

# Toxicology Program

---

The Environmental and Molecular Toxicology program has established an undergraduate minor in Toxicology that is available to all baccalaureate degree students at North Carolina State University. The new minor was approved in February of 2003.

Given the importance and high level of interest in protecting human and environmental health, toxicology is a contemporary field of study that will be of great interest to many undergraduate students. This program also will provide undergraduates with exposure to two of the University's major academic thrusts: Genomic Sciences and Environmental Sciences. The interdisciplinary and applied nature of toxicology interfaces with virtually all academic programs within the College of Sciences (COS) (<https://sciences.ncsu.edu/>).
