studies, feminist literary criticism, and postmodern theory.
WGS 306 Gender and Politics in the United States 3.
Prerequisite: PS 201.
This course explores the role of gender in contemporary American politics. The course examines the historical course of gender politics to see how we have arrived at the present state. It investigates the activities that women and men play in modern politics—voting, running for office, serving in office, etc., and how women and men perform these activities in different ways. The course also focuses on major areas of public policy that affect women and men in different ways.

WGS 310 Women's and Gender Studies Internship 3.
Internship program. Introduction to careers that deal specifically with women's issues. Ten-hours-per-week work at a nonprofit or governmental organization. Contextualization of that experience through additional academic requirements. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

WGS 327 Language and Gender 3.
Prerequisite: ENG 101.
Introduction to the use of language by men and women. Research in Linguistics and Women's Studies addressing issues such as the acquisition of gender-differentiated language, gender and conversational interaction, sexism in language, gender issues in society, and the relationship between language, gender, and other social constructs (e.g., class, culture, and ethnicity).

WGS 330 Women and Health 3.
Women and Health utilizes an interdisciplinary approach to explore historical perspectives on health, access to health technologies, health policy research, and emerging topics in women's health. The humanities, social sciences, and biological sciences inform inquiry into "hot topics" in health policy, ethics, and the medical sciences. The health of women is dissected through a lens of gender equity and domestic and international perspectives are employed. Students are encouraged to identify and study topics of their own interest.

WGS 360 Women In Music 3.
The role of women in music as patrons, teachers, composers, and performers, placing them within the social, economic, and political framework to which they belong. Emphasis on Western Art Music and the role of women in popular music. No previous formal training in music is required.

WGS 362 Communication and Gender 3.
Prerequisite: Junior standing, COM 112.
Effects of gender on the interpersonal communication process. Construction of gendered identities via communication practices. Examination of theories of gender and the role of gender in organizational, institutional, and media communication practices.

WGS 370 Advanced Studies of Gender in Science 3.
Prerequisites: WGS 200 or (WGS 210 or STS 210).
This course is designed to provide students with an in-depth view of recent research about the influence of contemporary gender relations on science and engineering. Readings address feminist theories about sex/gender, race/class/sexualities, the social construction of science, and technological innovation. Discussions will focus on scholarship that explores how, why, and when a "gender lens" brings value to understanding nature and knowledge.

WGS 393 Special Topics in Women's and Gender Studies 3.
Special topics in Women's and Gender Studies at the 300 level for offering courses on an experimental basis.

WGS 406 Psychology of Gender 3.
Prerequisite: PSY 200, 201 or HSS 200.
Current theory and research on perceived and actual biological, social, cognitive, personality and emotional similarities and differences of men and women throughout the lifespan. The construction and consequences of gender in our society and others. Credit cannot be given for both PSY 406 and PSY 506.

WGS 407 Sociology of Sexualities 3.
Prerequisite: 3 hours SOC 200 level, 300 level, or equivalent research methods course.

WGS 410 Studies in Gender and Genre 3.
Prerequisite: Sophomore standing.
This course examines the ways in which writers have revised the literary genres to include gendered experience. It will focus on a different generic area, such as poetry, fiction, drama or autobiography, depending on its instructor.

WGS 418 Gender Law and Policies 3.
Prerequisite: 3 hours of Political Science.
Law and policy pertaining to contemporary gender issues. Examination of agenda setting, policy formation, implementation, judicial interpretation and evaluation of selected issues, such as reproductive policies, equal employment and sexual abuse.

WGS 444 Cross-Cultural Perspectives on Women 3.
Prerequisite: ANT 252 and one of the following: ANT 310,325,330 or 346.
Comparison of women in a variety of societies: western and non-western; hunting and gathering to industrialized. Cross-cultural perspective on the similarity and diversity of women's statuses and roles. Effect of gender on social position.

WGS 447 History of American Women to 1900 3.
The historical experience of women in America from the colonial period to 1890. Women's work, education, legal and political status, religious experience, and sex roles: age, class, race, sexual preference, and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 447 and HI (WGS) 547.

WGS 448 American Women in the Twentieth Century 3.
Prerequisite: 3 hrs. of History.
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles, age, class, race, sexual preference and region as significant variables in women's experience. Credit will not be given for both HI (WGS) 448 and HI (WGS) 548.

WGS 472 Women and Religion 3.
Prerequisite: one course in religious studies or women's and gender studies.
Historical, literary, and theological sources dealing with portrayals of women and women's religious experience in several religious traditions of the world through different historical periods, from ancient to modern. Impact of feminist theory on the academic study of religion; methodological issues surrounding the study of women's religious history; role of religion in shaping attitudes toward women and their status in society. Students cannot receive credit for both REL/WGS 472 and REL/WGS 572.
WGS 473 Religion, Gender, and Reproductive Technologies 3.
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the "natural". Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Analyzes the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for both REL 473 and REL 573.

WGS 492 Theoretical Issues in Women's and Gender Studies 3.
Prerequisite: WGS 200.
Examination of feminist theory. Study of formative texts in modern feminism, drawn from various disciplines within the humanities, social sciences, and natural sciences. In-depth exploration of feminist perspectives on issues of race, class, gender, sexuality, work and mothering, among others. Analysis of local and global cultural practices using feminist theoretical frameworks.

WGS 493 Special Topics in Women's and Gender Studies 3.
Examination of varying topics on women and/or gender from an interdisciplinary perspective.

WGS 506 Psychology of Gender 3.
Current theory and research on perceived and actual biological, social, cognitive, personality, and emotional similarities and differences of men and women throughout lifespan. Construction and consequences of gender in our society and others. Credit for both PSY 406 and PSY 506 is not allowed.

WGS 540 Gender Issues In Counseling 3.
Prerequisite: Graduate standing or 6 hrs. of ED or PSY.
Exploration of gender as primary identity and social construct. Emphasis on gender dynamics in counseling, client empowerment and preventive approaches.

WGS 547 History Of American Women To 1900 3.
Prerequisite: 6 hrs. of advanced history.
Historical experience of women in America from colonial period to 1890. Women's work, education, legal and political status, religious experience and sex roles: age, class, race, sexual preference and region as significant variables in women's experience. Credit for both HI (WGS) 447 and HI (WGS) 547 is not allowed.

WGS 548 American Women In the Twentieth Century 3.
Women's historical experience in America, 1890-1990. Changes in women's work, education, legal and political status, and sex roles; age, class, race, sexual preference and region as significant variables in women's experience. Credit for both HI (WGS) 448 and HI (WGS) 548 is not allowed.

WGS 573 Religion, Gender, and Reproductive Technologies 3.
Examines comparative religious ethics concerning gender marriage, parenthood, children, and the relationship of human beings to the "natural". Relates these views to new and emerging reproductive and genetic technologies. Compares the internally diverse perspectives of three major religious traditions with regard to their interpretations of these technologies. Analyzes the impact of particular uses of these technologies on the rights of women and girls. Students cannot earn credit for both REL 473 and REL 573.

WGS 593 Special Topics 1-6.
Examination of a core topic on women and/or gender from an interdisciplinary perspective at the graduate level.

WGS 633 Independent Study 1-3.

WGS 737 Sociology Of Gender 3.
Prerequisite: SOC 736 OR 731, Graduate standing.
Theories about the development and maintenance of gender. Historical development of gender stratification. How individuals "do gender" in their daily lives. Contemporary research and substantive readings about gender in public and intimate relationships.

WGS 739 Social Psychology Of Inequality 3.
Prerequisite: SOC 746 or 508.
The effects of race, class and gender inequality on the formation of group consciousness, self-evaluations, emotions, values, attitudes and beliefs. Attention to interpersonal processes through to reproduction of inequality in everyday life.

**Wood and Paper Science (WPS)**

**WPS - Wood and Paper Science Courses**

WPS 201 Sustainable Materials for Green Housing 2.
The overall goal of the class is to make the students more informed and aware consumers of materials used in housing. The class will connect the economic and energy impacts of producing common materials with the environmental impacts, e.g., carbon, water, and pollutants. The concepts of embodied energy, water use, and land impacts will be used to examine common building materials. The concept of Life Cycle Analysis will be introduced and used to evaluate the use and trade-offs for different building materials. The opportunities and trade-offs for reuse and recycling materials at the 'end of life' will also be explored.

WPS 491 Special Topics in Wood and Paper Science 1-4.
Independent study of management or technology problems selected with faculty approval or the offering of experimental courses.

**Youth, Family, and Community Sciences (YFCS)**

**YFCS - Youth, Family, and Community Sciences Courses**

YFCS 500 Supervised Professional Experience in Family Life & Youth Development 3.
In preparation for professional positions in family life & youth development, students will work with a faculty member or organizations to design a Masters capstone study project that aligns with their professional goals. Faculty supervision required.

YFCS 501 Theories in Child & Youth Development 3.
This course will critically compare and evaluate the primary developmental theories and their usefulness in predicting behavior, cognition, and social-emotional growth. The course is designed to prepare practitioners for educational service deliver to examine how theories guide practice in child and youth development.

YFCS 502 Theories in Family Sciences 3.
This course will critically compare and evaluate the major human development theories and their application to family life and youth development and examine the usefulness of theory in describing, explaining, predicting, or changing behavior.
YFCS 523 Family Relationships Over the Life Course 3.
Prerequisite: Graduate standing.
Applications of theories and research about interpersonal relationships and family dynamics to issues facing families over the life course, emphasizing the interplay of social, developmental and health factors in affecting change, continuity and well-being.

YFCS 524 Gerontology in Family Life Education 3.
Prerequisite: Graduate standing.
The course will examine the social context of aging, the lived experience of aging as reported by older persons, and the interaction of individuals and families with social institutions and community systems of care, including the “aging network”.

YFCS 531 Effective Management of Family Resources 3.
Prerequisite: Graduate student status or any PBS student.
Family resource management theory is used to examine personal financial management concepts. Family systems and stress theories will be employed to emphasize the interconnections between families, communities, resources through topics such as personal management (decision-making, time & organizational management, stress management); human and social capital (education, skill building, health, employability, relationships); physical capital (transportation, real estate, and housing); financial management (credit and debt, budgeting, retirement issues, bankruptcy).

YFCS 533 Complex Family Issues 3.
R: Graduate Standing or Permission of Instructor.
This course will examine educational intervention strategies for family issues that pose particular difficulty for Family Life and Parenting Educators. Topics include: addictions/substance abuse; child abuse and neglect; domestic abuse; illness, death and dying; divorce/mediation; step-families & single parenting; gang memberships, suicidal ideation, sexuality/teen pregnancy; and rape and other acts of violence. The course will include a discussion of evidence-based prevention and treatment options for referring clients, and a debate of the role of educators in this process.

YFCS 535 Family Health & Well-being 3.
This course will examine health and well-being issues of special concern to families, especially healthy lifestyle choices. Areas of focus will include food safety and nutrition, physical activity and well-being and healthy environments. Woven throughout the course will be the family's role in creating supportive situations related to health and well-being as well as the impact of public and social policies. Students must have completed a Bachelor's of Science.

YFCS 540 Environmental Influences on the Family 3.
Prerequisite: Graduate standing.
The course will include an examination of social, economic, and behavioral housing theory, historical and current housing policy and its relationship to the housing, neighborhoods and community development and an investigation of diverse populations and their housing/neighborhood concerns.

Theoretical and empirical literature in lifespan, family life, and parent education will be explored along with implications for issues affecting families including content, delivery, and evaluation of parent education programs. Offered either face-to-face or in person via Distance Education.

YFCS 545 Family Communication and Coaching 3.
This course examines communication in families and integrates the coach approach to communication including identifying individual and family issues; appreciating differences; discovering purpose; practicing forgiveness; resolving conflict; conducting successful critical conversations; mending relationships; effective communication; direct and indirect communication; the art of saying no; the power of words; powerful questions; work/life balance; identifying values; stress management.

YFCS 547 Family Life Coaching 3.
YFCS 547: Family Life Coaching prepares family science practitioners to meet the growing demands of improving family life through family life and parent Coaching. This graduate-level course examines family life coaching as an approach to services for families and youth. Students will be introduced to coaching as a vital service for helping families better communicate and reach goals and will explore theoretical and empirical literature in coaching. Through practice and skill building exercises, students will learn to coach and will examine the implications for future coaching practice.

YFCS 550 Family and Youth Professionals as Leaders 3.
This course examines the application of classic and contemporary theories and models of leadership to the work of community-based organizations. Students will examine leadership from diverse perspectives; then analyze the strengths and weaknesses of leadership theories and models when applied to organizational development of community-based systems.

YFCS 552 Program Development & Evaluation in Youth & Family Settings 3.
Historical and contemporary foundations of program development and evaluation in non-formal, community-based family life and youth development settings are examined including theory, research, and three holistic program development constructs: 1) planning; 2) design and implementation; 3) impact evaluation and accountability.

YFCS 553 Applied Concepts in Child and Youth Development 3.
This course explores the fundamental concepts of child and youth development (including early childhood through adolescence) as applied to programmatic and organizational contexts. A special focus is placed upon the concepts as applied to Community Youth theories & practice.

YFCS 554 Collaborations & Partnerships in Family & Youth Settings 3.
To prepare educators (formal and non-formal) to better establish, lead and manage collaborations and partnerships in family settings and those that support holistic community-based youth development organizational systems. Specific foci include: types and levels of partnerships; environmental scanning and socio-organizational linkage contextual factors affecting community collaborations; leadership factors affecting community collaborations; and human, financial and programmatic management in collaborations. Some on-campus meetings are required.

YFCS 556 Organizational Systems in Youth and Family Settings 3.
Preparation for current and future community family and youth development professionals leading and managing community-based organizations. Course includes: fundamentals of management and leadership; institutional and organizational structures; administrative and strategic planning; working with advisory and governing groups; marketing and program delivery systems; information management systems; and human resource, financial, facilities and risk management systems.
ZO 493 Special Problems/Research Exploration 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes campus facilities and resources. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer, the departmental teaching coordinator prior to the experience. Individualized/Independent Study and Research courses require a Course Agreement for Students Enrolled in Non-Standard Courses be completed by the student and faculty member prior to registration by the department.

ZO 503 General Physiology I 3.
Prerequisite: Senior standing or Graduate standing, the following courses are recommended: ZO 421, BCH 451, a yr. of physics.
Discussion of general principles of homeostasis, emphasizing importance of integrative action. Following systems studied: muscular, cardiovascular and nervous systems.

ZO 504 General Physiology II 3.
Prerequisite: PHY (ZO) 503.
Discussion of general principles of homeostasis, emphasizing importance of integrative action. Following systems studied: alimentary, renal, respiratory and endocrine systems.

ZO 509 Biology of Aquatic Insects 3.
Prerequisite: ENT 425 or Graduate standing.
Life history descriptions and identification of aquatic insects. Emphasis on behavioral and physiological adaptations to diverse habitats and the role of insects in aquatic ecosystem function and as indicators of water quality.

ZO 512 Animal Symbiosis 3.
Prerequisite: 12 hrs. of biology and zoology.
Symbiotic associations of animals including mutualism, commensalism and parasitism. The morphological, physiological, behavioral and ecological adaptations of symbionts and the complex interactions between partner species.

ZO 513 Comparative Physiology 3.
Prerequisite: ZO 421.
Comparative study of the organ systems of vertebrates and physiological processes involved in maintaining homeostatic state. Various compensatory mechanisms employed during environmental stress included.

ZO 518 Experience and the Brain 3.
Prerequisite: BIO 488 or ZO 588.
This seminar considers how an individual's behavioral interactions with the world (i.e., experience) can alter the structure and/or function of the adult brain. Emphasis will be on reading and critically discussing the primary research literature.

ZO 522 Biological Clocks 3.
Prerequisite: Graduate standing.
The anatomy, physiology and development of biological clocks in a variety of organisms, including humans. Required readings in primary literature.

ZO 524 Comparative Endocrinology 3.
Prerequisite: BIO 421 or PO 405.
Basic concepts of endocrinology, including functions of major endocrine glands involved in processes of growth, metabolism and reproduction.

ZO 542 Herpetology 3.
Prerequisite: ZO 250 and ZO 421.
The biology of the amphibians and reptiles: systematics, life history, anatomy, behavior, physiology and ecology.

YFCS 557 Volunteerism in Youth and Family Settings 3.
Preparation for current and future community-based youth and family professionals to better manage volunteers in local program service delivery. Specific foci include: voluntarism as a social phenomenon; volunteer resource management; new forms of voluntarism; and future trends in voluntarism. Restricted to graduate and post-baccalaureate students only.

In-depth examination of current and emerging issues and trends impacting volunteer involvement in community-based youth and family organizations to prepare current and future youth and family professionals to manage volunteers in local program delivery; examining contemporary research related to trends and issues, and evaluating historical and current social phenomena so as to understand their impact upon volunteer involvement and consider future challenges for volunteer administrators. Restricted to graduate and post-baccalaureate students only.

YFCS 559 Administration and Supervision of Youth and Family Programs 3.
Fundamental concepts and theories of administration and management as applied to family life and youth development organizational contexts with emphasis given to organizing and managing human resources and including business operations, planning, decision-making, organizing, staffing, communicating, motivating, leading, and controlling.

YFCS 585 Contemporary Issues in Community Youth Development 3.
Students will explore social, cultural, political, and/or organizational underpinnings of youth issues as focused in (1) issues facing community-based youth serving organizations themselves (e.g., mission, structure, funding, staffing, impact and accountability, and politics, etc); and (2) issues facing the youth audiences served by the organizations (e.g., healthy lifestyles/obesity/substance abuse, sexuality, youth-against-youth violence, career exploration and workforce development, civic engagement, academic success and school drop-out, etc.).

YFCS 590 Special Topics Family Life and Youth Development 1-6.
Special Topics Family Life and Youth Development.

YFCS 630 Independent Study in Family Life & Youth Development 1-3.
Students engaged in independently designed study guided by specific objectives constructed under the supervision of a faculty member.

Thesis Research.

Zoology (ZO)

ZO - Zoology Courses

ZO 492 External Learning Experience 1-6.
Prerequisite: Sophomore standing.
A learning experience in agriculture and life sciences within an academic framework that utilizes facilities and resources which are external to the campus. Contact and arrangements with prospective employers must be initiated by student and approved by a faculty adviser, the prospective employer and the departmental teaching coordinator prior to the experience.
ZO 544 Mammalogy 4.
Prerequisite: BIO 250.

ZO 549 Principles of Biological Oceanography 3.
Prerequisite: BIO 181.
Environmental dependencies, biological productivity, and trophic relationships in plankton, nekton and benthos; Sampling methods and experimental design; Human impacts on marine systems. Credit is not allowed for both MEA 449 and MEA(ZO)549.

ZO 553 Principles Of Wildlife Science 3.
Prerequisite: BIO 260 or BIO/PB 360.
The principles of wildlife management and their application studied in the laboratory and in the field.

ZO 582 Medical and Veterinary Entomology 3.
Prerequisite: ENT 425 and ZO 315.
The morphology, taxonomy, biology and control of the arthropod parasites and disease vectors of man and animals. The ecology and behavior of vectors in relation to disease transmission and control.

ZO 588 Neurobiology 3.
Prerequisite: BIO 250 or BIO 212 and Graduate standing.
Overview of the neurosciences, with a focus on fundamental principles in the function, structure, and development of the nervous system. Topics include neuroanatomy, electrical signaling, synaptic transmission, sensory and motor systems, neural development, neural plasticity, and complex brain function. Multiple levels of analysis, from molecular to behavioral, with an emphasis on the mammalian nervous system. Students may not receive credit for both BIO 488 and ZO 588.

ZO 592 Topical Problems 1-3.
Organized, formal lectures and discussion of a special topic.

ZO 601 Seminar 1.
The presentation and defense of original research and current literature.

ZO 602 Seminar In Biology Of Reproduction 2.
Prerequisite: ANS(PHY) 702.
Current topics in animal reproduction presented by reproductive physiologists from various Research Triangle institutions. Student presentations of research projects or library projects in area of animal reproduction.

ZO 624 Topical Problems 1-3.
Organized, formal lectures and discussion of a special topic.

ZO 631 Special Topics 1-6.
Prerequisite: Twelve hours ZO.
A directed individual investigation of a particular problem in zoology, accompanied by a review of the pertinent literature. A maximum of three hours allowed toward master's degree.

ZO 685 Master's Supervised Teaching 1-3.
Prerequisite: Master's student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ZO 688 Non-Thesis Masters Continuous Registration - Half Time Registration 1.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain half-time continuous registration to complete incomplete grades, projects, final master's exam, etc.

ZO 689 Non-Thesis Master Continuous Registration - Full Time Registration 3.
Prerequisite: Master's student.
For students in non-thesis master's programs who have completed all credit hour requirements for their degree but need to maintain full-time continuous registration to complete incomplete grades, projects, final master's exam, etc. Students may register for this course a maximum of one semester.

ZO 690 Master's Examination 1-9.
Prerequisite: Master's student.
For students in non thesis master's programs who have completed all other requirements of the degree except preparing for and taking the final master's exam.

ZO 693 Master's Supervised Research 1-9.
Prerequisite: Master's student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Master's student.
Thesis research.

ZO 696 Summer Thesis Research 1.
Prerequisite: Master's student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

ZO 699 Research In Zoology 1-9.
Prerequisite: Twelve semester credits in ZO.
Credits Arranged.

ZO 710 Sampling Animal Populations 3.
Prerequisite: ST 512.
Statistical methods applicable to sampling of wildlife populations, including capture-recapture, removal, change in ratio, quadrant and line transect sampling. Emphasis on model assumptions and study design.

ZO 718 Community Ecology 3.
Prerequisite: BO 360 or ZO 260, BO(ZO) 760; BO(ZO) 385.
Animal community structure and function. Effects of competition, predation, coevolution and disturbance on community composition. Emphasis on ecological and evolutionary controversies from empirical and theoretical approaches.

ZO 750 Marine Benthic Ecology 3.
Marine benthic systems in deep sea and in shallow waters, focusing upon abiotic and biotic processes regulating density, diversity and taxonomic and functional composition. Discussions of benthic-pelagic coupling, predation, interspecific competition, biogeography, sampling problems, evolutionary trends, trophic structure and community organization.

ZO 756 Ecology Of Fishes 3.
Physiological ecology of fishes emphasizing energetics, production and adaptations to aquatic mediums. Ecological classification of fishes and theory of resource partitioning in freshwater, estuarine and marine realms.
ZO 770 Advanced Topics In Ecology I 3.
Development of subject matter in major fields of ecology through seminars and lectures and principles illustrated by laboratory exercises and field trips. Microenvironment, population biology, community ecology, ecosystems and nutrient cycling.

ZO 790 Special Topics 1-3.

ZO 791 Topics In Animal Behavior 3.
Prerequisite: Graduate standing.
Intensive examination of selected aspects of animal behavior and their relationship to physiology, ecology and other biological fields. May be repeated for credit when topic changes.

ZO 792 Topical Problems 1-3.
Organized, formal lectures and discussion of a special topic.

ZO 802 Seminar In Biology Of Reproduction 2.
Prerequisite: ANS(PHY) 702.
Current topics in animal reproduction presented by reproductive physiologists from various Research Triangle institutions. Student presentations of research projects or library projects in area of animal reproduction.

ZO 824 Topical Problems 1-3.
Organized, formal lectures and discussion of a special topic.

ZO 829 Special Topics 1-6.
Prerequisite: Twelve hours ZO.
A directed individual investigation of a particular problem in zoology, accompanied by a review of the pertinent literature. A maximum of three hours allowed toward master's degree.

ZO 831 Special Topics 1-6.
Prerequisite: Twelve hours ZO.
A directed individual investigation of a particular problem in zoology, accompanied by a review of the pertinent literature. A maximum of three hours allowed toward master's degree.

ZO 885 Doctoral Supervised Teaching 1-3.
Prerequisite: Doctoral student.
Teaching experience under the mentorship of faculty who assist the student in planning for the teaching assignment, observe and provide feedback to the student during the teaching assignment, and evaluate the student upon completion of the assignment.

ZO 890 Doctoral Preliminary Examination 1-9.
Prerequisite: Doctoral student.
For students who are preparing for and taking written and/or oral preliminary exams.

Prerequisite: Doctoral student.
Instruction in research and research under the mentorship of a member of the Graduate Faculty.

Prerequisite: Doctoral student.
Dissertation research.

ZO 896 Summer Dissertation Research 1.
Prerequisite: Doctoral student.
For graduate students whose programs of work specify no formal course work during a summer session and who will be devoting full time to thesis research.

Prerequisite: Doctoral student.
For students who have completed all credit hour, full-time enrollment, preliminary examination, and residency requirements for the doctoral degree, and are writing and defending their dissertations.
